Put simply, competitive politics required that a political party seeking wider electoral bases view castes neither as a pure category of 'interest' nor of 'identity'. The involvement of castes in politics lured 'interest' and 'identity' in such a manner that a number of castes could share common interests and identity in the form of larger social-political conglomerates. The process was of politicisation of castes, which by incorporating castes in competitive politics reorganised and recast the elements of both hierarchy and separation among castes in larger social collectivities.¹¹ These new collectivities did not resemble the varna categories or anything like a polarised class-structure in politics. The emergence of these socio-political entities in Indian politics defied the conventional categories of political analysis, i.e. class analysis versus caste analysis. The singular impact of competitive democratic politics on the caste system thus was that it delegitimised the old hierarchical relations among castes, facilitating new, horizontal power relations among them.

The process of politicisation of castes acquired a great deal of sophistication in the politics of the Congress Party, which scrupulously avoided taking any theoretical-ideological position on the issue of caste versus class. The Congress Party,

being politically aware of the change in the agrarian context, saw castes as socio-economic entities seeking new identities through politics in the place of the old identities derived from their traditional status in the ritual hierarchy. Thus, by relying on the caste calculus for its electoral politics and, at the same time, articulating political issues in terms of economic development and national integration, the Congress was able to evolve durable electoral bases across castes and to maintain its image as the only and truly national party. This winning combination of 'caste politics' and 'nationalist ideology' secured for the Congress Party a dominant position in Indian politics for nearly three decades after independence.¹² The Congress Party rarely used such dichotomies as upper castes vs lower castes or the capitalists vs working class in its political discourse. Its politics was largely addressed to linking vertically the rule of the newly emergent upper caste and English speaking—'national elite' to lower caste support. And the ideology used for legitimisation of this vertical social linkage in politics was neither class-ideology nor caste-ideology; the key concept was 'nation-building'.

The Congress Party projected its politics and programmes at the national level as representing 'national aspirations' of the Indian people. At the regional levels, the party consolidated its social base by endorsing the power of the numerically strong and upwardly mobile dominant, but traditionally of lower status, castes of landowning peasants, e.g. the marathas in Maharashtra, the reddy in Andhra, the patidars in Gujarat, the jats in Uttar Pradesh, and so on. In the process it created patron-client type of relationships in electoral politics, relationships of unequal but reliable exchanges between political patrons—the upper and dominant (intermediate) castes—and the numerous 'client' castes at the bottom of the pile, popularly known as the Congress' 'vote-banks'. Thus, in the initial two decades after independence, the hierarchical caste relations were processed politically through elections. This ensured for the Congress a political consensus across castes, despite the fact that it was presided over by the hegemony of a small upper-caste, English-educated elite in collaboration with the regional social elites belonging by and large to the upwardly mobile castes of landed peasants. The latter, however, were often viewed by the former (i.e. the 'national elite', with the self-image of modernisers) as parochial traditionalists. Still the alliance held.

This collaboration between the two types of elites, created a new structure of representational power in the society, around which grew a small middle class. This class constituted of the upper caste national elite living in urban areas and the rural social elite belonging to the dominant peasant castes as well as those upper caste members living in rural areas. The ruling national elites, although they belonged to the upper 'dwija' castes had become detached from their traditional ritual status and functions. They had acquired new interests in the changed (planned) economy, and lifestyles which came through modern education, non-traditional occupations, and a degree of westernisation which accompanied this process. The dominant castes of the regional elites, still depended more on sanskritisation than on 'westernisation' in their pursuit of upward social mobility. But they encouraged their new generations to take to modern, English-medium education and to new professions. In the process, despite their 'sudra' origins, but thanks to their acquisition of new power in the changed rural economy and politics, several peasant communities succeeded in claiming social status equivalent to the middle class dwijas.

Consequently, such communities as patidars, marathas, reddy, kammars, and their analogues in different regions were identified with 'upper castes', and not with 'backward castes'. Acquisition of modern education and interest in the new (planned) economy enabled them, like the dwija upper castes, to claim for themselves a new social status and identity, i.e. of the middle class.

At the same time, the caste identities of both these sections of the 'middle class' were far from dissolved. They could comfortably own both the upper caste status and the middle class identity as both categories had become concomitant with each other. While the alliance between the upper caste national elite and the dominant caste regional elites remained tenuous in politics, they together continued to function as a new power-group in the larger society. In the formation and functioning of this middle class as a power group of elite caste had indeed fused with class and status dimension had acquired a pronounced power dimension. But insofar as this process of converting traditional status into new power was restricted only to the upper rungs in the ritual hierarchy, they sought to use that power in establishing their own caste-like hegemony over the rest of the society. It is this nexus between the upper traditional status and new power

that inhibited the transformative potentials of both modernisation and democracy in India.

This conflation of the traditional status system with the new power system, however, worked quite differently for the numerous non-dwijia lower castes. In negotiating their way into the new power-system, their traditional low status, contrary to what it did for the upper and the intermediate castes, worked as a liability. The functions attached to their very low traditional statuses had lost relevance or were devalued in the modern occupational system. Moreover, since formal education was not mandated for them in the traditional status system, they were slow to take to modern education when compared with the upper castes. Nor did they have the advantage of inherited wealth as their traditional status had tied them to subsistence livelihood patterns of the jajmani system.

In brief, for the lower castes of small and marginal peasants, artisans, the ex-untouchables and the numerous tribal communities, their low statuses in the traditional hierarchy worked negatively for their entry in the modern sector. Whatever social capital and economic security they had in the traditional status system was wiped out through the modernisation process; they no longer enjoyed the protection that they had in the traditional status system against the arbitrary use of hierarchical power by the upper castes. On top of that they had no means or resources to enter the modern sector in any significant way, except becoming its underclass. They remained at the bottom rung of both the hierarchies, the sacred and the secular, of caste and class.

This did objectively create an elite-mass kind of division in politics, but it still did not produce any awareness of polarisation of socio-economic classes in the society. In any event, it did not create any space for class based politics. In fact, all attempts of the left parties at political mobilisation of the numerous lower castes as a class of proletarians did not achieve any significant results either for their electoral or revolutionary politics. Neither did their politics, focused as it was on class ideology, make much of a dent on Congress-dominated politics marked by the rhetoric of national integration and social harmony. In effect, the Congress could establish the political hegemony of the upper castes oriented middle class with the electoral consent of the lower castes! A very peculiar caste-class linkage was thus forged in which the upper castes

functioned in politics with the self-identity of a class (ruling or 'middle') and the lower castes, despite their class-like political aspirations, with the consciousness of their separate caste identities. The latter were linked to the former in a vertical system of political exchange through the Congress Party, rather than horizontally with one another.

POLITICS OF RESERVATIONS

It took some three decades after independence for the lower castes of peasants, artisans, the ex-untouchables and the tribals to express their resentment about the patron-client relationship that had politically hounded them to the Congress Party. With a growing awareness of their numerical strength and the role it could play in achieving their share in political power, their resentment took the form of political action and movements. An awareness among the lower castes about using political means for upward social mobility and for staking claims as larger social collectivities for a share in political power had arisen during the colonial period, but it was subdued after independence, for almost three decades and a half of Congress dominance.

It was around mid-1970s that the upper caste hegemony over national politics began to be seriously challenged. This was largely due to the social policies of the state, particularly that of reservations (affirmative action). Despite tardy implementation, towards the end of the 1970s the reservations policy that was for long inexistence in many states of the Indian union had created a small but significant section, in each of the lower caste groups, which had acquired modern education, had entered the bureaucracy and other non-traditional occupations. In the process a small, but highly vocal political leadership emerged from among the lower castes.

The process of politicisation of castes, however, came to a head at the beginning of the 1980s. This was when the Second Commission for Backward Classes (the Mandal Commission) proposed to extend reservations in jobs and educational seats to the other backward classes (i.e., to castes of lower peasantry and artisans) in all states and union territories and at the central government level. This proposal was stoutly opposed by sections of the upper and the intermediate castes who by then were largely ensconced in the middle-class. They saw the newly politicised lower castes forcing their way into the middle class (particularly into white-collar jobs),

that too not through open competition but on 'caste-based' reservations. This created a confrontation of interest between the upper and intermediate castes on the one hand and the lower castes on the other. But, it led to a resurgence of lower castes in national politics. This resurgent politics, guided by lower caste aspirations to enter the middle class, was pejoratively derided as the 'Mandalisation of politics' by the English-educated elite. The so called Mandalised politics, an euphemism for politicisation of lower castes, has since resulted in radically altering the social bases of politics in India.

Firstly, the Congress Party-dominated politics of social consensus, presided over by the hegemony of an upper caste, English-educated elite came to an end. The Congress organisation could no longer function as the system of vertical management of region-caste factions. The elite at the top could not accommodate the ever increasing claims and pressures from below, by different sections of the lower castes, for their share in power. Since mid-1970s through the 1980s, large sections of the lower strata of social groups abandoned the Congress and constituted themselves into shifting alliances of their own separate political parties. The vertical arrangement of the region-caste factions that the Congress had perfected just collapsed. The national parties – the Congress, the BJP, and the Communist parties alike – had to now negotiate for political support directly with the social-political collectivities of the other backward castes (OBCs) the scheduled castes (SCs) and scheduled tribes (STs) or with the regional-caste parties constituted by them.

Secondly, the categories of the OBCs, SCs and the STs, expressly devised for the administrative purpose of implementing the reservations policy, perhaps as an unintended consequence, acquired a strong social and political content and surfaced as new social formations in the macro-stratificatory system. They now operated in politics with the self-consciousness of socio-economic groups. Not content with proxy-representations by the upper caste – middle class elites, they wanted political power for themselves. Politics now became a contest for representation among horizontal power groups, representing social collectivities as identified by the policy of reservations.¹³ These groups began to bargain with different existing parties or formed their own new parties. Whatever survived of the hierarchical dimension of the traditional stratificatory system in

politics was thus effectively horizontalised.

Thirdly, Mandalised politics by generating aspirations among the lower castes to attain 'middle class' status and lifestyles prevented the process of class polarisation. This politics created new compulsions in the social arena. The old middle class, dominated by the upper and intermediate castes, was now compelled to admit expansion beyond itself and make spaces, even if grudgingly, for different sections of the lower castes. At the same time, lower castes while forming coalitions in politics, began to compete among themselves intensely at the social level for an entry into the growing middle class.

In sum, the state policy of affirmative action gave a big impetus to the process of politicisation of castes (as well as to de-ritualisation of inter-caste relations). The policy itself, by providing special educational and occupational opportunities to members of the numerous lower castes, converted their traditional disability of low ritual status into an asset for acquiring new means for upward social mobility. What politicisation of castes has thus done, along with the spread of urbanisation and industrialisation, is to have contributed to the emergence of a new type of stratificatory system in which the old middle class has not only expanded in numbers, but has begun to acquire new social and political characteristics.

CLASSIFICATION OF CASTE

'Classification' is a problematic, and admittedly an inelegant, concept used for describing certain type of changes in caste. As a category derived from the conventional class analysis it articulates the issue of change in linear and dichotomous terms, i.e., how (rather 'why not') is caste transforming itself into a polarised structure of economic classes? Just as the role of status and other 'non-class' elements (e.g., gender, ethnicity, etc.) is routinely ignored in analyses of class in the western society, class analysis in India underlines the role of caste elements in class and vice versa. At the other end the spectrum are scholars devoted to caste-analysis; they have little use for a concept like classification. Accustomed to viewing caste as a local hierarchy and to interpreting changes in it, in terms of the caste system's own ideology and rules, they view class elements in caste (e.g., the role of modern education, occupational mobility, economic and political power, etc.) as elements extraneous to the caste system; which, it, of course, incorporates and recast

them in its own image to maintain its systemic continuity.

Classification neither follows a linear, teleological course of change nor does it represent the caste-system's own reproductive process. I, therefore, view classification as a twofold process: (a) releasing of individual members of all castes (albeit, extent of which may vary from one caste to another) from the religiously sanctioned techno-economic and social organisation (i.e., occupational and status hierarchy) of the village system; (b) and linking of their interests and identities to organisations and categories relevant to urban-industrial system and modern politics. This process operates not only in urban areas, but also increasingly in the rural areas. The two aspects of the process are not temporally sequential, nor spatially separated. They criss-cross, and the changes become visible in form of elements of the newly emergent, macro-system of social stratification. Thus viewed, classification is a process by which castes, but more frequently their individual members, relate to categories of social stratification of a type different from that of caste.

The emergent stratificatory arrangement, however, is far from having acquired a 'systemic' form. Yet, new and different types of social and economic categories have emerged at all levels of the society by relating to which caste is not only losing its own shape and character, but is acquiring a new form and ideology. Thus, as we saw earlier, caste survives, but as a kinship-based cultural community, not as a status group of the ritual hierarchy. It has acquired new economic interest and a political identity. Its members now negotiate and own larger and multiple social and political identities. In this process, caste-identity has lost its old character and centrality. The economic and political activities in which members of a caste are now engaged are of a radically different type from the ones perpetuated by the caste system. The ritually determined vertical relationship of statuses, which encouraged harmony and co-operation among castes, has got transformed into that of horizontally competing, often conflicting power blocs, each constituted of a number of castes occupying different statuses across traditional local hierarchies. In the process, new socio-economic formations, some of 'ethnic-type', have emerged at the macro-level of the society. They compete for control of economic, political and cultural resources in the society. The idea of

upward social mobility today motivates people of all castes (not just of the 'lower' castes), collectively as well as individually. For, the quest today is not for registering higher ritual status; it is universally for wealth, political power and modern (consumerist) lifestyles. In short, caste has ceased to 'reproduce' itself, as it did in the past.

II

Emergence of a New Middle Class

All these changes have imparted a structural substantiality to the macro-stratificatory system of a kind it did not have in the past. In absence of a centralised polity, the system functioned super-structurally as an ideology of varna hierarchy. Lacking structural substance, it served as a 'common social language' and supplied normative categories of legitimisation of statuses to various local, substantive hierarchies of jatis.¹⁴ But after India became a pan-Indian political entity governed by a liberal democratic state, as we saw earlier, new social formations – each comprising a number of jatis, often across ritual hierarchies and religious communities – emerged at the regional and all-India levels. Deriving its nomenclature from the official classification devised by the state in the course of implementing its policy of affirmative action (reservations), the new formations began to be identified as: the forward or the 'upper castes', the backward castes (OBCs), the dalits or scheduled castes (SCs) and the tribals or the scheduled tribes (STs).

Unlike status groups of the caste system, the new social formations function as relatively loose and open-ended entities, competing with each other for political power. In this competition, members of the upper-caste formation have available to them the resources of their erstwhile traditional higher status and those of lower-caste formations have the advantages accruing to them from the state's policy of affirmative action. Thus, the emergent stratificatory system represents a kind of fusion between the old status system and the new power system. Put differently, the ritual hierarchy of closed status groups has transformed into a fairly open and fluid system of social stratification.

This system is in the making; it cannot be described either in caste terms or in pure class terms. However, the salience of one category in this newly emergent stratificatory system has become visible in recent years. It can be characterised as

the 'new middle class': 'New' because its emergence is directly traceable to the disintegration of the caste system, this has made it socially much more diversified compared to the old, upper caste oriented middle class that existed at the time of independence. Moreover, high status in the traditional hierarchy worked implicitly as a criterion for entry into the old middle-class, and 'sanskritised' lifestyles constituted its cultural syndrome. Both rituality and sanskritisation have virtually lost their relevance in the formation of the 'new' middle class. Membership of today's middle class is associated with new life styles (modern consumption patterns), ownership of certain economic assets and the self-consciousness of belonging to the middle class. As such, it is open to members of different castes – which have acquired modern education, taken to non-traditional occupations and/or command higher incomes and the political power – to enter this middle class.

And yet, the new middle class cannot be seen as constituting a pure class category – a construct which in fact is a theoretical fiction. It carries some elements of caste within it, insofar as entry of an individual in the middle class is facilitated by the collective political and economic resources of his/her caste. For example, upper caste individuals entering the middle class have at their disposal the resources that were attached to the status of their caste in the traditional hierarchy. Similarly for lower caste members, lacking in traditional status resources, their entry into the middle class is facilitated by the modern-legal provisions like affirmative action to which they are entitled by virtue of their low traditional status. It seems the Indian middle class will continue to carry caste elements within it, to the extent that modern status aspirations are pursued, and the possibility of their realisation is seen, by individuals in terms of the castes to which they belong.

Yet, crucial to the formation of the new middle class is the fact that while using collective resources of their castes, individuals from all castes entering it undergo the process of classisation; (a) they become distant from ritual roles and functions attached to their caste, (b) acquire another, but new, identity of belonging to middle class, (c) their economic interest and life style converge more with other members of the middle class than with their non-middle class caste compatriots.

The process of middle class formation in India is empirically illustrated by findings of a recent all-India sample survey.

The survey, based on a stratified-random sample (probability proportionate to size) of 9,614 Indian citizens (male and female) drawn from all the Indian states, except the state of Jammu and Kashmir, was conducted by the Centre for the Study of Developing Societies (CSDS) Delhi, in June-July 1996. Based on the preliminary analysis of the survey data, I provide below a broad profile of the new middle class.¹⁵

1) The middle class which was almost exclusively constituted at the time of Independence by English educated members of the upper castes, had expanded to include the upwardly mobile dominant castes of rich farmers, during the initial three decades after independence. In other words this period saw the emergence of a small rural-based middle class.

2) The survey conceived the category middle class in terms of subjective and objective variables. The subjective variable pertained to respondent's own identification as 'middle class' and an explicit rejection of 'working class' identity for himself/herself. Using self-identity as a precondition, certain objective criteria were applied for inclusion of a respondent in the 'middle class' category. Thus, from among those with middle class self-identification, respondents possessing two of the following four characteristics were included in the middle class category: (i) 10 years or more of schooling, (ii) ownership of at least three assets out of four, i.e., motor vehicle, TV, electric pumping-set and non-agricultural land (iii) residence in a pucca house – built of brick and cement, (iv) white-collar job. Accordingly, 20 per cent of the sample population was identified as belonging to the middle class.

3) The survey analysis revealed that even today, the upper and the rich farmer castes together dominate the Indian 'middle class'. While members of the two upper categories, the dwija upper castes and the non-dwija dominant castes, account for about a quarter of the sample population, they constitute nearly half of the new middle class. But this also means the representation of upper castes has reduced in today's middle class, for the old middle class was almost entirely constituted by them.

4) About half of the middle class population came from different lower-caste social formations, i.e., the dalits (SCs), the tribals (STs) the backward communities of peasants and artisans (OBCs) and the religious minorities. Considering that members of all these social formations constituted 75 per cent

of the sample population, their 50 per cent representation in the middle class is much lower than that of the upper and intermediate castes. But seen in the context of their inherited lower ritual status in the traditional hierarchy, this is a significant development. Even more significant is the fact that when members of the lower-castes, including those belonging to castes of 'ex-untouchables', acquire modern means of social mobility, such as education, wealth, political power, etc., their low ritual status does not come in the way of their entering the middle class and, more importantly, acquiring the consciousness of being members of the middle class.

5) The analysis of the survey data also revealed statistically highly significant differences in political attitudes and preferences, between members of the middle class and the rest of the population. More importantly, on certain crucial political variables (e.g., support to a political party) and cultural variables (e.g., belief in the 'Karma' theory), the difference between the lower caste and upper-caste members of the middle class was found to be much less than that between members of the middle class and their caste compatriots not belonging to the middle class.

6) The Indian middle class today has a significant rural component, thanks to the earlier inclusion in it of the rural based dominant castes and now of the members of the lower castes participating in modern economy and administration. In brief, the middle class in India today is not a simple demographic category comprising of certain ritual-status groups. It is a social-cultural formation in which as individuals from different castes and communities enter, they acquire new economic and political interests, and life styles, in common with the other members of that 'class'. Within this new middle class, caste identities of its members survive, but operating in conjunction with the new, overarching identity of middle class, they acquire a different political and cultural meaning.

To conclude, secularisation of caste, occurring along the dimensions of de-ritualisation, politicisation and classisation, has reduced caste to a kinship-based micro-community, with its members acquiring new structural locations and identities derived from categories of stratification premised on a different set of principles than those of the ritual hierarchy. By forming themselves into larger horizontal social groups, members of different castes now increasingly compete for entry into

the middle class. The result is, members of the lower castes have entered the middle class in sizeable numbers. This has begun to change the character and composition of the old, pre-independence, middle class which was constituted almost entirely by a small English-educated upper caste elite. The new and vastly enlarged middle class constituting about one-fifth of Indian population, is becoming, even if slowly, politically and culturally more unified but highly diversified in terms of social origins of its members.

Notes

[An earlier version of the paper was presented to the conference on Contemporary India in Transition, Lisbon, Portugal, 18-20 June 1998. The conference was sponsored by Fundacao Oriente as part of its larger programme of promoting north-south civilisational dialogues. The paper will appear in Peter deSouza (ed) *Transitions: Contemporary India* (forthcoming). I am indebted to Fundacao Oriente for their financial support and to Peter deSouza for his very useful editorial comments.]

- 1 The Portuguese account of caste presented here and the following discussion on the colonial discourse draw heavily on: Bernard S Cohn 'Notes on the History of the Study of Indian Society and Culture', *An Anthropologist Among the Historians and Other Essays*, Oxford University Press, Delhi, 1987, pp 139-40.
- 2 Ibid, pp 141-62.
- 3 For a detailed discussion on changes in castes under British Rule in India and the impact the colonial policies had on the caste system, see G S Ghurye, 'Caste during the British Rule' in his *Caste and Race in India* Popular Prakashan, Bombay 1962, pp 270-305. Also see Marc Galanter, 'Reform, Mobility, and Politics Under British Rule' in his *Competing Equalities: Law and Backward Classes in India*, Oxford University Press, Delhi, 1984, pp 18-40.
- 4 Collective self-awareness among the lower-caste as a people, oppressed socially and economically by the ritually high-ranking castes, developed a found organisational articulation through their participation in anti-Brahmin movements which grew in the early decades of this century. See Gail Omvedt, *Cultural Revolt in a Colonial Society: The Non-Brahmin Movements in Western India 1873 to 1930* Scientific Socialist Education Trust, Bombay 1976, see also Eugene Florschick, *Politics and Social Conflict in South India: The Non-Brahmin Movements and Tamil Separatism 1916-1929*, University of California Press, Berkeley, 1969.
- 5 Galanter sees this development during the colonial rule as having brought about some important changes in the caste-system "Caste Organisation brought with it two important and related changes in the nature of castes. The alien groups grew in size from endogenous jatis into region-wise alliances.

Concomitantly, the traditional patterns of organisation and leadership in the village setting were displaced by voluntary associations with officials whose delimited authority derived from elections" Galanter, (note 1 supra) p 23.

- 6 For a recent argument articulating a contrary position emphasising that the caste system has, even in the face of such changes, maintained systemic continuity, see A M Shah, 'A Response to the Critique on Division and Hierarchy' in A M Shah and I P Desai, *Division and Hierarchy: An Overview of Caste in Gujarat*, Hindustan Publishing Corporation, Delhi, 1988, pp 92-133. Shah sees horizontal divisions as intrinsic to the caste-system itself, representing another principle of caste organisation which has always operated in juxtaposition with 'hierarchy'. The horizontal divisions in caste, in his view, are thus produced and reproduced as part of the continuous process within the system, a kind of change that a system undergoes for its own survival and maintenance. Whereas for his interlocutor in the debate I P Desai, the horizontal divisions which are prior to caste but were integrated in the system of castes by the principle of ritual hierarchy, are now breaking away from that hierarchy and interact in horizontal social and political spaces. In this sense, for Desai, horizontal divisions represent a new principle for the emerging stratificatory system which has undermined the caste principle of ritual hierarchy, I P Desai, 'A Critique of Division and Hierarchy' in the above cited *Division and Hierarchy*, pp 40-49.
- 7 For an illuminating discussion on the changed relationship between ritual status and occupation and its implications for the emergence of a new type of stratificatory system in India, see I P Desai, 'Should "Caste" be the Basis for Recognising Backwardness?' *Economic and Political Weekly*, Vol 19, No 28, July 1984, pp 1106-16.
- 8 Of late, such recognition of systemic changes in caste is reflected in the mainstream sociological writings. For example, M N Srinivas in one of his latest writings has characterised the changes that have occurred in the caste-system as *systemic* in nature "As long as the mode of production at the village was caste-based, denunciation of inequality from saints and reformers, or from those professing other faiths proved ineffective. It was only when, along with ideological attacks on caste, education and employment were made accessible to all, and urbanisation and industrialisations spread that *systemic changes* occurred in caste" (italics mine). See 'Introduction' in *Caste: Its Twentieth Century Avatar*, M N Srinivas (ed), Viking, Penguin India, New Delhi, 1996, p XIV.
- 9 For an overview of comprehensive, systemic changes that have occurred in local hierarchies of castes in rural areas see G K Karanth, 'Caste in Contemporary Rural India' in M N Srinivas (ed) *Caste: Its Twentieth Century Avatar* (note 7) pp 87-109. Karanth, in his concluding remarks to

the essay, observes: "In the first place, it may not be appropriate any more to refer to caste in rural India as a 'system'. Castes exist as individual groups, but no longer integrated into a system, with the dovetailing of their interests" (106).

- 10 The writings and politics of Ram Manohar Lohia, a renowned socialist leader, however, constituted an exception to this approach of the Left parties to political mobilisation. In his view, horizontal mobilisation of lower castes on issues of social justice had greater political potential for organising the poor and deprived populations of India than the ideology of class-polarisation which, in his view, lacked an empirical, social-basis for mobilisational politics. See Ram Manohar Lohia, *The Caste System* (Ram Manohar Lohia Samata Vidyalaya Nyas, Hyderabad, 1964). Also see, D L Sheth, 'Ram Manohar Lohia on Caste in Indian Politics', *Lokayan Bulletin* (Vol 12, No 4, January-February 1996) pp 31-40, also D L Sheth, 'Ram Manohar Lohia on Caste, Class and Gender in Indian Politics', *Lokayan Bulletin* (Vol 13, No 2, September-October 1996) pp 1-15.
- 11 The concept 'politicisation of castes' was first used by Rajni Kothari in early 1970s, to describe changes that had occurred in the caste-system with its involvement in democratic politics. See 'Chapter 1: Introduction' in his *Caste in Indian Politics*, (22) pp 3-25.
- 12 Rajni Kothari in his pioneering work on the Congress Party saw this aspect of Congress politics, i.e. expanding its social base through management of caste-based political factions regionally and seeking consensus on issues of development and modernisation nationally, as crucial to the Congress Party's prolonged, political and electoral dominance. See Rajni Kothari, 'The Congress System in India', *Asian Survey* (Vol 4, No 12, December 1964) pp 1161-73; see also 'The Congress System Revisited', in his *Politics and People: In Search of Humane India*, Vol 1 (Ajanta Publishers, Delhi, 1989) pp 36-58.
- 13 See D L Sheth, 'Reservations Policy Revisited', *Economic and Political Weekly*, November 14, 1987, pp 1957-87.
- 14 M N Srinivas, 'Varna and Caste' in *Caste in Modern India and Other Essays*, Asia Publishing House, Bombay, 1962, pp 63-69. Also see, Andre Betelle, 'Varna and Jati', *Sociological Bulletin*, Vol 45, No 1, March 1996, pp 15-27.
- 15 I would like to emphasise that presented here are preliminary findings of the survey. The author and the research team at the CSDS are in the process of refining the index of middle class membership. In the final analysis percentage figures for the representation of social formations into the middle class and for the magnitude of the middle class may slightly change (by about ± 1 to 2 per cent difference). I have reported here 'work in progress' and not a completed analysis of the composition of the middle class, which will soon appear in a separate monograph. The idea is to give a broad, even if bit tentative, picture of the emerging new middle class.

Anatomy of BJP's Rise to Power

Social, Regional and Political Expansion in 1990s

Oliver Heath

The political and regional expansion of the BJP has been characterised by a three-tiered growth in its social appeal. In its homeland of primary states its core of social support, the upper castes, has remained intact; in the secondary states, its new social base comprises OBCs as well; in the tertiary states where it has made giant strides the scheduled castes and the Muslims have emerged as supporters and this has largely been because of its allies. By delicately redefining itself and its social base, the party has been able to venture out from its nesting ground in the north and spread its wings.

THE spectacular rise of the BJP is one of the major political stories of the 1990s. During the last decade the party has undergone a rapid geographical and political expansion, the like of which has never been seen before. From its lowly position in 1989, when the BJP was a small localised party with a political presence restricted to just a few states in the Hindi heartland, the acquisition of new territory and new allies has transformed it into being the main political force in India with a mass national following. The aim of this paper is to explore the effect that these expansions have had on the social base of the BJP. Has its appeal widened to attract voters from different social backgrounds? Or has it merely strengthened its hold on its traditional support base? Do the allies give the party an entrance in to new states and new sections of society? These are the questions which need to be answered.

National aggregations provide a useful starting point from which to carry out our investigation. By looking at the overall picture we can gain a sense of what, if anything, has changed. However, the BJP's rise in popularity has not been evenly spread across the country. The regional expansion of the party can be seen to have taken shape in three distinct waves. The first wave took place in the 1950s and early 1960s when the BJP's historical predecessor, the Jan Sangh, first became a significant political force at state level. These 'primary' states are the states where the Jan Sangh emerged as a viable opposition party in the 1950s and 1960s. The second wave includes the 'secondary' states, where the Jan Sangh, and then after 1980 the BJP, were present before the 1989 boom, but were only minor opposition, winning just a few seats in the 1960s, 1970s and 1980s. The third wave is marked by the 1989 election, when the BJP emerged as a force in many of the 'tertiary' states. By looking at the social

expansion with reference these different levels of regional expansion, we can attempt to identify the forces that lie behind the party's emergence as a national party.

I Social Base

It is well known that support for the BJP has tended to be more concentrated among the upper castes and the wealthy, and it's weakest among the Muslims and the underprivileged. But how do these different sources of support compare? Is caste a more significant factor than class? How much of a role do age and gender play? It is important to answer these questions so that we have reference point to relate social expansion to.

Bivariate analyses may to some considerable extent duplicate the significance of factors. For example, educational level is closely related to social class, therefore, education and class tables may simply be redescribing the same phenomena rather than telling us anything new. What is interesting is to examine the impact of one variable on the vote for BJP and its allies (BJP+), controlling for the other variables. In other words, among people of the same community or class, does education still make a difference to the way people vote?

To explore this question we carry out a multivariate logistic regression in which we simultaneously include community, class, education and so on rather than looking at them separately. We use logistic regression, which is the appropriate technique when we have a binary dependent variable.

We include in our model community, class, education, age, gender and locality. These variables are all treated in exactly the same way as in cross-tabulations, but all are included simultaneously. Table 1 shows the parameter estimates. These estimates can be interpreted as fitted log odds ratios. If we exponentiate them, we obtain the usual odds ratios which are

more easily interpreted. These are the ones shown in the second of the split columns. These odds ratios show the fitted odds of supporting the BJP and its allies in the particular group in question relative to the overall odds. These are what is known as 'deviation contrasts'. If the fitted odds ratio is greater than 1, this indicates that the group in question is relatively likely to support BJP+, while if the odds ratio is less than one, it indicates that that group is relatively unlikely to support BJP+.¹

The magnitude of the parameters tell us by how much the particular groups differ from the overall electorate (controlling for the other variables in the model). Thus if the fitted odds ratios are close to 1, either just above or just below, then we can say that the groups in question are relatively similar in their support for BJP+. The further apart they are, the more different the group's voting patterns are.

Table 1 shows the parameter estimates for each of the variables. To some extent the support base of the BJP resembles, if not the elite, then definitely the middle and upper classes. That is to say, that although the most advantaged members of society may not always be the most likely to vote BJP, the most disadvantaged are at any rate the least likely. Although it may be tempting to say that the BJP is therefore a party that represents social and economic privileges, none of the evidence is really strong enough to support this. On the whole the degrees of polarisation within the variables are relatively weak, that is with the noticeable and distinct exception of community.

Controlling for all the variables, it is the upper castes that are by far the most likely to vote BJP. This means that although graduates are more likely than illiterates, and men more likely than women, and so on, caste over-rides their influence.

Table 2 gives a summary of how significant each of the variables are in effecting the vote for BJP+. Chi2 is a measure for

the difference between the expected and the observed results. The expected results assume a null association. That is, one would expect all groups within the variable to give the same degree of support to the BJP+. The greater the difference between the relative levels of support, the greater the Chi2. Community and class, and to a lesser extent sex, age and locality, all play a part, although community is by far and away the most significant. Therefore, if the social base of the BJP has expanded, the key variable that we need to measure it with reference to is community.

II Social Expansion

By looking at the internal composition, or column percentages, of the BJP+ we can analyse the distribution of the different community's within the party. This tells us what percentage of BJP voters are upper caste, OBC and SC, etc. Secondly, we can look at the degree of support that each community gives to the BJP. Although all the communities may vote BJP to some extent, the row percentages and odds ratios tell us which community offers the greatest and least support. However, the row percentages only show absolute increases, and not relative increases. To see whether the communities exhibit any change in their voting patterns, or are just being swept along with the tide, we need to look at the odds ratios. It is important to look at the picture from both sides. Inflow tables tend to highlight the cross-cutting of cleavages, whereas the row percentages show to what degree people vote along caste lines. Although similar information, in terms of change, can be gained from both approaches; the distinction remains important. Thirdly, we can look at the overall effect of community on voting. Phi and Chi2 both measure its aggregate significance by quantifying the level of polarisation along community lines in one election.

As the multivariate analysis led us to suspect, it is the upper castes that form the most dominant section of BJP+ support. This was still the case in 1998 as it was in 1991, so in that respect it would seem that little has changed. However, the degree to which they predominate has undergone major changes. Table 3 shows that there has been a real and significant shift in the social composition of the BJP+. The proportion of BJP+ voters who are upper caste has fallen by 10 per cent since 1991. This shift away from the heavy reliance of upper castes has been matched by gradual growth in representation from all of the other communities. The growth that has been most pronounced is amongst

the OBCs, whose presence has increased by 4 per cent, although there has also been an increase in the other social groupings of SC (3 per cent), ST (2 per cent) and Muslim (1 per cent). However, these counter-growth have been relatively small, and could just be the result of standard sampling error. We should not therefore read too much into them at this stage.

The row percentages in Table 4 show the degree of support that each community gave to the Jan Sangh in 1967 and to the

BJP+ in 1991, 1996 and 1998. The 1967 data need to be treated with some caution. Not only is the overall sample size quite small and restricted to only male respondents, but also the Jan Sangh share of the vote is small. Therefore, the sample may not have accurately picked up the Jan Sangh voters. However, broadly speaking we can say that the upper castes gave far more support to the Jan Sangh than the other community groups did, which is also true for the BJP 30 years later. In this sense then,

TABLE 1: SOCIAL BASES OF BJP VOTE, 1991, 1996 AND 1998 - LOGISTIC REGRESSION PARAMETER ESTIMATES

there has been a strong degree of continuity between the respective social profiles of the two parties.

However, in terms of finer analysis, we are unable to draw any other robust links between the two parties. Instead, what we can do is to see what has happened to the BJP since 1991. The row percentages show that during the 1990s there has been absolute growth in support for the BJP+ across all the communities. However, to see whether this rise in popularity has been evenly dispersed across the board we need to look at how the odds ratios have changed.

In the hierarchy of support by community little has changed since 1991. Relative to the overall electorate, the upper castes still give the greatest support to the BJP, followed by the OBCs, the scheduled tribes, the scheduled castes and the Muslims, respectively. However, the odds ratios show that there has been a relative decrease in the support from the upper castes. Even though more upper castes voted BJP+ in 1998 than in 1991, their overall dominance has been reduced by the greater propensity of the other community's to vote BJP+.

The odds ratios for the upper castes were their highest in 1996. However, they significantly fell in 1998. Even though the odds ratios for the upper castes voting BJP+ were higher in 1991 than in 1998, the overall effect of community was lower. This indicates that the social cleavages were not as pronounced as they later became. The Chi2 for community was at its highest in 1996, and then dropped a little in 1998. However, the disadvantage with using Chi2 as a comparative measure between samples, rather than a comparative measure of variables within the same sample as was used in Table 2, is that it is sensitive to the size of the sample. Thus bigger values are expected when big samples are used. To some degree then the rise in Chi2 might merely reflect the overall rise in popularity for the BJP and not indicate a strengthening of social cleavages as might first be assumed. To verify this we use Phi. The Phi results support what Chi2 told us.

Therefore social profile needs to be explored from two angles. Firstly, what is the relationship between the move away from upper castes, and the rise in the other communities? And secondly, what is the overall effect of community? Having examined how the overall shape of the BJP and its allies has changed, we next need to examine how these profiles compare to those in the three waves of BJP expansion.

III Regional Expansion

Does the social profile of the BJP remain constant from the time of its establishment? Does the social profile take the same shape in each wave? How do the different social profiles change over the course of time?

To answer these questions we will test the validity of three hypotheses. Firstly, that expansion takes the form of a top-down conversion. That is, it enters through the upper castes, who have traditionally been the most likely to vote BJP and would therefore be the most receptive to its arrival, and then draws in support from the other community groups afterwards. The second hypothesis is that the social profile on entry reflects the BJP+'s profile at that time. In this respect we would expect to see similar profiles in each of the regions. Thirdly, in each phase, or penetration, the party redefines itself and explicitly tries to appeal to new voters. In this instance there would be markedly different profiles in each of the regions. Perhaps unsurprisingly, the states where the BJP has had the longest political presence are the states where the BJP is still most popular. The secondary states are also the second most popular. In 1996 the BJP+ vote share increased noticeably, and the party is now only marginally less successful than it is in the primary states. In the tertiary states the BJP had an almost non-existent presence before 1989. However, it is in these states that its growth has been most dramatic, rising from 10.2 per cent in 1991 to 35.4 per cent in 1998.

Table 6 shows the inflow of where the BJP+'s support comes from. Whereas Table 5 showed the percentage of people in each region who voted BJP+, this table shows each region as a percentage of the total number of people who voted BJP+. That is, in 1998 31.4 per cent of the people who voted BJP+ came from the primary states. The table illustrates how the BJP's reliance on the primary states has dwindled over the years. Although the BJP is most successful in the primary states, in 1998 the largest number of its votes came from the tertiary states. This makes the party's expansion into this area all the more significant.

Table 7 shows the column percentages for BJP+ support in each of the regional groupings. At first glance the table seems to paint a rather confusing picture. However, by focusing on the changes that have taken place in each region, we can gain some indication of what each ones enduring characteristics are, and thus begin to test our hypotheses.

The proportion of upper castes within the BJP fold in the primary states has not changed significantly over the three elections, with a slight fall between 1991 and 1998 the values have merely oscillated 1 percentage point either side of the average, and 1996 value, of 41 per cent. Similarly its proportion within the tertiary states has not altered much either. That leaves us with the secondary states. It is within this region that the big changes have occurred. The proportion of upper castes in 1991 was 54 per cent, marking it as the most upper caste reliant region of all. However, in 1996 its share fell by 12 percentage points, which was further consolidated by an additional fall of 2 percentage points between 1996 and 1998. In terms of a move away from the upper castes it is therefore in the secondary states that the major changes have taken place.

How do these changes compare with what has been happening with the other castes? The OBC share has been slightly erratic in the primary states. A slight rise in its share between 1991 and 1996 was followed by a slightly bigger drop. The overall impression though is of relative continuity, in at least insofar as all the changes have basically cancelled each other out. In the tertiary states there has been a noticeable fall in its share. However, in

TABLE 3 BJP+ SUPPORT BY COMMUNITY, COLUMN PERCENTAGES 1991, 1996, 1998

	1991	1996	1998
Hindu Upper	52	48	42
Hindu OBC	34	35	38
SC	8	10	11
ST	5	6	7
Muslim	1	2	2
N	1008	2318	2799

Notes: (i) The proportion of the community groups within the samples have been adjusted so that their size is standardised over time. In each year the percentages of the groups have been set so that Hindu Upper = 27 per cent, Hindu OBC = 31 per cent, SC = 17 per cent, ST = 8 per cent, Muslim = 12 per cent and Other = 5 per cent. The SC, ST and Muslim percentages are taken from 1991 Census figures. The Hindu Upper and Hindu OBC percentages are derived from the average of their respective sizes from the NES71 and NES96 sample distributions. Other is a residual category. (ii) Because 'others' are a heterogeneous grouping, changes in their voting behaviour are essentially meaningless. Thus to eliminate their effect on the overall changes, which might disguise changes that are happening in other groups, they have been omitted from the calculations. However, their removal does not substantially alter the pattern of what has happened, it just allows for a slightly more nuanced analysis.

the secondary states its share has consistently gone up, rising from 34 per cent to 37 per cent to 40 per cent. The scheduled castes and Muslims have remained fairly stable in the primary states, and made some gains in the secondary and tertiary states. The scheduled tribes have increased their share in the primary states, and remained fairly stable in the secondary and tertiary states, although their share did drop a fraction in 1998. However, for the small groups, such as the scheduled tribes and Muslims, even small changes in their proportion within BJP can be the result of significant changes in their voting behaviour. Therefore, it is a good idea to see how their odds ratios have changed.

The row percentages offer an interesting insight into the voting behaviour of the Muslims. In 1991 a negligible number of Muslims voted BJP in the secondary and tertiary states. They are the last group to join the BJP handwagon. However, as the BJP established itself in these states they voted for it in greater numbers. The voting seems to go in waves. In 1991 they only voted BJP in the primary states, where the party was already firmly entrenched. In 1996 they voted in all regions, in greater numbers in the primary states and less so in the tertiary states. In 1998 they again voted in all regions, but this time just as much in the tertiary states.

This pattern leads to two possible conclusions. Firstly, that as the last to enter, they are led by the other communities, thus following a top-down conversion process. But the fact that their growth was most evident in the tertiary states indicates that the BJP+ appeals to them (or vice versa) when it sets itself up anew.

The odds ratios provide us with the firmest basis from which to examine our hypotheses of social expansion. In order for the top-down process to give an accurate representation of what has happened, we would expect to see the highest odds ratios for the upper castes, and the lowest odds ratios for the Muslims and scheduled castes, in the tertiary states. This is clearly not the case as both Muslim and scheduled caste support is weakest in the primary states and strongest in the tertiary states. And the upper castes odds ratios in the primary states are substantially higher than their odds ratios in the tertiary states. Thus, due to the lack of corroborating evidence we must refute the top-down hypothesis.

The second hypothesis, that the party carries its present profile into the states that it penetrates, is slightly more problematic. It is somewhat difficult to ascertain whether the BJP takes its profile with it when it enters new regions for two

reasons. Firstly, we do not have adequate data for the emergence of the party in the secondary states, and given what we have, we cannot assume that the profile at entry follows the same course in each of the regions. That is, hypothetically, even if the early profile of the secondary states reflected the profile of the primary states of that time, they may both have evolved in different ways over the course of time. Therefore, even though the profile of the secondary states does not closely resemble the profile of the primary states now, or even since 1991, we cannot rule out the possibility that it once did. However, our data series does manage to capture the initial expansion into the tertiary states, and its gradual consolidation, so this gives us a more robust footing from which to speculate. Given this, a further question arises. That is, which profile would carry through to the tertiary states, that of the primary states, or that of the secondary states? The question becomes redundant on analysis. The profile in the tertiary states bears little resemblance to either primary or secondary in 1991, 1996 or 1998, so we must refute the theory. This leaves us with third and most likely alternative. That is, the party redefines itself and tries to appeal to different sections of society each time it establishes itself on new territory.

In 1991 and 1996 the tribal vote becomes relatively stronger the further the region is away from the core. However, this pattern is clearly upset by the 1998 results, where it is strongest in the primary states and weakest in the secondary states. The major growth has obviously taken place in the primary states, but why is this? Perhaps this tells us something about the power of mobilisation. The tribals' natural impulse to vote for the BJP more is when the party is an outsider. However, as a group to be mobilised, the tribals are relatively untouched. Thus the BJP is able to appeal to them in a way that it could not do to the OBCs, SCs and Muslims while still maintaining the support of the backward upper caste faithful. In this way it follows the classic upper caste — scheduled caste mobilisation strategies that were employed by Indira Gandhi in the 1970s. Thus, in light of the changes in the composition of the BJP+ in the different regions that we noted from Table 7, we must accept that the party shows a preference to mobilising different communities in different regions. In this sense then it does redefine itself.

In terms of the overall effect of community we can see that the Chi2 and Phi values decrease as the region moves further away from the primary states. This

indicates that caste is less significant in the states the BJP has most recently infiltrated, and is still most significant in the old guard states where the BJP first emerged. What does this tell us? Firstly, that the cleavages that were set up when the Jan Sangh emerged have by and large remained in tact. Although the party has grown in these states, it has never managed to rid itself of its initial cleavages, but then, neither has had to. The tertiary states are still less caste-based than other states, but whereas the primary states have only increased marginally since 1991, and the secondary states have even decreased, there has been a somewhat alarming rise of community polarisation in the tertiary states.

IV Political Expansion

Allies are an operational indicator of expansion and political credibility. The biggest electoral gains that the BJP combine

made were in the regions where it had allies. How does the profile change with this inclusion? Do the allies give the party an entrance into other social groups? Or do they appeal to traditional BJP voters? Do they play a pivotal role in the party's reinvention? Do the allies offer a significant account for the widening social base of the BJP in the secondary and tertiary states? In the same state how does support for the BJP and its allies compare? To examine how respective sources of support for the BJP and its allies differ we disaggregate the state groupings in which the BJP has fought alongside allies. In 1991 and 1996 this was only in the secondary states, and in 1998 it was the secondary and tertiary states.

In the secondary states in 1991 all the communities gave greater support to the BJP than to its allies. However, in 1996 the balance of power swung, with the allies claiming roughly equal, and

marginally greater support amongst the OBCs and upper castes, respectively. The scheduled castes and scheduled tribes still gave greater support to the BJP than to the allies, and the Muslim vote was divided evenly between the two. In 1998 however, the allies increased their support relative to the BJP amongst the scheduled castes as well, leaving only the scheduled tribes, and the Muslims to a small extent, preferring to vote for the BJP than its allies.

Table 11 shows the complete picture of support by region for the BJP and its' allies. The social base of the allies needs to be analysed both internally, comparing the differences between regions and over time, and externally, comparing it to the profile of the BJP.

The allies have two types of social base. The first wave of allies, those in the secondary states, has much more support amongst the upper castes and OBCs than they do amongst the other communities. Compared to the tertiary allies, the odds ratios for the SC, ST and Muslims are very low in the secondary states. However, the profile is somewhat different in the tertiary states. Although the odds ratios are still highest, by quite a margin, for the upper castes, there are a number of communities with odds ratios around, or just below one. The scheduled castes, scheduled tribes and Muslims, all have odds ratios that, relative to their other odds ratios in other regions and years, are high. Although the odds ratios for these communities do not set individual precedents, they do mark a significant collective increase. This is reflected by the very low values of Phi and Chi2, of which the Phi value is the lowest ever, second only to the value for the tertiary states in 1991.

By comparing the social profile of the BJP with that of its allies in the tertiary states in 1998 we can see how the inclusion of allies effects the social base of the BJP. In the tertiary states the upper castes, SC, ST and Muslims, all offer relatively greater support to the allies than to the BJP. This leaves the BJP somewhat OBC dominant, and weaker among the other castes. This suggests two things. Firstly, in the tertiary states the upper castes do not have the same affinity with the BJP as they do in the primary states, which may be partly due to the fact that in the tertiary states the BJP is not the preserve of the upper castes. Thus, the upper castes, the SC, ST and the Muslims all prefer the allies to the BJP, although probably each for somewhat different reasons.

To what extent has the BJP gained from its acquisition of allies? The social base

of the BJP cannot be isolated purely by looking at who votes for the BJP. Depending upon seat sharing arrangements, voters who are committed BJP supporters may be forced into voting for one of their allies. Therefore, an interesting exercise is to see which party respondents would have voted for if there had been no alliances, in 1998. Table 12 shows the parties that respondents said they would have voted for if there had been no alliances. In the secondary states the BJP not only retains more of its own vote, but also claims more of the allies vote compared to the tertiary states. This indicates that the leaning of those who voted for the allies is much stronger towards the BJP in the secondary states. Due to the reduced sample size that table produces, there are not enough cases to say anything meaningful about the STs and Muslims. Therefore they have been discounted. However, what is clear is that a significantly higher percentage of upper castes would have voted BJP in the secondary states than in the tertiary states. This gives greater support to the view that the allies in the tertiary states appeal to the less traditional BJP voter, thus giving the BJP an entry into social groups that would not normally vote for them.

CONCLUSION

So how has the BJP expanded? What effect has its regional and political expansion had on its social base? The regional expansion of the BJP has been inter-twined with a distinct three tiered growth in its social appeal. To a large extent the presence of its political allies have aided this process, and allowed the party to gain a foothold in new territory. The relationship between the three forms of expansion is undoubtedly connected. However, as far as causal relationships go the direction is unclear. One can safely assume though that the BJP has been an active participant in determining which course its social expansion takes. And as

for those who say that the BJP has little in common with most of its allies, it would seem that the selection criterion relies more on the allies' social appeal than on their ideological stance. In this respect the mobilisation strategies that the BJP have employed have been very carefully orchestrated.

In each successive step that the BJP makes away from its homeland of the primary states, the groups that have expanded the most also move a step down the ladder of the party's traditional support base. Thus in the primary states, which represent the core of the party's stronghold, its core source of social support, that of the upper castes, has remained in tact. The only other community that has been significantly mobilised in this region is the scheduled tribes.

Moving one step away, into the secondary states, it is the OBCs, who overall are the second most likely group to vote BJP, who have made the most significant increases in their propensity to vote for the party. The states in this region have

a profile more similar to the primary states than the tertiary states do. This is illustrated by the social base of the allies, which is relatively strong amongst the upper castes and OBCs and relatively weak amongst the other communities. It thus reinforces the overall mobility drive, with both BJP and allies working in tandem to appeal to similar sorts of people.

The third tier of scheduled castes and Muslims have emerged most strongly in the tertiary states. In these states the BJP's reliance on its allies, both as a vote winner and as an entry point into other social groupings, is at its strongest. Whereas in the secondary states the partnerships mainly took the form of BJP led alliances, in the tertiary states the alliances are generally regionally led, with the BJP supporting from the outside. Party's such as the AIADMK, TDP and Trinamool Congress, and to a lesser extent the BJD, carry more weight locally than the BJP. Thus the BJP prospers by association, and without them would most probably become marginalised.

It is in the tertiary states that the less traditional BJP voters have become more enfranchised, similarly it is the presence of the allies that brings most support from

these social groups. With the BJP on its own gaining little favour with anyone other than the upper castes and the OBCs, its political future lies in the hands of its allies. The biggest gains that the BJP made have been in these states, which now also constitute its largest source of support. So, as the BJP pushes to establish itself at the centre once again, the role of the allies in these states will become more important than ever.

In a sense then, there are three parties. Admittedly they are not completely independent ones, but nonetheless – they are each distinctive in their own way. Each one has played a significant role in helping the BJP become the national party that it is today. It has only been by delicately redefining itself and its social base that the party has been able to spread its wings and leave its nesting place of north India. Although much of the momentum for this change has come from within the party, the transition has only been finally possible because of the help it has received from parties outside. This help though, seems to be somewhat illusory. The allies, especially in the tertiary states, have not provided a push for the BJP to reach a firm

hand-hold, but have provided the hand-hold itself. If the allies were to let go then in all likelihood the BJP would have a long way to fall.

Notes

[Many thanks are due to Yogendra Yadav and Anthony Heath, who were both great sources of help in preparing the outline for this paper, and to the CSIDS Data Unit in general, and Himanshu Bhattacharya in particular, for assistance with the aggregate data.]

The United Colours of Congress

Social Profile of Congress Voters, 1996 and 1998

Anthony Heath
Yogendra Yadav

Though the decline of the Congress in Indian politics has been discussed, the changes in the social profile of Congress voters has been ill-researched and therefore little understood. Congress has been a 'catch-all' party and at the aggregate national level its support has cut across caste and class divides. But a study of election results from individual states shows that Congress support does vary with caste and class depending on its major rival. At one time the Congress had acquired and cultivated a diverse social profile through active political mobilisation. Today, it is reduced to picking up the leftover votes that other political parties have not mobilised.

. . .

I Introduction

THE decline of the Congress is in many ways the story of Indian politics in the 1990s. In popular as well as academic accounts the changes in the structure of political competition in this decade are seen as a consequence of the decline of the Congress which is largely seen as an autonomous occurrence. The decline has been so swift and yet so decisive that it is easy to forget how surprising it was. Like most entrenched parties of long standing democracies, the Congress too has lived to read many of its obituaries. Not only did it survive the death of Nehru, it also survived the virtual dismemberment of its organisational structure under his daughter. It survived the loss of power at the centre and then even the death of Indira Gandhi. Against this background the steady decline in the national vote share of the Congress in all the Lok Sabha elections after the unprecedented victory in 1984 is indeed surprising. The forthcoming mid-term election may slowdown or at best halt this steady decline, but is unlikely to result in its reversal.

While the story of the decline of the Congress at the national level and its marginalisation in some crucial states is too well known to need recapitulation here, one crucial aspect of the story is rather ill-researched and therefore little understood. This aspect concerns the changes in the social profile of Congress voters that accompany its overall decline. In the past the most notable feature of Congress support has been its evenness, both geographical and social. It appeared to have drawn its support equally from all parts of the spectrum, and this gave Indian politics the appearance of politics without distinctive social cleavages [see for example Sheth 1975]. In popular wisdom

the Congress was seen as a party that always drew upon captive 'vote banks', especially among the socially disadvantaged groups, and its decline is seen as a function of the loss of these vote banks. Even those who do not buy the mythology of completely polarised 'vote banks' do think that the decline of the Congress is a function of the erosion in its capacity to retain the political loyalty of the socially disadvantaged communities all over the country. Survey evidence of the elections in the 1990s, however, seems to contradict this understanding. Various accounts of the social basis of Congress support suggest that the party continues to be the 'catch-all' formation it always was. It continues to draw almost equal support across the various social cleavages that have been articulated in the arena of electoral politics.

In this paper we seek to resolve this tension between political perception and survey evidence. We believe that an analysis of the social composition of the Congress vote in the 1990s is of broader significance than the Indian context. It illustrates the pressures faced by a catch-all party when it faces competition from cleavage-based formations. The rise of parties such as the Bharatiya Janata Party (BJP) and the Bahujan Samaj Party (BSP) which do, more or less explicitly, appeal to distinctive social groups, indicates the rise of cleavage politics in India. This is in sharp contrast to western democracies where the talk is all about the decline of cleavage politics [Franklin et al 1992]. The decline of the Congress illustrates the failure of a catch-all party to handle cleavage-based pressures. A careful analysis of this failure needs to take into account another autonomous dimension, namely, that of regional differentiation. The last decade, or the 'third electoral system' (see Yadav in this issue), has seen an increasing geographical fragmentation

of the Indian electorate, with major regional parties strengthening their position. State, rather than the nation, has emerged as the effective arena of political choice.

Our concern in this paper is with the implications of these developments for the basis of Congress support. We argue that the decline of the Congress is linked to both these aspects, the social and the regional. At the all-India level Congress still draws its support fairly evenly from across the social spectrum. But our contention is that this is largely a consequence of a variety of contradictory tendencies at the state level which cancel out overall. This point has been made before by Chhibber and Petrocik (1990) who drew attention to the geographical diversity of Congress politics. They were able to show that the social basis of the Congress vote varies from state to state although they stopped short of providing a systematic account of the nature of this geographical diversity.

We agree with Chhibber and Petrocik that, in order to understand contemporary Indian politics, it is essential to disaggregate and to move down from the all-India level and to look at finer distinctions within the Indian electorate. We go further and argue that a key factor in explaining the geographical diversity in Congress support is the nature of party competition. For example, we shall show that Congress draws on different social groups when it is in competition with the BJP than it does when it is in competition with the Left Front. This suggests that we should divide up the Indian electorate according to the nature of party competition in each state. This has the dual advantages of having a theoretically powerful basis of classification and of having reasonably large groupings where our sample surveys can yield reliable results. The last point is not trivial, for one major problem with

Chhibber and Petrocik's analysis is that they were reduced to very small sample sizes in their state-by-state analysis and some of their results could well have been due to sampling error rather than to real differences between states.

Our strategy in this paper, therefore, is to disaggregate the Indian electorate so as to classify states according to the nature of party competition. Broadly speaking (and recognising that there is in practice considerable local complexity) we can distinguish five main groupings, the final one of which we subdivide.

First, we have states such as Delhi, Rajasthan, Madhya Pradesh, Himachal Pradesh and Gujarat, where the 1990s have witnessed a direct contest between the Congress and the BJP. Any third contender – such as the RJP in Gujarat – has proved to be a short-lived phenomenon.

Second, there is another, smaller group of states, namely, Kerala, West Bengal and Tripura, where there has typically been two-party competition, but this time involving Congress against the Left. The entry of the Trinamool Congress in 1998 complicates this picture somewhat in West Bengal, but does not alter the basic Left vs rest nature of electoral contest.

Third, there are a number of states where, in recent elections, the main contenders have been Congress and a regional party. For our purposes a regional party is not defined in ideological terms but simply as a party whose electoral support is confined effectively to one or two states. In this grouping we have placed Andhra Pradesh (where the main regional party is Telugu Desam (Naidu) (TDP(N)); Assam, Asom Gana Parishad (AGP); Goa, United Goan Democratic Party (UGDP) and Maharashtra-wadi Gomantak Party (MGP); Meghalaya, Independent (Ind); Pondicherry, Dravida Munnetra Kazhagam (DMK) and All India Anna Dravida Munnetra Kazhagam (AIADMK); Punjab, Shiromani Akali Dal; and Tamil Nadu DMK and AIADMK among others. The 1998 election saw the BJP mark its presence in many of these states, but basically as an adjunct to its 'regional' ally.

For some purposes it is useful to distinguish another kind of regional contest where the BJP has emerged as a party with substantial presence in its own right. The BJP has entered into alliance with a regional party in each of these, but it is a substantial presence in its own right in these states. In this category we include Haryana alliance with Haryana Vikas Party (HVP) till recently; Maharashtra, alliance with Shiv Sena (SS); Karnataka, alliance with

Lok Shakti (LS); and Orissa, alliance with Biju Janata Dal (BJD).

Finally, we have two states where the 1990s have seen a multi-party competition, reducing the Congress to the status of a minor party. Thus in Bihar the competition is between Congress, the BJP, Samata Party (SAP) and the JD (later the Rashtriya Janata Dal (RJD)) while in Uttar Pradesh there has been a four-way competition involving Congress, the BJP, the BSP and the Samajwadi Party (SP).

That leaves a few states and union territories including Jammu and Kashmir and several small hill states of the north-east. Since there is no reliable survey data on these states, we have excluded these from our classification and subsequent analysis. But in principle all these can be put under one or the other of these categories.

Tables 1 and 2 show the distribution of the vote in these five types of contest in the 1996 and 1998 elections, respectively. As we can see, there were very substantial differences in the patterns of party support in these five broad groupings, and the

patterns were fairly stable over the course of these two elections. There is of course considerable variation within each of the groupings in the actual level of Congress support, no doubt depending on particular state-level factors, and we would not wish to claim that the groupings make all state-level analysis redundant. We shall try to show, nonetheless, that these groupings have considerable explanatory potential.

While there have been considerable changes over time in the nature of party competition in India, it is noteworthy that broadly comparable groupings can be found in earlier periods too. In Table 3 we construct an analogous grouping for 1967. The choice of the 1967 election, as a point of reference is guided by the fact that it is only in 1967 that the non-Congress parties gathered enough support to allow us to carry out any analysis of their social profile. In terms of data availability, 1971 is a better point, for the survey that year was more comprehensive. However, the existence of various pre-poll alliances – the grand alliance of the major opposition parties and the Congress-CPI alliance –

in that election prevents us from obtaining a clear picture of individual party preferences.

II All-India Picture: 1967, 1996 and 1998

Our central concern is to explore where the Congress vote comes from in our five types of party competition. Before proceeding to this disaggregated analysis of the social base of voting, however, it is useful to look at the all-India picture to provide us with a baseline for comparison. Our main sources are the National Election Study (NES) of 1996 and 1998. For comparison, we also go back to the first ever nationwide survey of the Indian electorate carried out by the CSDS in 1967. We should however note that the 1967 survey was a relatively small one and restricted to male electors. Results from 1967 should therefore be treated with caution.

For a first look at the data we restrict ourselves to a simple classificatory scheme, a composite measure of caste and religion which we shall term for short a measure of 'community' (see Appendix 3 for technical details). The measure distinguishes the following six community groupings: (1) Hindu upper castes; (2) Hindu backward castes or the 'OBCs'; (3) scheduled castes or 'dalits'; (4) scheduled tribes or 'adivasis'; (5) Muslims; and (6) other religious groups (non-SC/ST Christians, Sikhs and remainders). We are conscious of the fact that these 'communities' do not represent the primary social cleavages at the ground level. These communities are themselves aggregates of a large number of lived-in social communities. In later analysis we plan to use a finer classification of 'jati' groupings (in particular disaggregating the OBC), but the present classification should be adequate to give us a first cut of the broad picture of the social basis of Congress support.

We begin, in Table 4, with the picture for 1967. Among respondents to the survey, 50 per cent reported that they had voted for Congress. As we can see, the figures for the different community groups are all fairly close to this overall figure of 50 per cent: they range from a low of 45 per cent among Muslims to a high of 57 per cent among dalits. All these figures will be subject to sampling error, and we have in fact had to exclude the figures for adivasis since the base N is a tiny 30 respondents. Some of the differences are in fact statistically significant but the magnitude of the differences is relatively small. The overall picture, therefore, is the conventional one that Congress support did

not vary strongly by community group at the all-India level.

At the all-India level the picture had not changed greatly by 1996. In 1996 31 per cent of our respondents reported that they had voted for Congress. Table 5 shows that the proportions of dalits, Muslims and especially adivasis supporting Congress were higher than the overall average of 31 per cent, while the proportion of OBCs supporting Congress was lower than the overall average. This pattern was again repeated, as Table 6 shows, in the 1998 Lok Sabha election.

It is not, then, quite correct to say that Congress recruits a representative cross-section of the electorate, even at the all-India level. There does seem to be a fairly stable social profile to Congress support, and it is notable that hints of the same profile can be found as far back as 1967. Thus in all three surveys the OBCs were less inclined than other groups to support Congress while the dalits and adivasis were more inclined towards Congress than were other community groups. The only exception are the Muslims, whose pattern of support appears to have been somewhat variable over time. Given the uncertainty

about the 1967 survey, however, we should be extremely cautious about reading too much into this change (and it is perhaps worth noting that the 1971 survey showed the more usual pattern of Muslims supporting Congress).

It is, however, fair to say that, at this all-India level, the magnitude of the group differences in support for Congress is relatively small. A useful measure of the magnitude of the group differences is the odds ratio. We can for example, look at the odds of supporting Congress or some other party among members of a particular community group and compare this with the odds of supporting Congress in the sample as a whole. This will give us a measure of how distinctive a particular group is. For example, in 1998, 47 per cent of adivasis voted Congress while 53 per cent voted some other party – odds of 47:53 or 0.89:1. In 1998, the overall level of support in the survey for Congress was 30 per cent giving odds of 30:70 or 0.43:1. The ratio of these two odds is 2.07:1. A ratio of 1:1 would indicate that the odds of supporting Congress was exactly the same in the group in question as it was overall, while odds larger than 1:1 would

indicate stronger support in the particular group, and odds below 1:1 would indicate lower support. In this way we can use the odds ratio to tell us how distinctive a particular group is in its voting pattern.

Odds ratios have a number of convenient statistical properties, and they are particularly useful for making comparisons over time or between state groupings. Their main advantage is that they in effect take account of changes in the overall level of support for a party and thus enable us to make comparisons between elections or regions when the overall level of support is rather different. Table 7 shows the odds ratios for the 1967, 1996 and 1998 elections.

Table 7 suggests that there was actually slightly greater variation in the odds ratios in the 1990s than there had been in the 1960s. In 1967 all the odds ratios were quite close to 1:1, ranging from 0.90 to 1.20. The range was substantially higher in 1996 and higher still in 1998, ranging from 0.72 for the OBCs to 2.07 for the adivasis. At the all-India level, then, there does seem to have been a clear increase in the extent to which the various community groups differed in their support for Congress. In this sense the social basis of Congress support has become more distinct over time.

We can test formally whether the odds ratios have remained constant over time by using a log-linear model (Appendix 1). We fit to the data a model which postulates that support for Congress varied from election to election, that support for Congress varied from one community group to another, but that this relationship between Congress support and community remained the same in all three elections (see Appendix 1 for details). What we find is that the hypothesis of constant odds ratios has to be rejected ($p < 0.001$). This confirms more rigorously the conclusion we had drawn from Table 7. That is, at the all-India level, the conventional wisdom that Congress received more or less equal support from all community groups alike is less true than it used to be.

A look at voting by class (see Appendix 2 for details) for the 1996 and 1998 elections in Tables 8 and 9, respectively reveals a substantially similar picture. While the BJP vote displays a steep slope in favour of the upper classes and the LF and BSP vote shows an opposite slope, the vote for Congress is evenly spread across all classes in 1996. The pattern for 1998 is a little more erratic, but it also shows that the vote for Congress is not concentrated in some classes. The survey data at our disposal

does not permit a class index for 1967 that can be strictly compared to these two elections. But it may not be off the mark to think that at the national level the support for Congress has continued to be spread across the class divide in the entire post-independence period.

III Differentiation in Congress Era

Now we move on to consider the pattern of social support for Congress in different types of contest in the Congress era by taking up 1967 election as an example. Table 10 shows the relationships between community and vote in the four types of contest that we were able to distinguish in 1967.

Barring a few cells Table 10 does not show any striking difference in the support base of the Congress in different categories. Congress appears to be weak among the upper castes in the contest against the Left

and the Right and stronger among dalits in all the categories. Unfortunately, the small sample size of the 1967 survey at the regional level also renders the picture rather confusing and unreliable. What we need to do here is to conduct some formal statistical tests which tell us whether there were any statistically significant differences in the bases of Congress support in the four types of contest. Table 11 therefore shows the pattern of Congress/non-Congress odds ratios in the four types of contest and indicates which ones are significantly different from the all-India pattern. As we can see, there were some significant results only in the case of the contests between Congress and the Right. In particular, the odds of the upper castes supporting Congress were significantly poorer in these contests (an odds ratio of 0.67:1) than they were in general (0.96:1). Conversely, the odds of dalits supporting Congress were significantly greater in this

type of contest (1.65:1 compared with the overall 1.14:1 for dalits).

There is, then, a clear and understandable pattern here: Congress support was less evenly drawn from the various community groups when it was in competition with the Right than it appeared to be overall. Protest against the one-party dominance of the Congress began among the upper castes who were more inclined to support the Right rather than Congress when the structure of party competition gave them the opportunity. But the appeal of the Right to the upper castes was mirrored by its lack of appeal to the dalits, who consequently were relatively inclined towards Congress as the main alternative to the Right.

In overall terms, the propensity of the various community groups to support Congress in 1967 varied, but only slightly so, according to the nature of party competition, with the presence in some states of a major right-wing alternative to Congress leading to a more distinctive community profile in those particular states. It was only the contest with the Right that showed distinctive patterns of social cleavage in 1967. We must remember that the small sample sizes in other types of contest make it very difficult to find statistically significant results. But on the current evidence we must conclude that in other types of contest there was little variation from the general picture, with most groups showing rather similar levels of support for Congress. A differentiation of the Congress' social profile had begun, but it was nothing compared to the disjunction that we observe in the 1990s.

IV

Disjunction in Post-Congress Era

We can now jump to the 1990s, the post-Congress era. It is post-Congress not in the sense that the Congress ceases to be a major player; indeed the Congress continues to be a major player in all but a few states. It is post-Congress in the sense that the Congress ceases to be the pole around which political competition is structured. We also move on to the larger and hence more robust surveys of 1996 and 1998. These surveys allow us to construct a reliable class index, besides the familiar community groupings. Table 12 shows the relationship between community and class on the one hand and vote on the other in the five types of contest which we have distinguished for the 1990s. We begin with the INC versus BJP contests.

In terms of community as well as class, Congress appears to be a party of the

underdogs when it faces the BJP. In this first type of contest there is a strong relationship between community and support for Congress. As expected, support for Congress was at its strongest among the Muslims, where it reached 85 per cent in 1998. It was also high among dalits and adivasis and then fell to 35 per cent and 32 per cent among the OBCs and upper castes respectively in 1998. The sources of support for the BJP were the mirror image, being strongest in the upper castes where it reached 65 per cent, then falling steadily as we move down to the OBCs and dalits, followed by a sharp break between Hindus and Muslims. In both the elections the Congress is favoured more by the groups lower down in social hierarchy. The steep slope of the class profile for 1996 brings out the relationship most sharply. The poorer the voter, the greater the chances of their voting for the Congress and vice versa for the BJP. Unlike in the case of community, the class profile for 1998 is more diffused for the Congress. In overall terms the BJP represents social and economic privileges and the Congress its reverse when these two parties face each other.

This pattern is not specific to these two elections associated with the decline of the Congress. The same was replicated in the 1998 assembly elections for Rajasthan, Madhya Pradesh and Delhi, where the Congress scored spectacular victory. We have the advantage of very large size exit polls conducted by the CSDS and its

associates for these assembly elections. These exit poll data provide perhaps the most authoritative source of voting patterns in the 'Hindi heartland' and confirm that support for Congress shows a clear social profile in this group of states. Despite its overall victory the Congress trailed behind the BJP among the upper caste Hindus and managed to split evenly the OBC votes. It was its decisive lead among the dalits and Muslims, and to a lesser extent among the adivasis, that gave Congress the decisive edge.

We next move on to the second of our five types of party competition, namely the contests where the principal contenders were Congress and the Left front. The results are shown in Table 13.

The picture is reversed in this case. The same Congress that is the natural party of the underprivileged when it confronts the BJP turns out to be a party of the socially and economically privileged in its contest with the communist parties in Kerala, West

Bengal and Tripura. Table 13 shows that both in 1996 and in 1998 the vote for the Left goes up as one goes down the Hindu ritual hierarchy, from the upper castes to the OBCs to dalits. The strongest support for the Left comes from among dalit voters, reaching 62 per cent in both years. The OBCs also showed above-average support for the Left in both years. We can also see in Table 13 how the LF has eaten sharply into Congress support among Muslims. In this type of contest the Muslims divided their vote more or less evenly between Congress and the LF, whereas as we saw earlier, in states where the BJP had been the main opposition, Congress had taken the lion's share of the Muslim vote. Perhaps in consequence, Congress' profile changes dramatically from the one that we saw in the first group of states. The picture gets somewhat muddled in 1998 largely due to the rise of the Trinamool Congress at the expense of the Congress in West Bengal.

But the class profile remained fairly sharp in both the elections. Table 13 shows that the percentage of poorest who voted for the Congress was almost half of the rich who did so. The vote share of non-left parties among the poor and the poorest was lower than their own average. The vote for the Left did indeed have the kind of class profile the communist parties would like to have: the poorer the voters the greater the vote for the Left. In its contest with the LF, the Congress tended to receive the support of those groups that had voted for the BJP in the first type of contest.

Unlike the first two groupings, the contest of the Congress with regional parties does not reveal a very clear social or economic profile. Various community groups show relatively little variation in their support in the contest between the regional and the national parties. We need to be rather careful here since the various regional parties that we have grouped together here are a rather heterogeneous set and have their own distinctive identities. In this group we have classical regional parties (those with a regional support base and regional ideology) mainly from the south and peripheries. However, there are some distinctive patterns. Table 14 shows that in both the elections the regional parties tended to do better among OBCs and 'others' (mainly Sikhs) than other communities. In 1996 dalits gave more support to the regional parties than did the upper castes. However, this pattern was not replicated in 1998. The class profile also showed a fairly even spread of party support, except a tendency of the regional

parties to be a bit middle heavy. On balance, the Congress seems to mirror the catch-all character of the regional parties in this set. It is useful to contrast this with the social profile of the BJP within this set. It received more support from the upper castes and very little from the Muslims, higher support from the upper classes and lower from the poor. So, unlike Congress, BJP support shows the same character irrespective of the nature of the contest in which it is engaged.

The above generalisation about the regional parties is however not true when the regional parties in question are from the states where the BJP leads the coalition. Here the BJP-regional alliance had a profile similar to that of the BJP. If anything the regional allies like the Shiv Sena tended to be more upper caste dependent than the BJP in both the elections. The Congress had its strength among the Muslims and dalits. The 1998 election saw the Congress improve its share among these two communities, but not among the OBCs. In class terms too there was a neat relationship between voting Congress and being less well-off, though the slope was less steep than in the case of direct Congress-BJP contest. The class pattern of voting for the BJP and its regional ally was not very clear or robust in this instance.

Finally we turn to Bihar and Uttar Pradesh where the Congress faced multi-cornered competition from parties that sought to walk away with different slices of the Congress rainbow. In Bihar the BJP and Samata Party ate into Congress support among the upper castes, while the JD ate into Congress support among the OBCs and Muslims, and, to a lesser extent, among the dalits as well. In economic terms, the Samata-BJP alliance took the upper class

vote while the JD showed a clear lower class support, much like the Left in the second group of states, leaving the Congress with the remainder in all the classes.

In the four-way contest in Uttar Pradesh, some of the main players were different but the effect was much the same. The SP played a similar role in Uttar Pradesh as the JD in Bihar – it was also very strong among the Muslims and OBCs – except that it had no support among dalits and was not as strong among the poorest. Here the presence of a dalit formation, the BSP, accounted for a huge slice of the dalit vote. And this meant that BJP support was even more heavily concentrated in the upper caste than it is in the other types of contest.

As a result, with distinctive parties capturing upper caste, OBC, dalit and Muslim votes in Uttar Pradesh, there remained no major group supporting Congress. In community terms UP in the 1990s shows a more developed form of cleavage politics than any other Indian state. The same gets reflected in class terms to the extent to which these communities have a distinct class profile. The BJP was strongly rooted among the upper classes and the BSP among the poor. The SP tended to draw more votes from the lower classes but was not confined to them, since the class profile of the OBCs and Muslims is more diversified than that of the upper castes and dalits.

The 1998 election witnessed a swing towards the BJP and its allies in both these states. However the social basis of voting in 1998 remained remarkably similar to that of 1996. The RJD inherited the JD legacy in Bihar, despite losing some of the OBC and a significant part of its dalit votes to the parent party. Squeezed from both the ends, the Congress lost its strength among dalit and Muslim voters, notwithstanding its alliance with the RJD. The alliance did give the Congress a lower class profile similar to the RJD, though the latter had lost its steep class profile due to the departure of some of the dalit and lower OBC voters. The BJP-Samata alliance retained its upper caste vote but expanded its vote base among other communities and in this process also broad-based its class appeal.

The picture of community patterns in voting shows no real difference in 1998 in Uttar Pradesh. The BJP, the SP and the BSP continued to maintain their hold over the upper castes, Muslims and dalits respectively, though the BJP gained some dalit votes. In class terms, there was greater polarisation, perhaps due to class voting within each of the communities. The BJP

was more intensely upper class and the BSP more lower class than before. The Congress ended up with something of an upper class slant in its support base.

V

From Catch-All to Catch-None

We can summarise the results of Tables 12 to 17 by looking at the pattern of the odds ratios. In order to simplify, we restrict ourselves to an examination of the Congress/non-Congress odds ratios. That is, we consider the odds of voting either for Congress on the one hand or for some other party on the other. These odds ratios are shown in tables 18 and 19. The first column of these tables shows the all-India odds ratios, and the other columns show the odds ratios in the different types of contest. The figure for the first column in Table 18 and 19 are the same as reported earlier in Table 7 to show that at the all-India level the Congress enjoys a catch-all profile. If the figures of the subsequent columns deviate substantially from those reported in the first, it will support the contention that Congress is not a catch-all party in the regions defined by the various types of contest.

As we can see, these summary tables show a considerable deviation from the all-India ratios. Take, for example, community patterns in 1996. Among the upper castes, the all-India ratio was 0.96:1. Since this odds ratio is close to 1:1, it indicates that in all-India as a whole the upper castes were not distinctive in their support for Congress, being very close to the average for all community groups. However, moving across the top row of Table 17, we can see some rather large deviations from this ratio of 0.96:1, the ratio falling well below 1:1 in the contests with the BJP and rising well above 1:1 in the contests with the LF. There is relatively little variation among the OBCs, but in the third row of the table we see that the dalits varied substantially in their odds of supporting Congress from one type of contest to another. The overall figure of 1.21:1 suggests that the dalits were not especially distinctive when considered at the all-India level, but we can see that the odds ratio was considerably higher than this in contests with the BJP (or the BJP regionals) but considerably lower in the contests with the LF. A similar pattern obtains with the Muslims.

In short, the type of contest makes a major difference to the support which the various community groups give Congress. We can test this claim formally with a log-linear model. The hypothesis that the odds ratios are the same in the different types

of contests has to be rejected ($\chi^2 = 174.4$ on 25 degrees of freedom, $p < 0.001$).

The same reasoning can be extended to all the tables to discern an overall pattern. The evidence from both the community and the class patterns of voting in the 1996 and the 1998 elections shows that the

Congress is not a catch-all party at levels lower than the all-India aggregates. The only exception to this occurs when the Congress faces the classical regional parties (regional both in outlook and support base) that are themselves catch-all in character. In all other types of contest, the odds of

voting for the Congress are substantially lower than average among some sections that have been effectively targeted by its main rival. Thus in contest with the BJP or the BJP-led regional alliance, the Congress gets less support from the upper class and upper castes and depends excessively on the poor, Muslims, dalits and adivasis. On the other hand, when it confronts the Left the odds of the poor and dalits voting for the Congress fall substantially below those of the upper castes and the well-to-do. In those states where the Congress faces multi-cornered competition the odds ratios are deceptively even in their spread. But this is better interpreted as a 'catch-none' situation, for in appealing equally to everyone the Congress appeals to no one in particular and gets edged out of the electoral race in states like UP. Alternatively, as in Bihar, it simply reflects the social profile of its dominant electoral ally.

VI Whither Congress?

The empirical findings of this paper are easily summarised: Congress support changes from one type of contest to another. While the all-India figures show relatively little variation in support from one community group to another, we find much bigger variations once we disaggregate. Moreover, the pattern varies from one type of contest to another, but the differences tend to cancel out at the all-India level. Thus, in competition with the BJP including its regional allies, the Congress comes out as a party of the socially and the economically marginalised. The same party is supported by the socially and economically privileged when it competes with the Left. While it retains a catch-all character in some states where it faces all-regional parties, it declines into a catch-none formation when it is pushed from more than one direction by various cleavage based parties. Parties with specific sectional appeal, such as the BJP, BSP, LF and JD (later the RJD) all have distinctive social bases of their own, whereas Congress does not seem to have any particular core that is common to its diverse social profile across various types of competition that it faces in different regions.

The more difficult task is to draw conclusions from these findings about the future of the party in the context of its current decline. Clearly the general debate about the strength and the drawbacks of a catch-all party in competition with cleavage based rivals is only partially relevant here. We have seen that the Congress is a catch-all formation only in

a deceptive, aggregate sense. At the level where the effective political choice is made, the Congress is often cleavage based like some of its rivals. It is true that the Indian electoral system has built-in incentives for a party like the Congress that goes for cross-sectional mobilisation. Sectional

interest based parties are at a structural disadvantage in this system. The cross-cutting of cleavages that characterise Congress gives it the flexibility to pick up support from a diversity of community groups in various types of contest. It enjoys a much higher 'bounce back' capacity,

should its opponents fail in office. Not being tied closely, and therefore not being limited, to the interests of any one distinctive group at the national level has mobilisational advantages.

Some of these advantages are neutralised, however, by the emergence of the state as the effective arena of electoral choice in the last decade. In localised and multi-cornered competition, community based mobilisation often becomes the most effective strategy for vote gathering. Such a context leaves a party like the Congress vulnerable to community-based rivals like the SP and the BSP who can create a niche for themselves at its expense. The catchment area of these parties is much smaller than the Congress, yet they can be surer of the loyalty of their voters. This is indeed how the Congress was marginalised in the states of UP and Bihar. Besides, the fruits of cross-sectional mobilisation can be picked only by those who happen to be situated above the threshold of electoral viability. A party that exists below the threshold of viability – as the Congress does in UP, Bihar, Tamil Nadu and West Bengal (and, now, also Maharashtra?) – cannot afford to be everyone's friend. It faces gradual erosion unless it can cultivate its own loyal social groups.

Finally, whether a diverse social profile is a source of strength or a handicap depends in large measure on the process by which the profile was acquired. The Congress did have a different social profile in different states in the Congress era as well, but that was acquired and cultivated through active political mobilisation. Other parties picked up those votes that the Congress failed to reach or retain. The situation today is different. If the social profile of the Congress voter varies according to the nature of political competition it faces, it is not because Congress has adopted different tactics vis-a-vis different political opponents. The simple reason for this phenomenon is that for over a decade now the initiative in sectional mobilisation has been with the non-Congress parties. The old 'opposition' parties have activated social cleavages in the arena of mobilisational and then electoral politics, the Congress has retained those who were not actively mobilised by others. There is thus a residual quality to the social profile of the Congress; its profile is no more than the obverse of the profile of its main opponent. To put it less kindly, its shape is like that of a pillow: it reflects the shape of the person who last sat on it. Nowonder the Congress enjoys greatest support among the adivasis, the only 'community' in our six-fold classifica-

tion that is still not quite politicised. Dalits vote for Congress but not in those settings where either the BSP or to some extent the Left offers a viable political alternative.

When an ageing catch-all party faces challenge from cleavage based political formations, it can respond in multiple ways. First of all, it can simply wait for the high threshold of viability in the first-past-the-post system to take its toll and nip the

emerging challenge in the bud. This can be accompanied or followed by various measures of accommodation and absorption of the challenge. If the challenge crosses that stage, the next option is to isolate the section and pit it against a broader social alliance, thus proving the futility of sectional mobilisation. Or it can try to diffuse the social cleavage by subsuming it in an issue cleavage. The dilemma of the Congress in the 1990s is that it faces

Thirteenth International Conference on Input-Output Techniques August 21-25, 2000, Macerata, Italy

CALL FOR PAPERS

The International Input-Output Association and the University of Macerata announce that the Thirteenth International Conference on Input-Output Techniques will be held in August 21-25, 2000 in Macerata, Italy. Macerata is about 40 km from the port of Ancona, which lies on Italy's Adriatic coast.

Goal of the conference

The goal of the conference is to promote the exchange of ideas among input-output specialists worldwide. The conference is likely to feature work on social, national, and regional accounting and modelling; industrial structural change; industry's relationship to energy use and the natural environment; the ways in which innovation effects productivity change; and new methods in interindustry analysis. Other theoretical and applied work with input-output tables is also welcome.

Deadline for abstracts

Please submit abstracts for papers by October 31, 1999 to the Head of the Scientific Programme Committee.

Special sessions

Those wishing to organize a parallel session on a specific topic should send the complete session by October 31, 1999 to the Head of the Scientific Programme Committee.

Leontief Memorial Prize

The IIOA is also pleased to announce a Leontief Memorial Prize for the best conference paper of young authors (born after 1959, unpublished work, work combining theory and application). The Leontief Memorial Prize Committee will select the winning paper, which will also be published in Economic Systems Research. Authors who would like to compete for the Leontief Memorial Prize should submit their paper to the Head of the Scientific Programme Committee by January 31, 2000.

e-mail: Lahr@rci.rutgers.edu

section-based challenge that can no longer be contained by these two elementary devices. Various competitors are running away with slices of the rainbow social coalition that characterised the Congress. The historical experience of catch-all parties suggests that, since they have no distinctive group appeal, they are particularly dependent upon their image, issues and perceived record of governance. Congress finds today that in widespread public perception it is short on all of these. It faces a challenge of recharging the ideological battery, re-invigorating the organisation and re-inventing the rainbow social coalition. It is not clear if today's Congress has within it the resources to accomplish this historical task that was last carried out by Indira Gandhi nearly three decades ago. It is not clear if this task can be accomplished without splitting the party into smaller and more vigorous offshoots, a process that we have seen in the last few years, a process that can open up possibilities of fundamental reconfiguration of the political space.

APPENDIX 1: ODDS RATIOS FOR COMMUNITIES

We used the statistical package SPSS to fit the log-linear models. To test whether the odds ratios had remained constant over time, we used the following SPSS instructions:

```
LOGLINEAR INC (0,1) BY COMM
(1,6) SURVEY (1,3)
/PRINT=DEFAULT ESTIM
/DESIGN=INC, INC BY COMM, INC
BY SURVEY
```

where INC is a binary variable measuring Congress vote (coded 1 if the respondent voted for Congress, 0 if the respondent voted for some other party, non-voters being excluded); COMM represents the community variable described above in the text, and SURVEY represents the three election surveys (1967 coded 1, 1996 coded 2 and 1998 coded 3).

To test whether the odds ratios were the same in the different types of contest, we

used the following SPSS instructions:

```
SELECT IF (SURVEY EQ 2)
LOGLINEAR INC (0,1) BY COMM
(1,6) ZONE (1,6)
/PRINT=DEFAULT ESTIM
/DESIGN=INC, INC BY COMM, INC
BY ZONE
```

where ZONE represents the aggregation of states into the different types of contest as described in the text. In order to be consistent with the tables, we have distinguished Bihar from UP, thus giving six rather than five categories for this variable. Note that SPSS prints out the adjusted standardised residuals from this model. These residuals in effect indicate where the model gives a poor fit. Where the residuals are greater than 2.57 we can say that the deviations from the model are significant at the 0.01 level. However, it must be remembered that some significant residuals will be expected by chance alone.

APPENDIX 2: CLASS INDEX

The class index is more a measure of occupation/wealth than class itself. The index was constructed using land ownership, occupation, and house type/monthly income as a residual measure. Those in the top or 'rich' category are people who either have Class-I occupations, such as lawyers, doctors and architects, etc., or are large scale businessmen, or are farmers with more than 20 acres of land. As a top-up category, people who earn more than Rs 20,000 per month are included. The 'upper middle' category contains respondents with Class II and III occupations, such as nurses and secondary school teachers and shop assistants, police and army soldiers, or skilled workers, such as electricians, or small-scale businessmen, or farmers with between 10 and 20 acres of land. As a top-up, people who live in pucca accommodation are included. The 'middle' category is Class IV employees, craftsmen and artisans (Group I), semi-skilled workers and petty businessmen and farmers with less 10 acres of land, and

people who live in pucca-kutchha accommodation. The 'poor' are craftsmen and artisans (Group II), unskilled workers, domestic servants, poultry and dairy farmers, fisherman, and landowning agricultural labourers and sharecroppers, etc., and people who live in kutchha accommodation. The 'poorest' class is for landless agricultural labourers, shepherds and sharecroppers, etc., and people who live in a hut. For the unemployed, students and housewives, the index is calculated with reference to their father's/husband's class.

APPENDIX 3: COMMUNITY CLASSIFICATION

Respondents were asked to name their religion and whether they were SC, ST, OBC or other. The steps of classification followed a sequential selection process. Firstly, if the respondent's religion was Hindu and their caste group was other, they were coded as upper castes. Then, if their religion was Hindu and their caste group was OBC, they were coded as OBCs. Then, irrespective of their religion, if their caste group was SC or ST they were coded as SC or ST, respectively. Of the remainder, if their religion was Muslim they were coded as Muslim. Finally, if their religion was other than Hindu or Muslim, they were coded as 'other'. Each step overrides the steps that came after it. Thus a scheduled tribe Christian is coded as being ST rather than other religion. The actual distribution of the sample in each of the surveys by these categories is as seen in Table A:

[The basic argument of the paper was first presented in a workshop of Lokniti network of the CSDS on survey research methods in December 1997. We would like to thank all the participants of the workshop, especially Dhruv Sheth, for thoughtful comments on the implications of the data and its sponsor, the Indian Council of Social Science Research. The Higher Education Links Programme of the British Council allowed Anthony Heath to spend a few days at the CSDS to work on this paper. Both the authors would like to express their gratitude to Oliver Heath and CSDS data unit for research support.]

With the Spice Trade, the sky was the limit.
With Nedumbassery, it's just the launching pad.

Once, the spice trade revolutionised the peninsular economy.

And now, the Cochin International Airport at Nedumbassery - the most modern and well-equipped airport in India - is all set to boost the exports and the tourism industry, and take the region to new heights of prosperity.

Hudco's prompt assistance of Rs 143 crores, towards the project's first-phase cost of Rs 204 crores, reinforces its commitment towards building assets for the nation.

Beyond financing such infrastructure projects crucial to development, Hudco also evaluates their design, planning and engineering soundness, and their economic viability.

Hudco also assists in designing and building homes, by promoting cost-effective and innovative technologies.

Hudco's role is large, and expanding. Today,

it contributes to capacity building by forging partnerships between public and private bodies - from municipal corporations to NGOs - to enhance the quality of life in towns and cities.

And the Hudco Niwas Individual Housing Loan Scheme is an endeavour to ensure homes for the common man.

Hudco's expertise and activities are changing the face of more than 1700 towns and thousands of villages.* Efforts that are ensuring that development and infrastructures reach the very grass-roots, and help build a stronger foundation for the future.

**Hudco has funded over Rs 23,241 crores for projects worth over Rs 38,756 crores, towards: 86 lac homes, 49 lac sanitation units, 5.2 lac residential plots, 626 building centres and 719 urban infrastructure projects costing Rs 13,988 crores of which Hudco's contribution is Rs 7,552 crores.*

The foundation for a stronger India.

equip students for teaching and research careers in management. The Fellow Programme students can select their specialisation from the following areas.

AREAS: ☐ Corporate Strategy & Policy ☐ Economics & Social sciences
☐ Finance & Control ☐ Marketing ☐ Organisation Behaviour, Personnel Management & Industrial Relations ☐ Production & Operations Management ☐ Quantitative Methods, Information Systems & Computers. ☐ Energy & Power ☐ Transportation.

ELIGIBILITY: Applicants should have 1. A Master's Degree in any discipline or equivalent qualification, recognised by the Association of Indian Universities, with a minimum of 55 percent marks. Those appearing for the respective examinations can also apply provided they complete their examinations and all other requirements for the degree before June 30, 2000,

OR

First class Bachelor's Degree in Engineering or Technology with two years work experience.

2. Apart from the above, FPM applicants must also satisfy the eligibility criteria for the Common Admission Test (Details given in the CAT Advertisement).

3. NRIs and Foreign candidates who have taken the GMAT (during 1999) are also eligible to apply.

FINANCIAL SUPPORT: FPM students in good standing are given a fellowship for four years to cover tuition and other fees, and room rent and computer facilities. In addition, they are given a stipend of Rs.36,000 per year to cover boarding and other expenses, and also a contingency grant of Rs.10,000 per year. This is likely to be revised.

No financial support is given to NRI's and foreign candidates.

Two Infosys Fellowships of Rs.9 Lakhs each for the total duration of 4 years are available for candidates wishing to pursue research related to the information technology industry. Amongst the applicants, 2 outstanding candidates will be selected for the award of these fellowships.

HOW TO APPLY : Step 1. Take Common Admission Test (CAT) on 12th December 99. (For details please see CAT advertisement which will appear in all leading newspapers during 21st, 22nd & 23rd August 99). Step 2. Obtain admission forms free of cost from **FPM Office, Indian Institute of Management Bangalore, Bannerghatta Road, Bangalore - 560 076. FPM application forms will be issued from 1st September 1999.**

Requests for forms must be accompanied by a self-addressed envelope (size 9" x 12") affixed with stamps worth Rs.26/- and a self-addressed slip.

LAST DATES : 1) To receive requests for application forms : **October 29, 1999**

2) To receive completed application forms : **November 26, 1999**

Economic Reforms for the Next Decade

As we near the end of this decade and century, it is opportune to look back, review the developments that have occurred in the Indian and the world economies and examine what lessons we can learn from our experience with reforms in the context of world developments. In the light of these lessons we can determine the kind and pace of reforms that should be pursued in the coming decade. **2582**

Citizenship, State and Civil Society

A great deal of the recent enthusiasm for civil society in this country has been, unfortunately, driven by a negative, if not a hostile, attitude towards the state and, indeed, towards all public institutions. Nothing can be more destructive of civil society than the idea that the best way to create and invigorate civil society is to empower the people at the expense of the state. And just as state and civil society are complementary, so are state and citizen. Furthermore, civil society cannot amount to very much where citizenship is absent or weakly developed. **2588**

Employment Policy

The growth performance of the Indian economy, while decent by the standards of developing countries, has failed to improve employment conditions in the country even though the rate of labour force growth has been quite low so far. The rate of labour force growth is currently accelerating and is expected to remain high for quite some time to come. So, if past patterns continue, the country is likely to be soon confronted with an employment crisis. Analysis of the past experience in an effort to identify the problems that must be addressed and to propose ideas for future policy. **2592**

Dalit Assertion

Data on the voting behaviour of dalits point to the conclusion that while the political institutions of Indian democracy enjoy the dalits' support, the political actors stand more or less discredited. This is an alarming signal for political parties: they cannot take the support of the dalits for granted and will need to show genuine concern for issues affecting the dalits. **2609**

Education, political representation and development schemes have helped the younger generation of scheduled castes in Haryana to enter modern occupations, but landlessness among rural SCs and violation of human rights of SCs all over the state continue. **2548**

Capital Market Reform

In India it was not the capital market regulator or the government which drove the change toward automated trading systems and modernisation of stock exchanges. The National Stock Exchange, through example, has forced a relentless pace of change in the markets. The question now is, what next? **2541**

TDP's Politics

What does the regional politics of the Telugu Desam Party of Chandrababu Naidu mean to the people of the state? A critical essay, in the context of the current elections, on the emergence of Telugu Desam, the changing leadership of the party and its programmes. **2544**

Beyond Growth and Globalisation

In retrospect, the 'sustainable development compromise' co-opted important social and environmental agendas into a mainstream that was subsequently too easily overwhelmed when it converged with the tributaries of market liberalisation and globalisation. It is time therefore to reassess and join forces in a new critique of growth and now globalisation as well. **2570**

Calcutta Diary

Forget Kargil, forget even Jammu and Baramula. The menace of militancy so described is casting a shadow over the entire north-east, Assam not excluded. Assigning the credit for the disturbed state of affairs to over-activism on the part of Pakistan's ISI is laziness par excellence: the real danger lies in the possibility that we might actually come to half-believe some of the fictions we make up. **2540**

Uneasy Border

Sadly, after more than 25 years of the birth of Bangladesh, almost all the outstanding issues between India and Bangladesh continue to be related to the common border. A successful negotiation of the immigration question is linked to the larger issues of enhanced sub-regional communication and trade. **2549**

High Praise and Neglect

ALONG with truth, the other casualties of wars are also well-kept secrets. Just as we do not know when exactly the Pakistani intruders occupied the outposts in Kargil, or whether all of them have been thrown out by the Indian army, or what were the diplomatic deals that might have been struck under Clinton's mediation, we are kept in the dark about the number of casualties in the Kargil war. While the final toll according to official sources is around 400 Indian soldiers killed and 600 injured, unofficial quarters suspect that the figures could be higher. Many are missing. Families of jawans coming from backward areas have no means to approach the authorities, or make their voices heard over the national media. No one knows about their missing sons.

One could of course argue that the number of casualties in the two-month war in Kargil was less than those incurred in the previous conflicts. The 1962 war with China cost 3,250 lives and left 550 injured. The 1971 war with Pakistan ended with 3,800 dead and 10,000 injured. During the 1987-88 operations by the Indian Peace Keeping Force (IPKF) in Sri Lanka, about 1,150 soldiers were killed and 3,000 injured. While the dead are gone, does any one care to remember the fate of their families, or of those who survived the wars but remained cripples for ever?

After living in obscurity for years, ex-servicemen are suddenly finding themselves in the spotlight, thanks to Kargil. Some newspapers are sending their reporters to interview old soldiers who fought in the 1962, 1965 and 1971 wars, and the families of those killed, to find out how they are eking out a living. The outcome of the interviews is shocking. A large number of families of the deceased in the 1971 war are yet to be given relief, and they are still chasing their dues. Individual cases reveal not only the short public memory, but also the utter callousness, and sometimes vindictiveness, of the administration. An 80-year old army veteran living in Bhubaneswar in Orissa, who first fought in the 1948 war with Pakistan, and then the 1962 war against China, is still awaiting the pension that was promised to him by the army authorities. A newspaper report from Ahmedabad narrates the plight of soldiers who were injured while fighting the 1971 war, and who are now supporting their families by washing dishes in tea stalls, or selling cigarettes in kiosks. The paltry pension that they receive (varying from Rs 150 to Rs 250 a month) can never be enough. The land that was promised to many of them either did not reach them, or even when it did, turned out to be saline and useless. A village in Pune in Maharashtra where every family has given a soldier to the army

remains forgotten by the government which is not even willing to help the villagers set up a higher secondary school there. But the cake is taken by the army authorities of Pune cantonment, who are threatening to evict two disabled soldiers who run 'paan' kiosks in the cantonment which were allotted to them after they were injured in the 1965 war.

The refrain among all these ex-servicemen, or families of the dead soldiers, is the same everywhere — "the government glorifies us during times of war, but forgets us during times of peace". These veterans who have been through it all, are hardly moved today by the eulogies and promises that are being showered upon a new generation of soldiers who are sacrificing their lives in Kargil. Once imbued by the patriotic belief of protecting the nation, the old generation of soldiers who had been let down by the Indian state are today a cynical lot who feel that they had been used as cannon fodder. Are we creating a new generation of cynics among our soldiers, who are being glorified today but will be forgotten tomorrow?

In such a situation, it is necessary to listen to the voices of those who have been directly affected by the war — the jawans and their families involved in wars of the past and the present. The national leaders should have the humility to listen to the words of the mother of one of the soldiers who died in Kargil. Kanakammal, mother of Lt-Col R Viswanathan, said in a recent interview: "People tell me that I should console myself in the thought of my son's martyrdom for the motherland. My mind does not reassure me... I would have thought so if it was an enemy country. In fact, those who should be loving each other are slaying each other" (*Indian Express*, June 9, 1999).

Mumbai

A READER

Controlling Pollution

THE filing of a writ petition in the high court by the president of the Smoke Affected Residents' Forum and cardiologist Sandip Rane should be taken as a happy development bringing to light the obnoxious reality about the health of citizens in Mumbai. Being conscious citizens of this country it is our duty to raise our voice against the fast intolerable level of contamination of our atmosphere and water system. We must not forget that vehicles which have been a nagging source of atmospheric pollution and cause various pulmonary diseases are rapidly growing in number and the concerned officials behave with nonchalance. On the one hand, the level of pollution is so intolerable in some places that parents have started stopping their children from playing in the open. On the other hand, our ministers never fail to rejoice about development projects like overbridges with no thought for the consequent increase in the number of vehicles and malign environmentalists as eco-terrorists.

In so many places in Mumbai, like Kurla and Reay Road, people burn hazardous material knowing and caring little about the effect on the biosphere and officials remain inactive. Accountability should be the hallmark of a democratic system. The people must know and demand compensation if their health is affected. Polluters must be made to realise that their wrong acts would not go unpunished.

There is also the problem of checking toxic material being injected into our territory by first world countries. The material is regarded as very hazardous in the originating countries and people there do not allow it to be dumped there. So it is being sent to our country in the name of recycling.

The Patriotism Stakes

PATRIOTISM, far from being the last resort, has risen to be the first for not only scoundrels, but all and sundry in the wake of the Kargil war. With the election process under way, politicians of course are the first to flaunt it, each competing with the other to prove how much they love the nation. While the BJP and its allies in the ruling coalition are claiming that they saved the motherland from Pakistan, their opponents led by the Congress are blaming them for not being patriotic enough since they were caught napping by the Pakistani intruders.

In this race for establishing their credentials as patriots, political parties of all hues are sliding into a militarist pathology, everyone demanding more expenditure on defence, increased purchases of armaments, escalation of the armed confrontation with Pakistan on the border and further expansion of the nuclear arms programme. It is interesting to observe that even the Left has joined the race. The CPI(M) in West Bengal has nominated an ex-army chief, Shankar Ray Chowdhury, a dyed-in-the-wool hawk, as its candidate to the Rajya Sabha. Not satisfied with this, in order to prove its patriotic bona fides the Left Front government swooped down upon anti-war rallies in Calcutta – a step which even the BJP-led government at the centre has not dared to take (in Delhi for instance, various organisations had held meetings and taken out demonstrations demanding an end to the war in Kargil, without being harassed at any stage). In Calcutta, the rallies were first attacked by the goons of the Hindu communal organisations. Instead of arresting the guilty, the police arrested some members of the rallies on the charge of sedition – under a section in the IPC which the British used to suppress nationalist opinion. It is ironical that the CPI(M) leaders who are running the government in West Bengal today had protested against what they considered an unjust war waged by India with China in 1962 and had gone to jail for their convictions. In those days anti-war opinion lacked any organisational base, and in that frenzy of patriotism any plan to hold peace rallies was unthinkable. But today, the forces in favour of peace between India and Pakistan, if not in a majority, are an articulate minority, as meetings, processions and letters in newspapers indicate. One would have expected the Left to join these voices of sanity, instead of lending their muscles to the jingoist offensive.

What is even more distressing is the news of police harassment of Muslims in the districts of West Bengal bordering

Bangladesh. A bomb blast in New Jalpaiguri in June this year, followed by the discovery of RDX and arrests of ISI suspects in other parts of the state, have set off alarm bells in the Left Front government which claims to have information that ISI agents have started operating in the state. While the threat from the ISI may be real, the law-enforcing agencies of West Bengal are acting in a communal manner. According to Muslim community leaders in Murshidabad, Nadia, Malda, North and South Dinajpur and Jalpaiguri districts, who have complained to the state government, a large number of innocent Muslims have been arrested on suspicion of being ISI agents. The general secretary of the Muslim Progressive Forum, Md Ashfaq, commenting on the developments said recently, "it is well known that Muslims of West Bengal, as loyal citizens of India, have no sympathy or soft corner for subversive elements", adding that the government should ensure that under no circumstances were innocent Muslims harassed. While such developments may well endanger the secular credentials of West Bengal, the Left Front seems more concerned to establish its patriotic credentials.

The opponents of the BJP, it is clear, are too opportunistic politically to go the whole hog in condemning the BJP for its jingoism. While during the election campaign they may criticise the Vajpayee government for its failure to check the intrusions in Kargil, they will hesitate to oppose the sabre-rattling and hawkish positions the government is taking on the resumption of India-Pakistan talks for fear of being dubbed less patriotic than the BJP. Willy-nilly therefore they will be stampeded into joining the chorus in support of a tough line towards Pakistan and enhanced spending on defence and security, with the spotlight on a preposterous 'credible nuclear deterrent' with ground, air and sea launching capabilities, as proposed by the National Security Advisory Board in its so-called nuclear doctrine document. None of them will dare to place before the electorate the dangerous political implications of such strident patriotism and the long-term adverse effects it will have on the country's economy – not to speak of the setback it will cause to the efforts, none-too-purposeful as it is, to build friendlier relations among the nations of the south Asian subcontinent and work out more sensible patterns of economic interaction among them to the mutual benefit of all the countries concerned.

Set for Change

WHILE Bellary may be the current focus of public attention, it may well be that it is the state as a whole which may capture media focus at the close of the hustings. For, unpredictable as voting behaviour may have been rendered in Bellary with the entry of Sonia Gandhi and Sushma Swaraj, the Karnataka electorate has been presented with difficult choices everywhere. All things being equal then, courtesy the Election Commission, Karnataka may just present a model of what the process of democratic choice is all about.

Several developments have been well documented: the abysmal performance of the Janata Dal in government, the rapidly dissipating support base of the Congress, the steady rise of the BJP, the political acumen of the Ramakrishna Hegde-led Lok Shakti and the severe stresses and strains within all the state party units, including the BJP. Equally, the state's fall from one on the threshold of sustained development to one which has been hijacked by cosmetic liberalisation to achieve a superficial modernisation with little real development of productive forces is evident. Thus not only has the state's record in the social sector registered the status quo at best with a decline in some areas, but its economy is in a shambles. In short, all sections of the electorate – those benefiting from the state's welfarism, the middle classes with primary concern for the quality of the services and for new educational and employment opportunities, and the richer sections, landowners and entrepreneurs, the principal beneficiaries of the new economic policies – are being forced in this election to make choices with greater pragmatic consideration and perhaps with tradition and brand loyalties making less of a contribution. Castewise too, in their choice of candidates, all the three national parties, the Janata Dal, the BJP and the Congress, have opted for more or less balanced representation for vokkaligas and lingayats, the two major power-brokers in the state, with small swings one way or the other. The Congress, which has depended on and virtually taken for granted the support of OBCs, dalits and STs, has lost out to the Janata Dal and, in recent years, the BJP because of its insensitivity to their political aspirations. This has meant that the last two elections witnessed swings in the vote shares of the three parties, however with a consolidation of

the votes for the three major parties, indicative of the electorate's desire to vote such that there is greater chance of stable formations.

It is in its understanding of this dimension of electoral politics that the BJP-led National Democratic Alliance (NDA) has gained an advantage. Region wise, southern Karnataka returned BJP candidates in the last election. In northern Karnataka, the BJP has assiduously cultivated OBCs and minorities disenchanted with both the Janata Dal and the Congress. Backward classes in the state comprise some 35 to 40 per cent of the population and have had poor political representation. Other than by the Janata Dal in its early phase, the OBCs have not been mobilised as a single entity, unlike in some other states, although the Congress has tended to treat large sections of them as its vote bank. In Bellary, for instance, a complacent Congress has not fielded a single kuruba (a scheduled tribe which comprises a significant proportion of the 1.1 million voters) in the assembly segments, whereas the NDA has two kurubas nominated from the region. In northern Karnataka, together with the Lok Shakti the BJP aims to consolidate the lingayat vote which has been distributed equally among the three parties. At another level, it has not hesitated to actively seek upper caste/richer section votes by projecting a combination of continuation of better grounded liberalisation programmes and effective governance. The Old Mysore region has been traditionally Congress-dominated, but the BJP has made some gains there. The prestigious Mysore Lok Sabha seat went to the BJP in the last elections overriding the influence of Srikantadatta Wodeyar, a scion of the former ruling family. The latter is attempting to regain the seat this time.

Notwithstanding all this, it is a fact that the communal situation in the state, which has a long history of communal amity, has worsened with the BJP and its allies, if

not actually responsible for this turn, doing little to allay the minorities' fears. It is here that the J H Patel government has scored points. It is difficult to predict how this factor will affect the minority sections; it may allow the NDA to gain ground, but may also result in pro-Janata (United) sections actually deserting Patel. With the first phase of voting this weekend in Karnataka and the turnout expected to be good, the stage is set for some notable changes in the assembly line-up.

ORISSA

Missing the Trees

THE killing of a Roman Catholic priest is the latest incident in the recurring violence in the tribal parts of Mayurbhanj and Keonjhar districts of Orissa. Diagnosing these incidents to be a fall-out of the agenda of Hindu communal organisations or; conversely, retaliation against an international Christian conspiracy to proselytise the tribals only obscures the specificities of the problem that may turn out not to have the geographical spread attributed to it by both sides. Moreover, the effectiveness of the state machinery in using its powers of maintaining law and order and modulating interaction among communities and groups in tense situations needs to be addressed if conflicts arising out of sensitive developments such as religious conversions are to be dealt with.

In this regard the findings of the Wadliwa Commission, set up to enquire into the murder of the Australian missionary Graham Stewart Steins at Manoharpur in Orissa last January, go some way in demystifying the conflict in the tribal areas. The evidence produced before the commission shows that the disruption of established tribal customs and rituals – the discontinuance of sacrifice of hens and goats to tribal deities, engaging in farming on festival days – is at the root of the

For the Attention of Subscribers and Subscription Agencies Outside India

It has come to our notice that a large number of subscriptions to the *EPW* from outside the country together with the subscription payments sent to supposed subscription agents in India have not been forwarded to us.

We wish to point out to subscribers and subscription agencies outside India that all foreign subscriptions, together with the appropriate remittances, must be forwarded to us and not to unauthorised third parties in India.

We take no responsibility whatsoever in respect of subscriptions not registered with us.

MANAGER

incidents of violence. There have been reactions on the other side as well in the form, for instance, of the growing assertion among the non-converted section of tribals in support of protecting cows. The tribals in the area are apparently torn between competing communalisms.

The Wadhwa Commission has also laid bare the failure of the state administration. The embarrassment of the Orissa government over its failure to find and arrest Dara Singh, the principal accused in the Steins murder case, for nine months is obvious enough. And despite the palpable tension in the tribal areas, senior officials of the state came through before the commission as being unaware of the provisions in the law to monitor conversions. The district magistrates of Mayurbhanj and Keonjhar admitted to the commission their ignorance of the Orissa Freedom of Religion Act, 1967 which lays down guidelines for conversions. The commission found that the requirement under the act that persons intending to undergo conversion declare their intention before the district magistrate has been totally ignored all along. The two district magistrates confessed to the commission that they had in fact bothered to ascertain the legal provisions only after the Steins murder. Clearly, the state is armed with legal powers to deal with the tensions which have taken a tragic toll recently in the tribal areas of Orissa. The failure to use these powers, like many other factors relevant to the situation, has been overlooked in the rush all round to make political capital out of the violent incidents.

ELECTIONS

Unanswered Questions

A correspondent writes:

AS the country goes to the polls to elect yet another Lok Sabha, the public mind seems to be overcast by a pall of cynicism. During the last one decade, they have had experience of governments of all political hues and shapes, ranging from the Janata Dal-led minority government of V P Singh to the Congress-led minority government of Narasimha Rao, from the coalitions of different parties headed by Janata Dal's Deve Gowda and later by Inder Gujral to those led by the BJP.

The performance of all these parties in power had left the voters utterly disillusioned. Their different political views notwithstanding, and despite their mutual hostilities, all these parties in power however had shared certain things in common. Whether it was the Congress

prime minister Narasimha Rao, or the Janata Dal's Deve Gowda, or the BJP's Atal Behari Vajpayee, they had all unanimously stuck to one single bent of mind – total unconcern for the basic needs of the citizens: food, shelter, drinking water, medical aid, civic facilities, education, employment. Can any one of these successive governments during the last 10 years claim any success in these crucial areas of human development? It is quite understandable therefore why none of the contesting political parties in the electoral campaign today is addressing these fundamental problems that affect the people. If the Congress accuses the BJP of failing to alleviate these problems, the BJP might well turn back and ask it what it did when it was in power. The non-Congress and non-BJP politicians, who had also been in power in New Delhi, albeit for a short while, will face the same question. For all of them therefore it is better to divert popular concerns from their basic needs to extraneous issues like debates over who won the Kargil war or whether a foreigner should become India's prime minister. These two issues are apparently becoming the main planks of the contestants in their current poll strategies.

Along with this total failure to meet the essential needs of the citizens, the successive ruling parties at the centre also share another common feature: one does not find any basic difference between the economic policies as delineated by the Congress or the BJP in their respective election manifestos.

While in certain constituencies, voters are indeed coming up with these questions when confronted with candidates seeking their votes, there is as yet no concerted and co-ordinated national movement to highlight the basic social and economic issues which have been – and continue to be – neglected by the ruling parties.

Even in the matter of fighting the BJP, one wonders whether the anti-BJP forces are really sincere about their commitment to secularism. In fact, if one looks back at the history of the past decade one would come to the conclusion that it is the constituents of the Third Front who had paved the way for the BJP's gaining strength. To start with, the Janata Dal floundered purely because of personal ego clashes between different leaders. It first split against the background of the hullabaloo raised against the V P Singh-led National Front government over the arrest of the then BJP president L K Advani when he was leading a rathayatra to Ayodhya in October 1990, which led to the withdrawal of BJP support to the government. Instead of

sticking together to resist the offensive of the communal forces, a veteran leader of the Janata Dal, Chandrashekhar with his followers broke away from the party leading to the fall of V P Singh's government the next month – just to satisfy his ambition to become prime minister! He however lost his position within a few months when the Congress withdrew support. The Janata Dal split again on the question of dominating Bihar politics, when George Fernandes due to his rivalry with Laloo Yadav came out from the party to form the Samata Party, to be followed by an acrimonious dispute between Sharad Yadav and Laloo Yadav over who would call the shots in Bihar, ending up with the latter quitting and forming his own party, the RJD. After having successfully split the Janata Dal, both George Fernandes and Sharad Yadav today have thrown in their lot with the BJP. Meanwhile, the Chandrashekhar-led faction of the Janata Dal also split soon when Mulayam Singh Yadav broke away to form his Samajwadi Party. None of these leaders has till today come out with any satisfactory explanation for the splits and the proliferation of their respective parties. Do they have any different ideological perspective and political programmes? Do they have any different economic plan to offer? Citizens do not get any answer to these questions.

But all these splits in the Janata Dal during the last decade had wrought havoc in the Hindi heartland – where its constituents in the 1970-80 period provided a check to the onslaught of Hindu communal forces and also offered the electorate with an alternative to the Congress. The splits created divisions among the supporters of the Janata Dal during the 1998 elections which enabled the BJP to win 18 seats from Bihar – the non-BJP votes having been split between Laloo Yadav's RJD (winning 17 seats) and the other offshoot of the Janata Dal, Samata Party, which opposed him and won 10 seats. In UP again, the non-BJP votes got split among Mulayam Singh Yadav's SP and the Samata Party, the BSP as well as the Congress supporters, helping the BJP win 57 seats.

Had the anti-BJP parties, who claim to be secular, been sincere in their efforts to fight Hindu communalism, they should have first closed their ranks. But apparently, the personal ambitions and mutual animosities among their leaders prevail over whatever little is left of their commitment to secular values, making them totally forgetful of the threat that looms large over the outcome of the present elections.

CURRENT STATISTICS

EPW Research Foundation

There has been an acceleration in the growth of monetary and banking variables. A sizeable growth in bank deposits has been accompanied by larger expansion of banks' total assistance to the commercial sector. RBI credit to the central government has been considerably less than last year, mainly because of large net open market sales of government securities. RBI's ways and means advances have also been far below the half yearly limit

EID-PARRY (INDIA)

Focus on Sanitaryware

A PART of the Murugappa group of companies, EID-Parry (India) (EID) fared well in 1998-99. The company is engaged in the manufacture of complex fertilisers and urea (which account for 29.2 per cent of total turnover), sugar (17 per cent), ammoniumphosphate (16.5 per cent), plant protection products (12.3 per cent), sanitaryware and fittings (9.5 per cent) and tiles (2.2 per cent).

While net sales increased by 5.8 per cent over 1997-98, operating profit improved by 22.1 per cent. Despite a sharp increase in interest charges (up 28.8 per cent) and depreciation (up 21.6 per cent), the company's bottom line was higher by 22.1 per cent. Encouraged by its performance, the company raised the dividend from 50 per cent to 60 per cent.

Keeping in mind the advantages of concentrating on its core strengths, EID has now undertaken a major restructuring programme under which it plans to hive off its non-core businesses. The company has already sold off its ceramic tiles business to H&R Johnson (India) for a consideration of Rs 31 crore. The tile plant in Karaikal in Pondicherry was established in 1996. The proceeds from this sale were to be used to fund the acquisition of the Rs 20 crore Peddar Johnson sanitaryware plant and the remaining stake in Cauvery Sugars. This move is expected to not only improve EID's position in the sanitaryware business but also enhance the profitability of the company's ceramics division as the margins in sanitaryware are comparatively higher than those in tiles. In line with its restructuring strategy, EID also sold off its magnetic tapes (audio cassettes) division to Meltrack India, a subsidiary of the RPG group's Gramophone Company of India.

Meanwhile, EID has already begun enjoying the results of its strategy to concentrate on its main businesses. For the first three months of 1999-2000, the company posted a net profit of Rs 10.2 crore as compared to a net loss of Rs 1.8 crore in the corresponding period last year. While net sales increased by 23.9 per cent over the same period, operating profit surged ahead by 50.5

per cent. The company has also acquired Johnson Peddar, which has a sanitaryware manufacturing facility with an installed capacity of 10,000 tonnes per annum at Dewas in Madhya Pradesh. Besides this new acquisition, EID also has two other plants in Alwar (Rajasthan) and Ranipet (Tamil Nadu), each with a capacity of 12,000 tonnes. The takeover will offer EID a wider product variety, price range and distribution set-up, and also take its total capacity to 34,000 tonnes, making it the undisputed market leader in the segment. Its closest competitor is Hindustan Sanitaryware, which has a capacity of 29,000 tonnes. EID has recovered the ground it had lost after it failed to acquire Raasi Ceramics from India Cements. It will be recalled that Hindustan Sanitaryware beat EID in its bid to take over Raasi Ceramics, acquiring it for Rs 18 crore.

EID's stock presently quotes at around Rs 122 on the Bombay Stock Exchange, discounting its 1998-99 earnings by 12 times.

EIH

Expansion on Course

EIH, which manages the Oberoi group of hotels, is facing hard times with the hotel industry as a whole slowing down. In the past two years, the industry has seen a sharp drop in occupancy rates which have fallen by around 70 per cent. Added to this, average room rent has also dropped by 2 to 3 per cent. The adverse effects of these developments are evident from the company's poor performance in 1998-99. Operating profit declined by 13.9 per cent over the previous year. With depreciation increasing by 16.2 per cent, the company's bottom line fell drastically by 21.8 per cent.

Despite its unfavourable performance, EIH remains committed to its various expansion-cum-modernisation projects. The group currently has hotel projects with an estimated expenditure of Rs 600 crore on hand. These include the proposed 500-room Bandra-Kurla hotel in Mumbai, the 104-room Udaivilasi in Jaipur and the 175-room Trident in Pune, on which work has already started. The company claims that though tight control over general

NA: means not available.

acute recessionary trend as compared to the rest of the industry.

M&M now plans to further broaden its product range by rolling out the country's first noiseless, smokeless and zero pollution three-wheeler vehicle, christened Bijlee. If the necessary government incentives come through, this nine-seater vehicle is likely to cost around Rs 2 lakh to 2.5 lakh. It will initially be introduced in Delhi and Lucknow and will be powered by electric batteries. Bijlee has been introduced with the intention of challenging the two main players in the eight-10 seater segment, namely, Minidor Pick-up from Bajaj Tempo and Vikram from India Scooters.

Meanwhile, increased sales of utility vehicles and tractors as well as restructuring have helped M&M boost its profit in the first quarter of 1999-2000. Apparently, the company's strategy of introducing new products and variants has paid off. Net profit for the first three months of the year was higher by 46.5 per cent at Rs 51.3 crore, compared to Rs 35 crore in the corresponding period last year. Net sales increased by 7.9 per cent over the same period while operating profit improved by 22.1 per cent. Despite a meagre 3.5 per cent growth for the industry as a whole, M&M managed to increase sales of its utility vehicles in the domestic market by 11 per cent from 19,238 units during April-July last year to 21,346 units this year. Market share in this segment consequently increased from 54.5 per cent to 58.5 per cent. Sale of tractors too increased by 14.7 per cent to 19,661 units during April-June 1999 taking M&M's market share from 27.7 per cent last year to 29.7 per cent this year.

The company is introducing a new generation utility vehicle christened Project Scorpio which will be available in many variants and augment its product portfolio. Expected to hit the roads by 2001, the company will invest around Rs 600 crore to develop this vehicle. Project Scorpio will be positioned to take on top-of-the-line utility vehicles like Kijang from Toyota.

The company's massive cost cutting exercise attempted through value engineering and material cost reduction is apparently bearing fruit and 1999-2000 is expected to be a good year. Its stock presently quotes at around Rs 443 on the bourses, discounting its 1998-99 earnings by a comfortable 20.3 times.

Securities Market Infrastructure:

The Indian securities markets have in the last few years gone through a major transformation. NSI, not surprisingly, has been in the forefront of many of these reforms, substantially fulfilling the mandate for which it was set up. The securities market infrastructure now compares favourably with similar facilities available in many of the developed markets and has been one of the major contributory factors for recent resurgence in the securities markets.

NSE has just completed 5 years of successful operations and I feel it may be useful to look back at the catalytic role played by NSE in bringing about major transformation in the capital markets of our country.

Paradigm Shift

As we all know, prior to the emergence of NSE, the market was fragmented with limited liquidity, trading systems were dated and largely opaque, clearing and settlement cycles were long and uncertain, counter party trading member risk was high and investor protection measures were limited.

The processes and procedures set up by NSE marked a paradigm shift in the securities industry. NSE was the first exchange to introduce a nation-wide VSAT driven screen based trading system. The operations, which commenced in Mumbai in mid 1994, rapidly spread all over India, with 4000 trading terminals currently offering investors trading facilities in about 280 towns and cities. The transition, from the time an order from a remote town took up to three days for confirmation to the present time when the same orders and prices are visible on the screen and instantly available to investors across the country, represents a dramatic improvement in investor access to the market. This has served to unify the earlier fragmented market into a single national order book, bringing with it unprecedented increases in liquidity and transparency.

NSE changed the perception that high volume paper based clearing and settlement systems could not be accommodated in less than a fortnightly cycle by establishing a weekly cycle out of 4 clearing houses across the country. The settlements since then have been completed without delays in the face of continuously rising delivery volumes.

SEBI has since announced introduction of the eagerly awaited rolling settlement in a phased manner from December 1999 for depository stocks. It may however, well be some time before the entire market shifts towards rolling settlement. In the interim, I feel it may be desirable to shift settlement cycle for all the depository stocks to a much shorter account period in addition to the current weekly cycle. Such a measure would significantly facilitate the movement towards full-scale rolling settlements.

Risk Management and the Clearing Corporation

NSE introduced for the first time risk containment measures that were common internationally but so far absent from our market place. Mark to market margins, exposure limits etc. brought enormous safety to a fast growing and changing electronic market. Today these measures have become de facto standards in the Indian market.

Recognising that trading members in India were in general under capitalised, NSE encouraged setting up of corporate trading members with higher capitalisation. The fact that an anonymous electronic order book would no longer allow members to assess credit risk of the counterparty necessitated some innovation in this area. To effectively address this issue, NSF introduced the concept of a clearing corporation, and the first such corporation, viz. National Securities Clearing Corporation Limited (NSCCL), was set up by it which commenced operations in April 1996. The NSCCL assures the counter party risk of each member and guarantees financial settlement. Counter party risk is guaranteed through tight risk management systems and an innovative method of on-line position monitoring and automatic disbursement. A large Settlement Guarantee Fund provides the cushion for any residual risk through the period of fine-tuning of risk management systems. As a consequence, despite the fact that daily

traded volumes are now as much as five times the pre-NSE levels, credit risk no longer poses any problems for the market place. The market has now full confidence that settlements will take place on time and will be completed irrespective of isolated trading member defaults. The concept of guaranteed settlements has completely changed the way market safety is perceived.

Dematerialised Settlement

Another area of concern was the serious problem for trading members and investors posed by the emergence of fake, forged and stolen shares on a large scale in the system. The only viable solution to the problem was scripless trading and NSF took the lead along with IDBI and UTI in setting up the country's first depository (NSDI) in 1996.

Dematerialised custody and settlement have since experienced exponential growth. The value of securities dematerialised has crossed Rs. one trillion and the number of beneficial accruals registered with NSDI has crossed the one million mark. The evergrowing popularity of demat settlement has resulted in more than 50% of the paper being eliminated in the settlement process.

The introduction of settlements in demat form has begun to completely change the face of the capital markets. As SEBI made demat settlements mandatory in a number of securities in a phased manner it became possible to introduce rolling settlements. The gradual reduction in physical paper not only reduced risk in the system but also diminished operating costs. It has also facilitated introduction of newer products

such as lending borrowing of securities.

Securities Lending Borrowing

NSCCL introduced an Automated Lending Borrowing Mechanism (ALBM) to facilitate borrowing and lending of securities by members at market determined rates. This system of market driven automated lending borrowing mechanism, using the NSE trading system and network, is unique and has at one stroke provided a nationwide access to facilities for lending borrowing shares in India for the first time. This facility also derives importance from the perceived need to regulate naked short sales (in view of the attendant risks). Our markets are perhaps one of the few in the world which permit such short sales. As lending and borrowing of securities takes off it should become feasible to put in place necessary

restrictions on naked short sales in the Indian markets as well.

Surveillance and Stock Watch

The securities markets in India are characterised by (i) a healthy mix of institutional and retail investors, (ii) multiple exchanges and common listings, (iii) a mix of cash and forward markets, (iv) common members across exchanges and (v) non uniform trading and settlement cycles. This has resulted in significant arbitrage business by common members and clients across exchanges. As a consequence, during times of high market volatility the process of surveillance becomes a particularly complex task. The problem is further compounded by the fact that each exchange is able to monitor open positions of their trading members on a real time basis but is unable to assess positions taken by seemingly unrelated clients across other exchanges, except through client inspections which are necessarily time consuming. There is need to introduce information sharing mechanism which may enable each exchange to monitor group open positions of a client on the basis of exposure to the system as a whole.

NSE, which has put in place an effective margining and risk containment system, is alive to the need to constantly review and strengthen such systems in the light of changing circumstances and emerging windows of risk.

An Inter Exchange Group constituted by SEBI had recommended that all the stock exchanges should have an effective surveillance mechanism. The objective of this system, termed as the Stock Watch System, is to provide suitable timely alerts for the detection of improper trading activity to protect investor confidence and the integrity of the securities market and its participants. NSE was the first exchange to implement the Stock Watch System in May 1998. The system generates real-time

Leadership through Change

alerts, graphs and reports to detect abnormality in trading. These parameterised alerts, graphs and reports are flexible and user configurable and have helped NSE to effectively monitor the trading in the Exchange.

Investor Awareness & Protection

NSE has strongly emphasised investor education and protection. In an effort to spread the habit of investing in equities, NSE has been actively sponsoring and organising investor awareness programmes in different parts of the country. As a measure of investor protection, the Exchange and trading members contribute to an Investor Protection Fund (IPF) which currently has a corpus of Rs.29 crore. The amounts payable in respect of valid claims of an investor have been raised by the NSE to Rs.5 lakhs; this has in turn motivated other exchanges to follow suit thereby increasing the overall protection to investors in the market.

Debt Markets

Unlike developed markets where activity in the debt market exceeds by several times that in the equities market, the Indian debt market has shown limited activity. The activity in this segment has however begun to pick up with daily volumes now reaching Rs.1000 crores. The approach that NSE takes to this market is of (a) seeking to expand the number of participants, (b) building market depth, (c) introduction of new instruments, (d) standardisation of products and practices (e) introducing settlement efficiencies and (f) building of market benchmarks and reference rates.

NSE has taken several steps in building a retail market for debt securities as well as used its experience and expertise gained through the NSCC in introducing settlement efficiencies for debt. NSE has developed market benchmarks in the form of MIBID/MIBOR for overnight and term rates which are now used by the industry to build products off them. NSE continues to make significant efforts in education and training of participants in the latest developments.

Index Products

Scientifically built and maintained indices that have strong tradable characteristics will lie at the heart of a vibrant derivatives market. Towards this end NSE has built an array of such indices which have found acceptance in the market. NSE has entered into a partnership with CRISI and Standard & Poor, USA to provide special impetus to the building of indices in India through a specialised vehicle, India Index Services & Products Limited (IISL).

Information and Technology Initiatives

In line with global trends, NSE is structured and operates much like an information technology company. It boasts of the largest VSAT network in this part of the world with huge and complex web of hardware and software. In recognition, NSE has won several IT user awards and continues to be in the forefront of developments in IT. It has successfully completed Y2K compliance on all its systems and has in place a detailed disaster recovery system including a remote disaster recovery site that mirrors all operating systems. NSE has set up its own

Internet website which is visited daily by over 4 lakh persons.

Building and Certification of Participant Skills

It is an accepted international practice for market intermediaries to be certified. NSE took the initiative to introduce such a facility for testing and certification viz., NSE's Certification in Financial Markets (NCFM), which is only of its kind today in the country. The system is a web based automated examination/testing system that provides for self-administration for the purpose of certification. This certification system is presently available from 7 cities viz., Mumbai, Delhi, Calcutta, Chennai, Hyderabad, Pune and Ahmedabad. The same methodology is now being used for certification for depository participants also.

Exchange Governance

Amongst the many new concepts introduced by NSE in the securities market, the most crucial one relates to the governance of the Exchange. Historically the trading members who provided broking services also owned, controlled and managed the stock exchanges. This model was designed to serve exchanges which were essentially regional in character. This model, apart from facing a severe handicap of a perceived conflict of interests is considered unsuitable for electronic exchanges which have trading members spread all over the country. NSE represent a paradigm shift in that for the first time in the country, the ownership and management of the exchange have been separated from trading rights. NSE is owned by a set of important financial institutions and banks of the country and is managed by professionals who do not

directly or indirectly trade on the Exchange.

It is important to note that the NSE model does not preclude but accommodates member involvement, support and contribution in a variety of ways. In fact a large part of the success of NSE has been the active and strong support of its members. This has taken place through several key committees as also through formal and informal member interactions. NSE will continue to emphasise relationship-building with all its participants, including trading members, investor community and the issuers, whose securities are traded on the Exchange.

Outlook

NSE's vision of the industry will continue to drive its search for newer products and processes. It recognises that technology, which forms its core,

is all the time evolving. NSE is already making preparations to participate in the technological changes that are revolutionising the markets elsewhere. NSE will offer in the near future internet based trading systems not only across the country but hopefully offshore as well. The latter will help to integrate non-resident investors into the domestic on line real time systems.

It is crucial for a developing market such as ours to have in place hedging products against the volatility faced in the market. Recognising that products such as futures and options are new to our market, NSE has spent more than two years building skills and disseminating knowledge in this vital segment. As soon as regulatory approvals are in place NSE will be in the forefront of the developments in derivatives segment of the markets as well.

The mandate placed before NSE was to offer services in the securities industry comparable to best global standards as also to strengthen the market through competitive pressure. While considerable progress has been made, the task is by no means complete. NSE recognises that the securities industry in the coming years will continue to evolve rapidly. Product innovation and improved service standards will increasingly determine leadership in the market place and I have no doubt that given the vision of its top management team, dedication and commitment of its highly professionalised staff and the support it enjoys from the Government, the regulators and the general investing public, NSE is well poised to stay in the forefront of the change.

Calcutta Diary

AM

Forget Kargil, forget even Jammu and Baramula. The menace of militancy so-described is casting a shadow over the entire north-east, Assam not excluding. Assigning the credit for the disturbed state of affairs to over-activism on the part of Pakistan's ISI is laziness par excellence: the real danger lies in the possibility that we might actually come to half-believe some of the fictions we make up.

It is a bit like revisiting the scene of one's crime. Memories crowd in, memories of controversies and encounters. But by now these have acquired a curious non-relevance. The identity of the victors and the vanquished is blurred by time. Not that that matters any more; the co-ordinates of daily living itself are transformed beyond recognition.

Not just grammar, even the lingo itself is different. For instance, the debate over liberalisation has been definitively resolved. Such at least is the verdict of both the media and the ruling politicians. Sway as the world sways, is not that what globalisation is about? And, please, do not probe too intently into the nature of the concrete benefits showered on us as *quid pro quo* of our crossing over to a free-market ambience, say in terms of overall growth, rates of growth of industry and agriculture, the rate of growth of employment, the level of savings and capital formation as well as the capability of the economy to export more so as to neutralise the impact of the rising tide of imports following the withdrawal of tariff and non-tariff barriers on trade.

The cognoscenti will frown upon the habit of raising such otiose questions. Recourse to diversionary tactics, it will be their ruling, calls for a reprimand. Permission to chant the 'mantra' of liberalisation is itself an exhilarating experience; the freedom of choice is a sovereign concept, queries on the quality of beatitude it leads to go ill with this freedom. It is accordingly taboo to refer to the statistics of economic achievements in the past quinquennium or thereabouts. Why not take into consideration other equally worthwhile data instead, such that whoever has been sworn in as the country's prime minister did not waste any time before declaring to the world his undying loyalty, come what may, to the doctrine of liberalisation, and this list includes even the celebrated country bumpkin. True, as the years have unfolded, there have been occasional sparks of conscience at various levels. The system in its totality exercises the casting vote though. Those constituting the top decile of the community know the side their bread is buttered. If the worst

comes to the worst and the other nine-tenths of the population have the temerity to try to obstruct the proceedings, even a war can be arranged; if that diversion too is of little avail, the fraternity from overseas could be appealed to step in and protect the interests of the comprador class. In case there is an actual threat of armed uprising – sporadic at first but gradually gaining in momentum – why, precedents exist, arms and troops from overseas may arrive and ensure that the country does not fall in the clutches of wrong elements. For meanwhile the logic has been honed. A revolt against the ruling classes in the post-liberalisation epoch is, by definition, a conspiracy against the democratic order. Those belonging to the freedom-of-choice camp cannot allow such monstrosities to take shape, *vide* the history, pre- as well as post-World War Two, of the Latin American countries. There will be, now and then, spanners in the works, interrupting the smooth functioning of the democratic-liberalised model. While hitches of this nature are always a nuisance, patience for the sake of democracy's survival over the long haul is an imperative necessity. It is particularly advisable, given the developments in east Asia, to introduce minor amendments to the working agenda. After all, the policy of opportunism has now received the widest possible acclamation as the policy of the principle.

Fortunately for the ruling sect in every country, an extra degree of freedom is provided by the happenstance of the presence of a hostile neighbour across the border. The hostility has an aesthetically pleasing near-symmetrical attribute: politicians in the country adjacent to ours are as much concerned about the well-being of class brethren this side of the border, and, as the adage goes, vice versa. If luck holds, a situation might in fact be contrived to arise where supposedly hostile neighbours, soulmates of the first order, would help our rulers indulge in an out-of-the-ordinary adventure; the advantages are mutual, a Lahore Declaration followed by a Kargil sunrise leaves nothing to imagination, Pareto's optimality is reached among all the parties involved. We gain, our enemy gains, the international arms

merchants, sponsored by the superpower, gain the most.

Take into account the following additional aspect of the matter. Liberalisation has taken care of wild prescriptions aimed at accelerating the pace of growth and narrowing socio-economic inequalities. The consequence has been, at least in the short run, large-scale suffering for the nation's overwhelming majority. It will still not do to lose one's faith in the efficacy of the learning curve. Even the International Monetary Fund and the World Bank are now sounding substantially contrite; they admit, they overdid, in country after country, the pastime of ordaining a free market arrangement accompanied by indiscriminate sale of public undertakings; some circumspection should have been exercised to prevent undesirable elements from taking charge. For countries hustled into ruination by Fund-Bank impetuosity, such as Russia, Thailand, Indonesia and the Philippines, the Fund-Bank confession has arrived, somewhat late. It nonetheless vindicates the tenets of the Ken Arrow postulate which passes as the Impossibility Theorem: no common measure can homogenise the intellectual calisthenics of young Bank or Fund staffers ensconced in a downtown Washington DC bureau and the agony experienced by victims in poor lands of the heartless regimen chalked out for them by those brats. Wait a jiffy though. Even at this late hour, the two international financial institutions are in a position to make a mild atonement for their past follies. They can advise their equally imperialist-minded sister agency, the World Trade Organisation, to cool it off for some while: unbridled imports and a uniform structure of tax legislation for foreign investment that will be manna for transnational corporations are more likely than not to condemn to helpless limbo the so-called Transition Countries.

Fortunately for both Washington mandarins and politicians in the poorer lands, another practice is found to be tremendously helpful in situations of the kind described above. Why not stir up fundamentalist emotions? The trick works in India as much as in Pakistan. One does not require here even a line of control the breach of which could provide the pretext for malign activism. The needful will be done by extra-terrestrial convulsions within the confines of the mind. One can, quite literally, jump on one's nextdoor neighbour, should he or she happen to subscribe to a different religious denomination than one's own. It will be then the start of an exceedingly attractive season of recreation. The fundamentalists will have a roaring time; discovering agents of a hostile neighbouring country here,

there and everywhere will emerge as a full-time avocation. Sooner or later, blood will spill. But why is blood in the body for? The communal frenzy spliced with drummed-up patriotic emotion will be precursor of additional outlays for defence and internal security. No money is available to finance a meaningful programme of universal literacy or a nutrition project for the millions of helpless women and children. Money will however be automatically arranged where the nation's external and internal security is concerned. If not, a further degree of freedom, the sensible Americans will bail both the skirmishing countries out, but only after hitting them hard on the knuckles for their

naughty-boy acts. A feeling of snug comfort spreads like a warm rug across the body on a cold, shivering dog: the superpower has, most kindly, agreed to be our patron and bossman.

The outlook nonetheless refers to be anything but sombre. Forget Kargil, forget even Jammu and Baramula. The menace of militancy, so described, is casting a shadow over the entire north-east, Assam not excluding. Notwithstanding the carnival of elections, life is threatening to come to a screeching halt, even passenger trains have stopped running. Assigning the credit for the disturbed state of affairs to overactivism on the part of Pakistan's Inter-Service Intelligence is laziness par

excellence: the real danger lies in the possibility that we might actually come to half-believe some of the fictions we make up.

The moving hand writes. It writes fiction too. Will the country itself, in due course, be reduced to a fiction? The suspense tucked into this expression of doubt was not a part of the basic data a decade ago. The landscape has therefore changed. And yet it has not, for New Delhi, enjoying the indolence of both the free market and the ersatz glory, courtesy the Americans, of military success, does not accord it formal recognition. Is there much point then in revisiting the scene of one's past indiscretions? The doubt does not abate.

COMMENTARY

Setting the Agenda for Change in Indian Capital Market

Five years of National Stock Exchange

Sucheta Dalal

In India it was not the capital market regulator or the government which drove the change towards automated trading systems and modernisation of stock exchanges. The National Stock Exchange (NSE), through example, has forced a relentless pace of change in the markets. The question now is what next?

CAPITAL market reforms in India have far outstripped the process of liberalisation in every other sector of the economy. In fact, barring issues such as the residual problems of paper-based trades, the lag in bank automation and the absence of derivatives trading, the Indian securities trading infrastructure compares with the best in the world – and in some respects is even better.

A careful study of stock market reforms indicates that in India it was not the capital market regulator or the government which drove the change towards automated trading systems and modernisation of stock exchanges. The National Stock Exchange (NSE), a market intermediary, through example, demonstration and sheer success forced a swift and relentless pace of change in the markets.

The pace of reforms has been so dramatic that it is difficult to recall that less than five years ago the picture of stock trading in India was one of sweaty, raucous jobbers jostling to conduct trades in the crowded trading ring of India's oldest stock exchange. As the NSE completes five years of operation, it is interesting to examine the process of change that ended the saga of broker defaults, counter party risk, low

liquidity, delayed settlements and frequent closures, which were the hallmark of Indian bourses and their antiquated trading systems.

The creation of an independent capital market regulator was the starting point. It laid the grounds for experimenting with a professionally managed stock exchange. When the Securities and Exchange Board of India (SEBI), under chairman G V Ramakrishna, began to draw attention to malpractices on the bourses and demanded better regulation, discipline and accountability it led to a tremendous storm of protest from the brokers and underlined the need for a professionally run alternative.

Around that time a committee headed by M J Pherwani, until then the darling of the brokers, recommended, among other things, the creation of a second stock exchange in Mumbai to be called the 'National Stock Exchange'. Once again, this let off howls of protest from the trading community, but over time the continued recalcitrance of brokers and their intemperate protests against SEBI led to the establishment of the NSE.

Whatever the public posture of support with regard to the NSE, neither government nor the regulator expected it to be more

than a threat to the Bombay Stock Exchange (BSE) forcing it into accepting regulatory supervision and modernising its systems. Nobody certainly expected the NSE to emerge as a clean and efficient nationwide trading system providing investors in 280 cities direct access to a single, safe and transparent system.

The BSE those days was dominated by a broker coterie whose power lay in its ability to dominate trading across bourses in Calcutta, Ahmedabad and elsewhere. The BSE had begun the process of automation in the early eighties, under the leadership of executive director MR Mayya and president Mahendra Kampani. In fact, the duo had gone so far as to decide on the specific computer system that the BSE would buy. But the broker coterie simply forced it to drop the move, fearing that automation and transparency would end their dominance. The process was revived only after the NSE's turnover crossed that of the BSE and continued to rise relentlessly.

NSE's biggest break was probably the fact that nobody expected it to succeed. The broker community had successfully perpetrated the myth, that "technology does not build markets, it is brokers who build markets". They claimed, and even believed, that only brokers understood the complicated mechanics of stock trading and they alone could run bourses. This complacency had two positive consequences: the BSE, by refusing to change, allowed the NSE to set the agenda for change in the capital market without pressure, threat or interference. Since nobody gave the exchange more than a fighting chance of survival, no one coveted the top jobs and this set the stage for six honest and dedicated professionals to take on the challenge of creating a new exchange.

The team first discarded the concept of a national stock exchange only in name

as proposed by the Pherwani committee report. It chose instead to be a truly national exchange which provided investors across the country access to a single screen through a VSAT network. (India was the first country to use a VSAT-based trading system in the capital market. The NSE's VSAT network remains the largest such facility in financial markets linking over 4,000 terminals across 280 cities.) A system which documented the exact time and price of each transaction ensured vastly improved transparency. Ravi Narain, deputy managing director of the NSE says that low expectations from the bourse allowed the team to take "humungous risks". S S Nadkarni, then chairman of the Industrial Development Bank of India (IDBI) and the NSE, allowed the team complete freedom to decide on the systems and structure. All he did was to "check every now and then if everything was going well".

Trading on the NSE took off on November 4, 1994 amidst predictions that it would soon fail. The faceless automated trades of its system had none of the drama and excitement of an open outcry system. The VSAT-based system would never work, one was told. Wait until the first settlement had to be completed, said brokers. A bunch of 'sarkari' development bankers would never be able to conduct a weekly settlement, leave alone one at multiple locations, they said.

When the exchange refused to oblige by collapsing, the dire predictions were postponed to the time when turnover would increase. At the newspaper that I then worked for, not a single day passed without calls from brokers announcing perceived and potential failures of the NSE. Some savvy investment analysts even said that NSE's very transparency and efficiency would be its undoing. Nobody in India wants a clean and transparent market; markets had to provide an avenue for investing ill-gotten money, they argued.

Institutional investors, including those who helped promote the exchange, had as little confidence in its future as the rest of broker community. The NSE had assumed that at least a portion of institutional business would be directed towards it. This did not happen. Even foreign investors, who had never lost an opportunity to ridicule and speak disparagingly about our primitive trading systems took a long time to shift their trades to the new exchange. Some explained that it was because they only had BSE brokers on their approved panels.

NSE's main support came from new brokers who couldn't get on to the BSE's limited membership and from small town investors who had no direct access to the market. The latter group was tired of

waiting for nearly three days to get a trade confirmation, usually at the worst price of the day. Another volume booster was the opening up of arbitrage opportunities between the NSE and other exchanges; these alone accounted for a big chunk of trading.

Predictably, trading picked up very slowly. After six months of existence, NSE chairman S S Nadkarni asked the team "Are you ever going to cross into double digits?" The BSE turnover was then a grand Rs 100 crore per day. It slowly became clear that the NSE was not going to go bust and that weekly settlement on a nationwide basis was possible. Turnover then began to grow at a spanking pace. From single digit turnover for six months, the NSE turnover crossed that of the BSE on November 5, 1995 – exactly a year and a day after it began operations. One significant reason for NSE's growing turnover was the rate of order conversion. In the open outcry system conducted for

barely two hours in a trading ring, just about 30 percent of the orders were actually converted into trades. The automated system raised this to a whopping 90 per cent.

The NSE's clearing corporation proved for the first time that not only were weekly settlements possible but that they could be conducted with clockwork efficiency out of four clearing houses across the country. The settlement procedure was followed by ruthless auctions to ensure that delivery and payment schedules were not messed with. This has to be seen in the context of the BSE insisting to then SEBI chairman G V Ramakrishna that weekly settlements were impossible for any exchange to handle. The BSE those days had a fortnightly settlement cycle and even these were always so off-schedule that it was fairly routine for two or three settlements to be clubbed together.

This was the turning point. As NSE's turnover continued to grow, the BSE

**NATIONAL INSTITUTE OF
PUBLIC FINANCE AND POLICY
18/2, SATSANG VIHAR MARG
SPECIAL INSTITUTIONAL AREA
(NEAR JNU)**

NEW DELHI-110 067

requires SENIOR FELLOW in the scale of pay Rs.16400-450-20900-500-22400 plus allowances as per Institute's rules. Total emoluments at the minimum of the scale will be Rs.27,668/- per month:

Age: Preferably below 45 years (relaxable by Selection Committee in deserving cases).

Qualifications essential: (i) A creditable academic record with Ph.D in Economics and specialisation in Public Economics with a good background in Macro-Economic theory and quantitative Economics, (ii) Publications of high standard (iii) At least 7 years' research or teaching experience in a University or Govt. or in a reputed research institution.

Desirable: Experience in empirical analysis of industrial and/or fiscal policy issues and policy modelling.

Selection may not be confined only to those who apply.

In the event of candidates not being found suitable, the post may not be filled up.

Other things being equal, candidates belonging to SC/ST will be given preference.

Applications indicating qualifications and experience duly supported by true copies of the certificates and testimonials should reach to the Secretary, within 15 days.

launched a blitzkrieg of criticism, alleged unfairness over NSE's national operations and continued to predict potential defaults and collapse of the NSE at every new trading milestone. But nobody missed the writing on the wall. With the BSE's own member acquiring NSE memberships, its leadership realised that it either had to shape up or wither away. It took the smart option and began to implement its own automation programme in a hurry and spruce up its administration to conduct its own weekly settlements without clubbing, delays or glitches. The NSE continued to find ways to make the market fail-safe. Writing in the safety factor:

As NSE's turnover began to shoot up, the larger trades and order conversion also increased market risk. The next agenda was to introduce fool-proof risk containment measures. Unlike international bourses, the NSE had to rely as little as possible on the slow and stodgy legal system for redressal of issues related to broker default or fraud. The choice was to go for multiple risk containment measures borrowed from different types of markets. * It forced members to be adequately capitalised by imposing high network requirements. This attracted corporate members and allowed it to get away from the dominance of the 'fourth generation family broker model'. Next, it introduced a centralised insurance cover for all trading members in June 1995.

* An online risk monitoring system, which was introduced in January 1997, was a big innovation. Over a period of time it began to track open positions in real time, not merely at the end of the day. Brokers who crossed their exposure limits are immediately and automatically logged out of the system without any scope for bias or favour. They are re-connected as soon as they permit the exchange to close out their excess positions or bring in additional margins.

* When trading volumes began to approach the Rs 1,000 crore a day level, NSE decided to tighten up security even further, by borrowing the concept of settlement guarantees from the options and futures exchanges of Chicago. The settlement guarantee was provided through the National Securities Clearing Corporation, which is the NSE's subsidiary specifically set up to handle all clearing operations.

* The high level of automation could not wish away the dangers of fake and forged trades being dumped on the system, particularly since NSE's guarantee initially covered these risks as well. After being hit by deliberately introduced fake and forged certificates on several occasions, they put in place a strong surveillance system, headed by a former police commissioner.

NSE-BSE TURNOVER COMPARISON

* In January 1998 it began a 100 per cent pre-verification of securities introduced to detect fake, forged and stolen shares.

While the NSE modernised the trading system, it was helpless against paper related problems, fake and forged shares and signature mismatches. Its reaction was to promote a depository to push the move towards paperless trading. The Stock Holding Corporation of India, set up in the early eighties, had not made much headway in transiting to a depository and continued to operate as a custodian for the investments of financial institutions. Initially, the NSE tried to work with the SHCIL, but in 1996 it decided to set up the depository on its own. In less than two years, the National Share Depository has made rapid strides and the value of shares dematerialised has crossed one trillion rupees. The introduction of compulsory dematerialisation in select scrips by SEBI has enabled it to move towards a rolling settlement in a few of these stocks.

One of the NSE's significant achievements was to prove that the separation of ownership and management of the exchange from trading rights can create a better, more efficient and transparent trading system. The NSE is owned by financial institutions and managed by professionals, without representation to brokers on its board of directors.

The question is what next? At the end of five successful years, the NSE is no longer the unfancied underdog – and that is when the troubles begin. Its growth now seems choked by bureaucratic and legislative roadblocks, almost as though the authorities want to give other exchanges a chance to catch up with the NSE. This has already begun to impact the NSE. The growth in turnover has not only stopped,

but it has also conceded its number one position with regard to volumes to the BSE in the last week of August. Part of the reason may be SEBI's refusal to allow it to increase trading exposure in line with the imposition of higher margins mandated by SEBI.

The NSE's attempts to introduce Futures and Options trading has also been blocked for over two years for want of legislative and regulatory approvals. It had opted for internationally accepted derivatives trading, instead of the primitive and outdated badla system. However, vague fears about the danger of derivatives trading and the uncertain political situation have kept this business from taking off. From September 6, the NSE kicked off a second three-days settlement cycle, which will run parallel to the regular weekly one. According to brokers, this settlement will offer arbitrage opportunities between the two settlements within the exchange, and could help boost volumes again. Only time will tell whether this turns into yet another significant innovation or just a damp squib.

Its attempts to introduce stock lending through the Automated Lending/Borrowing Mechanism have also received a lukewarm response. Stock lending volumes average barely Rs 50 lakh per settlement. The lack of enthusiasm is attributed to high lending/borrowing charges and the non-participation of financial institutions.

The NSE's debt market is also a sore issue with several of its members who coughed up big fees for the debt segment membership. The exchange, which planned to develop the debt market, has failed to make much headway for several reasons beyond its control. The silver lining is that following Yeshwant Sinha's 1999 budget,

debt trading has slowly begun to pick up and daily volumes have touched Rs 1,000 crore.

But the future is clearly uncertain. The NSE is now a big and formidable player – which will be watched and blocked at every opportunity. Ironically, while stock-brokers are fond of dubbing it a 'sarkari' exchange, it receives very little support or encouragement from the government. For instance, if the mandarins at the finance ministry had devoted to the introduction of derivatives trading even a fraction of the time they did to the reintroduction of badla trading or the expansion of the BSE trading system, India would have been able to boast a full menu of international trading instruments including derivatives.

In fact, the NSE's role in revolutionising Indian capital markets in so short a time is scarcely recognised.

It would be short-sighted to believe that the process of development and modernisation of Indian capital markets can now come to a halt. International money flows and our constant progress towards currency convertibility will put the Indian bourses in direct competition with aggressive and innovative exchanges in the west and the far east. Only constant innovation and aggressive marketing will ensure that trading in Indian shares remains in India. If the government recognises this, it will ensure that the young and innovative NSE is not stymied and killed – after all an exchange is only as good as its best professionals.

ANDHRA PRADESH

Politics of Opportunism

Ambrose Pinto

What does the regional politics of the Telugu Desam of Chandrababu Naidu mean to the people in the forthcoming elections? A critical essay on the emergence of Telugu Desam, the changing leadership of the party and its programmes.

ANDHRA PRADESH was ruled by the Congress Party since its formation till 1982. From 1953 to 1982, a period of 29 years of Congress rule the state had seen 11 chief ministers, the average tenure working out two-and-a-half-years each. The instability of the chief ministerial chair was a direct spin off from the Congress style of functioning. Though Brahmananda Reddy had a majority support in 1971, he was dropped and P V Narasimha Rao was nominated. With the imposition of the CMs came interference by the centre. Almost everything in the state came to be decided in New Delhi. There was dissatisfaction in the state as a result. To please the high command even transfers and promotions of middle ranking officials were referred to the national capital by the nominated CMs. The bureaucracy, the opposition parties and NGOs were outraged. Within the party itself there were groups. The three major factions were of Narasimha Rao, Chenna Reddy and Anjiappa. There were caste formations – reddy and kamma were the dominant groups. Till 1982 seven of the 11 CMs belonged to the reddy community who comprised 12 per cent of the population. The kamma were 8 per cent of the population and yet no CM came from the community. The group had felt marginalised. With less than 5 per cent of the population, two brahmins were chief ministers of the state. That means the reddy

power in Andhra was far beyond their numerical strength. Every fourth MLA in the state was a reddy. They occupied the commanding heights of the village society and operated as the traditional vote banks of the Congress.

The Congress became stronger in Andhra through the years. From 41.3 per cent votes polled in 1957, it received 56.2 per cent votes in 1980. However, the achievements of the Congress were hardly any. The party was voted to power because there was no other alternative. A Planning Commission study had ranked Andhra 14th on development in 1978. The state's position had slipped from eighth rank in 1961 to 14th in 1978. The literacy rate of Andhra was lowest among southern states, a mere 29.9 per cent in 1981. The state public sector undertakings were losing heavily because of mismanagement and political interference. To add to the economic chaos there was political instability, factions within the Congress settling scores against each other. The bureaucracy was in a state of anarchy. With constant change of CMs and other ministers, decisions taken by one CM were overturned by the next. Then there were scandals of land grabbing, etc, involving Congress politicians. It is under these circumstances a new party, Telugu Desam, challenged the Congress in the legislative assembly elections of 1983 and won 199 of 294 seats. The party at its origin drew inspiration

from the DMK and ADMK of Tamil Nadu and made use of the 'Andhra' or 'Telugu' sentiments to capture power.

Like the DMK, Telugu Desam too hurled attacks on the centralising tendencies of the Indian state and lack of autonomy to the states. The major issue of centre-state relations was fiscal devolution and unimpaired state autonomy without central encroachment in the functional spheres of economic and social development. The vast section of the electorate had become disenchanted with the Congress by 1980. Even in pro-Congress states like Karnataka and Andhra the debate on centre-state relations was on. More than the elected state government the powerful popular movements in states were prepared to challenge the central government on the overwhelming centralisation of the central government. There were not many people in the southern states willing to buy the argument that the enhancement of the powers of the state would lead to the weakening of the centre and undermining national unity. All through his campaign in 1983, N T Rama Rao, made it clear that he would be inclined to take the initiative of appointing a committee of enquiry to go into all aspects of centre-state relations and its report would constitute the basis of the Andhra Pradesh government's approach to the central government.

As leader of the Telugu Desam, N T Rama Rao brought the 'Telugu nation question' to the open. By raising the slogan of Andhra self-respect, he posed a challenge to the Congress. In his speeches, NTR explained to the people how the Congress had treated the state as a national property without due consideration to Telugu aspirations of the people, how the high command had imposed inefficient chief ministers at the whims and fancies of the party. His comments on the three chief ministers Bhavanam Venkatrami who had a short-lived reign of seven months, N Jaradhan Reddy and Vijayabhaskara Reddy nominated and removed by the party high command often roused derisive laughter. Indira Gandhi had replaced local leaders with strong local moorings with hand-me-down non-entities without grass roots support. She had utter disregard to local sensitivities.

TABLE: CONGRESS PERFORMANCE IN LOK SABHA ELECTIONS

Year	(Per cent)	
	Votes Polled All Over India	Votes Polled in Andhra
1957	47.8	41.3
1962	44.7	47.9
1967	40.7	16.8
1971	43.0	55.1
1977	34.5	57.3
1980	42.6	56.2

Source: India Today, October 15, 1982

In the 1978 state elections the Congress had won with a thumping majority of 248 seats in a house of 294. But the infighting within the party was so bad that in the crucial municipal corporation election of 1981, the Congress lost out to the communist parties in Vijayawada and to the BJP in Visakhapatnam. The party triumphed because of the inefficient and ineffective policies followed by the Congress Party. There was discontentment both within and outside the party. Andhra was ready for desiring a change which came in the person of N T Rama Rao and his Telugu Desam. The Congress on account of internal infighting and bickering lost its appeal to the electorate.

ENTRY OF NTR

The man behind the party was Nandamuri Taraka Rama Rao, an actor with over 30 years of film career behind him, having acted in 300 films, a household name in Andhra. He had acted as the just ruler and capable of providing good government in his films. It was his personality which acted as the catalyst to activate a process of changes towards a new political build-up. Being wealthy and affluent the first thing that he communicated to his people is that he was not after money and power:

I did not come here for money. I did not come here for status and prestige. I enjoyed all this and more. I came here as a sanyasi to follow you. I have earned money. I have status. And all because you gave it to me (*India Today*, January 1983, p 25).

As an actor NTR did have enough of money as well as status. What impressed the people is his rhetoric of renunciation – service without self. “I came here as a ‘sanyasi’ to follow you”. His saffron garb further mesmerised the audience, giving an impression of a religious figure in secular action. People, specially the poor, need messiahs. NTR’s rhetoric was one of providing salvation. In the party manifesto, NTR stated:

The 35 years Congress misrule has created such a mess that the Telugus have to hang their heads in shame. Despite overwhelming majority of the ruling party in the state assembly, political instability has become the order of the day. The enthronement of four and dethronement of three chief ministers within a span of five years is an indication of the sorry state of affairs. The elected representatives of the people have become mere pawns. They have neither the power to elect their leader nor to impeach him. Nor is all well with the opposition which is hopelessly divided leaving the field free for the Congress(I) to rule the roost. There is no limit to the injustice meted out to the people of the state. It is because of this historical necessity, Telugu Desam has

come into existence in Andhra Pradesh.

The Congress Party in Andhra Pradesh was so centralised that it provide no local autonomy. The constant change of leaders in the state was an indicator of the dictatorial tendencies of the party. The need was to assert Telugu pride. That was the essence of NTR’s message. NTR was able to enter into the Telugu psyche. In his intensive election campaign, he travelled in a specially designed car and made use of modern media like audiotapes. Like his counterpart in Tamil Nadu, he was quick to mock the Congress and assert that for 35 years Andhra had been neglected and humiliated by the people of the north. As a popular scheme, he assured the electorate he would offer a kilo rice at Rs 2 through the public distribution system and midday meals to school children.

Right from the start NTR projected himself as the saviour of Andhra people. To convey his message to the people he used expressions like ‘atma gouravam’ (self-respect), ‘dharma yuddham’ (war of righteousness) and kurushetram (epic war in Mahabharata). One of his cutouts in a public place, had this message: ‘Telugu desam pilustondi, lea, kadaliraa’ (Telugu desam is calling, arise, join). The Telugu Desam Party men used expressions like ‘jaati gouravam’ (honour of the Telugu race) and Teluguvalla gappatanam (the great heritage of the Telugu people).

Pamphlets, cassettes, posters and films were all used to propagate Telugu pride. Songs of the patriot Gurujada Appa Rao and plays and other works of Kandukuri Veerasalingam and Alluri Sitarama Raju were used to tell the people that the party is committed to social reform of Telugu society. These reformers of Andhra Pradesh had advocated equal rights to women, abolition of dowry and equality of all humans. In his speeches, NTR lamented that the land where Gurajada had left his footprints, where Alluri had laboured and produced people like Nannayya, Tikkanna and Errapragada, the trio who had translated Mahabharata into Telugu have fallen prey to rulers in Delhi. With professional skills of the movie world there was a finesse to his appeal. Besides he made use of religion extensively to garner votes. His role in films as Krishna, Karna, Bhishma, Veera Brahmendra Swamy, Sri Krishna Devaraya, Sri Rama and Brahma Nayadu all mythological figures were paraded prior to the election. Of course, a secular interpretation was offered.

The approach of NTR was one of integration of Andhra with the nation. Though he asserted for regional autonomy, he was not a separatist. The Telugu Desam movement was very different in some ways from that of the DMK in Tamil Nadu. In fact, NTR had made it clear that Telugu

Desam does not stand for separatism. While seeking more autonomy for Andhra he asserted: “We stand for national unity and integration. We owe allegiance to the centre and wish to strengthen it so that it could fulfil its responsibilities” (*Deccan Herald*, January 10, 1983). On the other hand, he also stood for local autonomy. His opposition was to a centralised Congress system that looked at India in terms of uniformity. His vision was constitutional – ‘unity in diversity’. While asserting local pride and making use of it extensively to capture votes, he never once made an issue of separatism. His economic programme was populist: He assured during the campaign to make rice available at Rs 2 a kilo through the public distribution system, free midday meals to school children and assistance for weddings of the poor. No one can transform an ailing economic system into a flourishing one with such populist measures. NTR did not make use of the popular support he had for building a strong economy with long-term goals. The consequence was that the same economic problems grew in magnitude. People’s disenchantment led to the loss of power of TDP in the 1988 election. The rice at Rs 2 a kilo proved costly to the exchequer. The midday meals for school children ran into trouble. School teachers were unwilling to handle the scheme. TDP lost the election in 1988. It was returned to power at the state level in 1994 and N T Rama Rao was sworn in as chief minister again. He died in office in 1995. Chandrababu Naidu, his son-in-law took over governance.

AFTER NTR

Chandrababu joined politics in 1978 when he contested the Chandragiri constituency and won. He joined the Telugu Desam when his father-in-law founded the party and got elected in 1989 to the Kuppam constituency. He was re-elected in 1994 and was entrusted with the finance portfolio by his father-in-law. When his father-in-law died in 1995 he became the chief minister at the age of 45. The 1996 elections produced a hung parliament. The United Front, a coalition of 14 parties formed the government with Deve Gowda as prime minister. Because of the strength of Telugu Desam and Chandrababu Naidu’s stature as regional leader, he was accepted as chairman of the United Front government. The 1978 general elections too, it was a hung parliament. Chandrababu Naidu once again proved a brilliant tactician. Though opposed to the BJP, he was more averse to the Congress, his arch rival. Given his home situation in Andhra, he instructed his 12 TDP parliamentarians to abstain from voting against the BJP-led govern-

ment in the confidence motion. For his support, the party was awarded the speaker's post.

Known as a 'modern' chief minister of India, Chandrababu Naidu has received wide applause – from Bill Gates to Atal Behari Vajpayee – for his achievements in placing the twin cities of Hyderabad and Secunderabad on the 'Netlas'. His was the first state to embark on a massive programme of restructuring in accordance with the guidelines of the World Bank and IMF. His first task as chief minister was to fill the empty coffers of the state treasury. One of the instructions of the World Bank was to cut subsidies. Naidu increased power tariffs, water rates and bus fares, while there was reduction in rice subsidy, professional tax and turnover tax on trade was increased. For the rapid growth of the state, he was for borrowings from the World Bank. To instil confidence in investors, he has succeeded in building super class infrastructure including the information technology industry.

Chandrababu wants the state to be fastest growing state in the country. The areas identified for growth are pharmaceuticals, mining, labour-intensive export-oriented units, contract farming, agro-based industry, tourism and information technology. For improving environmental health, he has initiated a campaign for a 'clean and green' state.

According to V Hanumanta Rao who has analysed the state's financial performance during the first two years of Chandrababu Naidu's governance the following facts are quite revealing. When Chandrababu Naidu worked as finance minister in N T Ram Rao's cabinet, in the very first year (1993-94) the state's surplus of assets over liabilities deteriorated to a deficit of Rs 1,302 crore. In 1996-97, his first year as CM, that amount further deteriorated to Rs 5,116 crore. Concretely, while the liabilities rose by about 14 per cent, assets declined by over 4 per cent. The consolidated receipts increased by 12.54 per cent and the expenditure by 15 per cent. Public debt amounted to 26 per cent of receipts. The net deficit in the consolidated fund rose by 91 per cent over the previous year.

A glance at expenditure reveals that the axe of increase in non-plan expenditure fell on social services in 1996-97, from 44 per cent of the total revenue of expenditure to 36 per cent. Along with it loans and grants given to different local bodies in 1996-97 declined. The internal borrowings in 1996-97 were Rs 2,792 crore. Around 82 per cent of this was repayment of principal and payment of interests. Again 93 per cent of receipt of small savings, provident fund and deposits was used for repayment of principal and payment

of interest. Internal debt has increased by about Rs 500 crore every year since 1991-92. In 1996-97 it was up by Rs 1,000 crore. Because the state had no money it postponed repayment of loans to the centre six times in 1996-97. To make matters worse Rs 2,140 crore of the budgeted amount was not spent in 1996-97. It is intriguing that a state under resource crunch was not able to spend even the allotted amounts. The story was the same for external loans. Loans received have not been fully used. What impact does a financial policy of the kind have on the poor of the state?

Though the education expenditure increased, much of the increase was in higher education. On nutrition and medical health, areas of concern for the masses, the expenditure was low.

Under Chandrababu Naidu Andhra Pradesh sought and implemented a World Bank guided Economic Restructuring Programme – a Rs 2,200-crore loan was given to Chandrababu Naidu in spite of sanctions imposed on India for its nuclear explosions. The state won the World Bank's accolades for quality of work and strict adherence to norms. The state has committed itself to reforms. A grant of Rs 3,300 crore was for investment in education, primary health, irrigation, rural roads and nutrition; Rs 280 crore was to be invested for restructuring of public enterprises to be utilised for voluntary retirement benefits. Indiscriminate borrowings have pushed the state into a debt trap. A year ago Andhra had a debt of Rs 20,470 crore and the annual debt servicing used to cost the state Rs 2,722 crore.

Chandrababu Naidu has travelled from district to district exhorting the people to take up activities like road, building on voluntary bases. The Janmabhoomi programme is a community participation programme of self-help. The programme observed every three months for a week was started to focus on the needs of the people. The entire government machinery gears up to work with the people. Students too are involved. The idea is to change the mindset of both people and officials about public causes and to usher in social changes by propagating against the ills of dowry, untouchability, bonded labour and child labour. How serious is the government about the programme? There are different perceptions. While ruling Telugu Desam considers it a success story, the opposition has levelled charges of diversion of panchayati raj development funds to 'janmabhoomi' programmes and have argued that this was more for consolidating vote banks than interest in the rural poor.

N T Rama Rao capitalised on the misdeeds of the successive Congress governments and made use of the 'Telugu

pride' rhetoric to capture votes. But if one has to critically look at the programme of his party, it was no different than of the earlier governments. The very same ills that plagued the Congress regime affected the Telugu Desam's governance. What began as a government with a difference ended up with a government with no difference. That is why Telugu Desam lost power in the election of 1988. Chandrababu Naidu was of course different from his father-in-law. He had options as he took over governance. Both NTR and Chandrababu Naidu were chief ministers from the kamma community. While Congress was perceived as 'reddy raj', given the small percentage of (8 per cent) kmmas in the state, the Telugu Desam government had to project itself as the government of the poor – the minorities, dalits and other OBCs. Chandrababu Naidu was not comfortable with that image. He wanted to project an image beyond the nation to his stage, going beyond caste in the name of modernity and change. He is consciously pro-rich. All his programmes are meant for the wealthy sections of Andhra. For the poor, things have become worse ever since Chandrababu Naidu initiated his reform programmes.

Naidu no doubt has emerged as the most visible chief minister and the darling of the rich because of this pro-rich policies. His concept of development is limited to cities and towns. The construction of flyovers does not provide food, clothing and shelter to the poor. It makes the rich contractors richer and provides better infrastructure facilities to capitalists and traders. The huge amounts spent on industry oriented infrastructure are normally at the cost of rural development. The closure of several state level public sector undertakings has increased unemployment.

Andhra has the lowest literacy rate in south India. The Telugu Desam as a regional party had provided hope of development for Andhra. What has happened is just the opposite. The challenge of development is to improve the quality of life specially of the poor. Progress and development must therefore look beyond the mere growth in per capita incomes to the question of equity. Increasing economic inequality in a growing economy is unavoidable. Privatisation and liberalisation are mantras of the global capitalists whom Chandrababu Naidu has been sensitive and welcoming. Markets do promote efficiency and serve the consumers who have the requisite purchasing power. The fact is markets eliminate physically all those who do not have purchasing power. That is why we have witnessed suicides of farmers in Chandrababu Naidu's state. The major policies to transform any society is abolition of zamindari system,

introduction of land reforms, initiation of community development programmes and panchayati raj institutions. Traditional hierarchical patterns have to be changed. This is possible by doing away with zamindars who continue their exploitation on caste-class lines and do not permit the dalits and the marginalised communities to climb the ladder of progress and development. Andhra Pradesh is yet to see an agricultural revolution. If the Peoples War Group and naxalites have increased their activity, it is because the domination and exploitation of the landlords and money-lenders is on the increase. Even political murders are on the increase. According to the government of Andhra release, during 1990-94, when Congress was in power 132 TDP workers and 195 Congress workers were killed. From 1995-98 of TDP rule 205 TDP workers and 236 Congress workers were killed.

While Chandrababu Naidu was the chairman of the national front of secular forces in 1997 and a critique of BJP, in 1998 his party abstained from voting against the BJP to save the Vajpayee government. While other allies of the BJP were divided on the issue, there was no such division within the TDP. Chandrababu holds that it was better to sail with the BJP than help the Congress come to power. It is the fear of the Congress that pushed the TDP into the BJP's arms. Com-

munalism was never an issue to the TDP. His single principle is survival in politics.

It is the anti-Congress rhetoric that brought N T Rama Rao to power and it is the same rhetoric that continues with Chandrababu. Though in terms of policies there is no big difference between Congress, BJP and Telugu Desam. The last has no intention to go with the Congress, its arch rival in Andhra. But as a shrewd tactician Chandrababu is aware of the dangers of aligning with BJP. He will lose around 20 per cent of the minority votes – Muslims and Christians. And if he loses that vote bank, the party is bound to hand over power to the Congress in the state. Will he emerge as the leader of rural Andhra in the forthcoming elections? Chandrababu's influence will remain restricted to the cities. That too if he does not align himself with the communal BJP. With a big cluster of minority voters in the twin cities of Hyderabad-Secunderabad if he aligns with BJP he may have to take to political sanyasa. In the rural areas the voters may have to find an alternative in the Congress. One cannot sing the regional rhetoric of 'Telugu Desam' while at the same time going out of the way to appease the dons of World Bank, MNCs, TNCs and the business groups.

[My sincere thanks to Fernando Franco, director of research, Indian Social Institute for his comments on the draft of this article.]

TABLE: COTTON PRODUCTION AND CONSUMPTION

Season	Production		Consumption:
	Economic Survey	Textile Ministry	Textile Ministry
1994-95	119	138.50	135.04
1995-96	129	156.50	151.00
1996-97	142	177.90	170.16
1997-98	111	158.00	158.88

Note: Figures of consumption include offtake by mills, small spinners as well as by non-mill consumers

A glance at these figures shows that production figures given by the textile ministry are in line with consumption figures given by it, but those given by the *Economic Survey* are far lower than these consumption figures. It is irrational to argue that cotton consumption can, somehow, be higher than its net availability. If, for instance, one were to accept that the figure of cotton production of 111 lakh bales in 1997-98 as given in the *Economic Survey* is correct, it may be impossible to explain how, in that case, cotton consumption could reach 158.58 lakh bales. Imports in that year were of the order of four lakh bales and exports, 3.50 lakh bales. Thus the net availability would be just 111.50 lakh bales. Looking to the *Economic Survey's* production figures even for earlier years, there was no possibility for any spillover from the previous seasons either. Similar arguments can prove that the *Economic Survey's* figures for the earlier seasons also cannot be correct. Unless the finance ministry can convincingly prove that the textile ministry's figures of cotton consumption are all wrong and actual consumption was far lower than the production figures given by itself, it may have no option but to concede that its own figures of cotton production are wrong. If data on cotton production in the country can thus be wrong how reliable statistics in regard to other crops?

The union finance ministry may well argue that it obtained the data from the agriculture ministry but that may not absolve it of its own responsibility to cross check them before incorporating them in the *Economic Survey*. The union finance ministry cannot be unaware of the fact that the International Cotton Advisory Committee which keeps track of cotton demand-supply position in the entire world completely ignores cotton production statistics given by the *Economic Survey* as well as by the agriculture ministry. When, however, the *Economic Survey* continues to give publicity to such questionable statistics, other government publications as well as school and college textbooks are inclined to follow them. The *Economic Survey* may, therefore find it difficult to avoid the charge of presenting unreliable data on a vital crop in parliament.

How Much Cotton Do We Grow?

M D Dewani

Are the data on domestic production of cotton crop reported in the Economic Survey 1998-99, reliable?

SOME divergence in the cotton crop estimates for the current season given by different agencies is understandable in view of the difference in their sources of information and the methodology followed by in compiling these figures. However, there should be no such divergence in crop statistics for the previous seasons since they can be corrected by comparing them with the actual ginning and pressing statistics which are available, if effort is made, from ginning and pressing factories, as also with figures of cotton production and consumption maintained by the union textile ministry. The union finance ministry appears to have neglected to undertake any such reconciliation of statistics as is evident in the *Economic Survey 1998-99*.

If even a private organisation like the East India Cotton Association (EICA) can compile figures of actual ginning and pressing of cotton in the country every season, there can be no convincing reason

for the union finance ministry not to have done so. It can also issue a directive to all ginning and pressing units to supply such information to it at regular intervals. However this is not being done. The union textile ministry, moreover, regularly publishes in its annual reports figures of cotton production and consumption even for earlier years. The union finance ministry can certainly attempt a reconciliation of its production figures for the previous years by comparing them with these statistics available from the textile ministry. The *Economic Survey*, however, continues to neglect doing so, though this costs it its credibility.

That the figures of cotton production for the past few years given in the *Economy Survey* are not incredible can be easily shown, if one compares them with data on cotton output and consumption reported by the textile ministry in its *Annual Report, 1998-99*:

Scheduled Castes in Transition

Narender Kumar

Education, political representation, development schemes have helped the younger generation of scheduled castes in Haryana to opt for modern occupations and value-orientation. Yet, the landlessness among rural SCs and violation of human rights of rural as well as urban dalits persists.

ACCORDING to the 1991 Census, Haryana has a total population of 1,64,63,468. The scheduled castes (SCs) number 32,50,933 (rural – 26,75,277, urban – 5,75,656) forming 19.75 per cent of the total population in the state [GoI 1991]. Haryana with an area of 44,212 sq kms, is largely an agrarian economy with a burgeoning industrialisation.

In various programmes launched by the government to alleviate poverty a special preference is given to the SCs. Jawahar Rozgar Yojna tries for overall development of unemployed and underemployed people in the rural areas. Haryana has spent Rs 91.96 crore on Jawahar Rozgar Yojna. Under this scheme, which promotes overall development of unemployed and underemployed in the rural areas, Haryana has provided population-based representation to the SCs. Under Indira Awas Yojna, expected to construct houses for homeless SCs, an amount of Rs 985 crore has been spent and 7,081 houses have been constructed during the 8th Plan [GoH 1995:6].

Haryana Harijan Kalyan Nigam has been set up to provide special loans to SCs to purchase buffaloes, vehicles, cultivable land, etc. Under a scheme called 'lai-mai' loan for the purpose of construction of houses, 30 per cent of the loans are reserved for the SCs. The central co-operative banks enrolled almost all SC families in the state and advanced loans to them for small business. A new scheme called 'Apni Beti Apna Dhan' has been launched by the state government to establish respect for the girl child, though the scheme excludes SCs who are class I and class II officers.

Table 1 gives a fairly clear picture with regard to the socio-economic position of SCs in Haryana.

Table 1 reveals the position of SCs of Haryana with regard to income level, landed property, occupational status and educational level. The income level of majority of SCs (59 per cent) in Haryana is up to 10,000 per annum, which shows that a marginal lower middle class is emerging amongst them. Moreover, the

SCs who have been benefited by the various measures introduced by the government, falling in the income brackets Rs 10,001-15,000 (22 per cent), Rs 15,001-20,000 (4 per cent) and Rs 20,001 and above, constitute a sizeable 36 per cent.

The SCs of Haryana are still landless as shown in Table 1. Only 2 per cent have of surveyed SCs have land between 2-5 acres which suggests that there has been hardly any implementation land ceiling in Haryana. Interestingly, there is a noticeable shift in the occupations of the SCs, with only 15 per cent of them performing traditional caste occupations. Wage earners, including landless labourers and industrial workers constitute 61 per cent of the SCs. Nevertheless, it should be mentioned that occupational mobility among the balmikis in the state is negligible.

On the education front, the situation is grim. Sixty-one per cent of SCs are illiterates, indicating that in spite of constitutional provisions, majority of SC children remain out of school. It also illustrates the observation offered by a commentator, Sangeeta Mall, "A number of attempts have been made to camouflage our utter callousness on this issue (illiteracy). The question begging an intelligent answer is that if every year millions of uneducated children become adults, then the burdening adult literacy is going to increase. In which case how is the adult literacy going to reduce the number of illiterate people in the country" [Mall 1997].

The poverty alleviation programmes have benefited the rural SCs. Loans and funds provided by the government to establish small business or purchase buffaloes, etc, has increased the income of SC families. Yet, it must be added that economic change, at occupational level in terms of government, public sector or industrial employment, has been possible because of the political participation of SCs.

Educated SC youths are persuading SC leaders in gram panchayats to forsake their

traditional occupation and take advantage of government schemes to enter new occupations.

Until a few years ago SC houses were outside the village. But now there is a perceptible change in the geographical locations of their houses. The SCs and other castes have their 'badas' or 'ghers' (space for cattle) adjacent to each other. Yet, though interaction among males of different castes has increased over the period, interaction among females of different castes is still uncommon. The superior-subordinate relationship between the dominant castes and the SCs was observed in neither of the three villages studied. When a person belonging to a dominant caste comes in their 'bagadd' (colony), the SCs no more stand from their seats as was the practice earlier.

There are two reserved Lok Sabha seats (Sirsa and Ambala) and 17 reserved assembly seats in Haryana. Table 2 gives

TABLE 1: SOCIO-ECONOMIC POSITION OF SCs IN HARYANA

Variables	No of Respondents (100)
<i>Economic position (per annum)</i>	
Earning up to Rs 5,000	20
5,001-10,000	39
10,001-15,000	22
15,001-20,000	4
20,001 and above	10
<i>Landed property</i>	
0-1 acre	0
2-5 acres	2
6-10 acres	0
11+ acres and above	0
<i>Occupation</i>	
Traditional	15
Government job	11
Business	8
Wage-earning	61
<i>Educational status</i>	
Illiterate	61
Middle pass	24
Above middle	15

Note: * There were 3 students and 2 housewives in the sample survey.

the number of reserved seats for SC members at various levels of the panchayati raj system.

The SCs in Haryana are largely supporters of the Congress but the Bahujan Samaj Party (BSP) lately has created a base of its own among the SCs. The party got 5 per cent votes in the last assembly elections. The SCs are determined not to vote and campaign for candidates who practise untouchability in any form. The 73rd constitutional amendment has brought a change in the traditional power structure of the village with the emergence of SC leadership at various levels. Even if majority of village level SC leaders are illiterate but they have realised that power is important for upliftment of their community. Political empowerment has induced a change-oriented attitude among the SCs in Haryana.

Bhabasaheb Ambedkar argued for the welfare measures for the SCs but his intention was not to make the SCs imitators of mainstream dogmatism and irrationality. Economic development and political empowerment was to bring social respect. Regretfully, such consciousness among all sections of SCs is still lacking in Haryana. The lacuna persists because there

was no discussion on the annihilation of caste system in the constituent assembly; as a result, no conceptual framework exists to do away with caste. R M Pal, a human rights activist and editor of *PUCL Bulletin*, maintains that problems relating to SCs centre around their human rights. He writes, "the culture of human rights and civil liberties espoused by great and good men have not yet taken roots in our country" [Pal 1997:5]. Upholding the human rights and dignity of the dalits is in fact the need of the hour.

[The article is based on an empirical study conducted in January 1996 in three villages of three different districts of Haryana, for the MPhil dissertation submitted to Jawaharlal Nehru University.]

Indo-Bangladesh Cross-Border Migration and Trade

Paula Banerjee
Sanjoy Hazarika
Monirul Hussain
Ranabir Samaddar

Almost all of the outstanding issues between India and Bangladesh continue to be related to disputes along the common border. The article puts forth a few suggestions for successful negotiation of the immigration problem which is also linked to the larger issue of enhanced sub-regional communication and trade.

I The Problem

BOTH India and Bangladesh have proved woefully inadequate in dealing with the reality of the border between the two countries. It is ironic that the border which was drawn by the British in 1947 to rationally re-organise the political space in the region has eventually not only generated its own irrationality, but has also created many new problems for the region. The border, with its long history of movements between people, cultures, beliefs, ideas and customs was completely unreal from the beginning. Land on both sides of the border was mostly cultivable

and was locked, and there were farms within 40 yards of zero point on either side. Perhaps the most important characteristic of the border was that in many cases it was not contiguous. There are 53 rivers in the region which make functioning of the border more complicated. Almost all of India's disputes with East Pakistan related to this border, mostly involving rivers (Report of the Indo-Pakistan Boundary Disputes Tribunal, 1958). The dispute over the boundary between Murshidabad and Rajshahi was a typical example of these initial disputes where even the tribunal decided that the demarcation of the line made by the boundary commission "is

found to be impossible". Even more problematic was that each country had its enclaves within the boundary of the other, meaning that the border was rife with potential for problem.

After the liberation of Bangladesh it was hoped that the border would lose much of its potential for creating disputes and enmity with the improvement of bilateral relations. Sadly, even after more than 25 years of the birth of Bangladesh, almost all the outstanding issues between India and Bangladesh continue to be related to the common border. These include sharing of water-resources of common rivers, CHT, demarcation of maritime boundaries and the ownership of South Moore/Talpaty Island, illegal cross-border activities, illegal migration, Berubari corridor and the granting of entry/exit facilities. Conviction about the sanctity of the border is weaker in this region than elsewhere in India.

Efforts to curb the movement of people and goods, including timber, cattle, textiles, electronic goods, sugar, medicine and kerosene, have failed. Out of a combination of despair and political pressure, the government of India has built barbed wire fencing on parts of both Assam and West Bengal sides of the border. Fencing programme of 358 kms and 159 kms in south Bengal and Assam respectively has been sanctioned. Other measures such as regular patrolling and checkpoints continue. But these have not stemmed the flow of either people or goods; indeed, it is no secret that border guards on either side accept and demand bribes from those seeking to cross illegally. As a result of the influx, the size of which is difficult to estimate, a constant state of tension exists, in Assam in particular and other states of the north-east as well as between migrants, perceived migrants and the host communities. If one is to accept that migration is a natural human phenomenon that occurs in varying degrees worldwide, one must also accept the fact that few countries in the world have successfully contained it, be it a superpower like the United States or a small country like Germany. Again, if one is to go by the premise that immigration, especially illegal immigration cannot be stopped, one must go a step further and say that it can only be contained or regulated. Or rather, it can be negotiated through a process of meaningful economic activities, exchanges, regulatory mechanisms, and above all through dialogue.

The problem of cross-border migration is sometimes complicated by religious factor. Either the people of the minority communities look to the option of taking

shelter in the neighbouring country exasperated with majoritarian insensitivities, or remain potential refugees or illegal migrants. During 1972-1993, a total number of 41,25,576 people arrived in India from Bangladesh. Out of that a total of 8,36,524 overstayed (difference between the immigration and emigration figures). Of them 5,38,501 were Hindus (GOI data).

II

Some Policy Suggestions

In terms of the Indian side of the border, particularly on the eastern side of Bangladesh, some specific suggestions that require inputs from the legal specialists for improvement and better implementation are given below. These suggestions need more study and detailed work.

(1) A system of identity cards acceptable to local population, particularly those living on the border in the eastern and the north-eastern region has to be ensured.

(2) While the system of visa for nationals of either country will continue, for those who cannot or do not want to use the visa system for economic and quasi-economic reasons, a specific, time-bound legal system sanctioning their presence in the host area for mutual economic benefit of both sides, legal and acknowledged, has to be devised. We can take the specific case of the Indian border district of Dhubri that shares both a river and land border with Bangladesh. The process of acquiring a passport (for which one has to travel eastward in an opposite direction, to the capital city of Guwahati) and a visa (for which one has to travel again to Calcutta) are both cumbersome and time-consuming. It is therefore, often tempting to simply cross the contiguous border 'unofficially' by paying some money to the dalals or brokers who arrange for a quick and safe cross-over for almost a paltry sum. A less cumbersome and more practical system of arranging for both passport and visa in the region will help in turning many such 'unofficial' border-crossing into legal entrance and thus help in a meaningful monitoring and negotiation of the phenomenon.

(3) This will involve the development of a scheme to allow migrants to come legally into the region on the basis of work permits issued by a Central Work Permit Authority with the backing of the relevant state set up by an Act of the Parliament, with specific clauses involving the officials of the local state and village-level administrators who will act as checks and balances to each other ensuring that no one group becomes too powerful so as to be able to bend the system. This may be worked out in association with the home

ministry as well as ministry for law and company affairs. A retired Supreme Court/high court judge may head such a panel and a member of the NHRC may be associated with it.

(4) Since the permits are intended to discourage illegal migration, and promote healthy economic co-operation at sub-regional and local level of both sides, the preliminary step may be that the permits be issued to groups (of say, 20 or so) rather than to individuals. It should be allowed in the following fields: agricultural operations at harvest time; construction; boat-building; fishing and allied activities. In doing so, the following procedure might be followed: the work permits could be issued at the border at posts set up for this purpose by cells that would include at its top a representative of the district magistrate with one senior member of the local panchayat or village council system, a police officer, a member of an NGO or some other public organisation, a representative of the labour board, with one of these five being a woman. Since the border is long, a system of such posts needs to be worked out either situating them at present places of checkpoints or beside them.

(5) The permits will be issued on spot after verification of the following documents: (a) the identity of the applicant(s) as proof of nationality/residency; (b) a clear statement on the place he/she will be residing for a maximum of next one year (work permits will be given for a maximum of one year to begin with) and the name of the employer who or whose representative must be present for the issue of the permit with supporting documents from his side; (c) a document of undertaking signed by the employer stating the employer's responsibility for the immigrant group/individual and his/her duty to report to the local authority (preferably local labour board) three times in a year; one, at the time of arrival to register; two, after six months to reconfirm their presence; three, at the time of departure at the end of the year. If the permit is to be extended, it can be done by the DC or the labour commissioner of the relevant district, for a period not beyond another two years; (d) the work permit will carry the photograph of the permit holder and will be laminated with his thumb impression/signature on the document to prevent misuse of the same; (e) the permit holders will have no voting or political rights but will have access to courts of the host country if their civil rights are injured in any way and will be permitted to receive payment for services at the same level as local workers and repatriate their savings to their home country; (f) the entire

arrangement will also give due consideration to the rights of local citizens while making use of a dynamic human resource.

(6) For the Indo-Bangladesh border, an autonomous bi-national commission can be formed to act as a flexible instrument for formulating strategies of co-operation. (a) such a commission will form temporary working groups of local parallels as existing between West Bengal/Assam/Meghalaya/India and Bangladesh on matters of land-holdings, employment, social and economic resources and formulate policies based on common factors and the market; (b) border demography, settlement problems in border areas, ethnic divisions within the region, viability of developing environmental provisions to convert the area into a self-sustaining unit with linkages to both countries will be ascertained by groups set up by the commission, the ultimate goal being to hand over local administration to largely de-centralised administrative units which can work with greater competence and stability in comparison to the vested interest groups and consequently the promotion of an atmosphere of greater understanding between two countries and also in the sub-region.

(7) Keeping in mind the enormous problems of surface communications suffered by north-east Indian states, it is strongly recommended that Bangladesh seriously considers the allotment of exit/entry visa facilities that will allow them to travel to other parts of the Indian mainland through Bangladesh territory. Bangladesh will generate a substantial revenue from this traffic. It is recommended that such exit/entry visa facility be available to Indian nationals who are residents of the seven north-east Indian states – Tripura, Mizoram, Manipur, Meghalaya, Assam, Nagaland and Arunachal Pradesh – for a period of four days. In case of transport problems due to unforeseen calamities such as floods the visa may be extended for another three days. The total duration of the exit/entry visa should not be for a period of more than seven days. Bangladesh already has a mission in Agartala that can be empowered to issue the exit/entry visas on the basis of an agreed amount of foreign exchange endorsement. In issuing such visas the Bangladesh mission may be guided by the permanent address of the visa applicant's passport.

(8) The proposed passenger bus service between Calcutta and Dhaka should be extended to Agartala and if possible to Silchar and Guwahati. This will provide cheap means of transport to residents in the area.

(9) To facilitate legitimate growth in Indo-Bangla border trade, customs and banking formalities of both countries should be simplified through direct interaction between Chamber of Commerce in Bangladesh and those in north-east India. Existing border area markets (hats) should be identified to develop legitimate border trade.

III Larger Policy Issues

A successful negotiation of the immigration question is linked to the larger issues of enhanced sub-regional communication and trade, though this calls for a separate paper. Below we present some broad issues.

(1) In today's world, it is appropriate to emphasise the common elements, the need for greater co-operation and the need to abandon an 'isolationist mind-set', particularly in the backdrop of the partition of the subcontinent which has put both India and Pakistan/Bangladesh into serious economic disadvantage apart from the immense human cost that it has involved. The economy of East Pakistan remained as blocked as that of India's north-east. Minus East Pakistan/Bangladesh, the distance between the east and the north-east increased substantially, thereby acutely burdening the region with a quasi-permanent state of underdevelopment and underdeveloped communication. Experts have pointed out that the road distance between Calcutta and Agartala is about 2,000 kms longer than the distance between Calcutta and Mumbai. However, bulk commodities can be transferred from Calcutta or Haldia by ship along the coast to Chittagong port in Bangladesh, thereafter taken by Bangladesh railroad to Akhaura (about 100 km), adjacent to Agartala, and finally transported by Indian trucks to various destinations in the north-east, with the cost of transportation reducing drastically and the revenue of the Chittagong port increasing. India and Bangladesh, particularly the entire sub-region will gain consequently. Bangladesh can gain handsome royalty for the use of Chittagong port and the railway between Chittagong and Akhaura. This will help Bangladesh set off the current adverse balance of trade with India and have a trade surplus with the neighbouring states of the sub-region. Bangladesh does not have enough goods for export to India, but can export services to the region. Then again, this traffic will improve the berthing facilities at Chittagong. The additional traffic to Akhaura will open up employment opportunities along the route. The units of the sub-region enjoying common

facilities can undertake partial burden to construct berths at Chittagong port dedicated to the traffic, and also railway wagons and may also save foreign exchange.

(2) Another alternative is the re-activation of riverine traffic between Calcutta and Assam through the Sundarbans and the Bangladesh river system. There was considerable traffic on this route until 1965, when it was closed. On paper this route was revived after the independence of Bangladesh in 1971. But it has remained on paper only because of lack of investment necessary for maintaining a navigable channel all the year round, and because of inertia. According to experts, the river route is navigable all through the year from Calcutta up to the river port Ashugani on the Meghna, or even up to Karimganj. The distance between Ashuganj and Agartala is only about 40 km. What is needed is the activation of this route with advice and help from inland water transport experts of both the countries and also from Germany, the Netherlands and France which have traditionally used inland water-borne traffic. What is lacking is the political will in this region to give effect to this concept. With Haldia, Calcutta, Chittagong, Akhaura, Ashuganj and Karimganj becoming the pivotal points of the coastal and rail routes the entire sub-region will gain enormously. We may think of the co-ordination of the roads also with the opening of the new Jamuna bridge. What is principally needed is a fresh outlook which does not regard the common border and the common river as a burden but an asset to the entire region, i.e., the sub-region.

(3) The two countries as well as the units in the sub-region must give up its old attitudes and must get away from the habit of mutual suspicion, and treat questions of security or espionage as of lesser consequence to the prospect of economic co-operation between the two countries, and particularly in the region. Once the two countries as well as the units in the region decide on improvement of trade, utilisation of common resources, arrangement of transit and mutual co-operation in investment, they will realise that political differences are of secondary importance. In short, to strengthen the communication network we need in the first place a sub-regional perspective before we adopt a metropolitan outlook symbolised by an Asian highway that covers India (West Bengal and the north-east) and Bangladesh and can be utilised for the maximum benefit of the entire region. The truth is that the Asian highway can bring economic improvement in the region only when it is linked with a network of local com-

munication systems of rail, road and water transport.

(4) The improvement of air transport is also crucial here. Not being a member of the IATA the Bangladesh Biman (Bangladesh Airline) has its freedom and advantage to operate at a lower rate than most other international airlines. Once the Guwahati airport turns international, the Biman will have easy access to Guwahati, the gateway to the north-east. Besides operating passenger services, it can have cargo services and hence can export/re-export certain goods from Assam/north-east to the international market rapidly.

(5) Trade relationship can be augmented further when units in the sub-region have access to each others' markets. In this context it is important to note that most of the trade now is conducted illegally depriving both the government of Bangladesh and its neighbouring states. In such illegal trade, private traders have built a nexus with some of their government officials and corrupt politicians, which has to be countered at all cost.

(6) Some new items may be taken up for trade: to take the example of the north-east, the Meghalayan oranges and pineapples (which may be exported to Bangladesh and thence to Europe and the west Asia), in both raw and processed forms, so also the ginger, a kilogram of which costs Rs 120 in Dubai whereas the same costs Rs 10 in Guwahati. The famous Bangladeshi jamdaani and other high quality saris will have good market demand in Assam. Assam in turn is famous for her paat and mugaa silks which could be sent to Bangladesh markets. Trade between India/Assam and Bangladesh has not increased substantially despite 12 years of South Asian Association for Regional Co-operation and the South Asia Preferential Trading Agreement. What is needed today is a fast track approach and equity in trade. Trade relations lead to improvement of relations on a broad scale, like exchange of cultural troupes, artists, persons engaged in literary work, journalists, academics, researchers, and others.

(7) Finally, a joint sub-regional project to study the problem of borders and immigration should be initiated soon with a stipulated time-frame to complete the study. Admittedly hurdles are there and pose a challenge to our collective intellectual capacity. They also impel us to negotiate the problem of borders and immigration in the broader context of economic co-operation, sub-regional co-operation, cultural dialogue and human security in this part of the globe which can hardly afford to remain an island in a fast-changing world.

Economic and Political Weekly September 4, 1999

Bank Muscat International S.A.O.G

BANGALORE BRANCH

(Incorporated in the Sultanate of Oman with Limited Liability)

Investments

All investments held by the bank are current investments in view of the short maturity period

Government of India securities and Treasury Bills are stated at cost

Credit Losses

The Bank has classified its loans and advances as per the asset classification norms prescribed by the Reserve Bank of India. Provisions for credit losses and writeoffs are made whenever necessary to conform to the prudential accounting norms prescribed by the Reserve Bank of India for asset classification and income recognition

Cash and cash equivalents

Cash and cash equivalents consist of cash on hand and balances with banks

Fixed Assets

Premises and Equipment

Improvements carried out to the lease hold premises are capitalised and depreciated at 20% per annum on straight line basis

Equipment and other Fixed Assets

Equipment, namely computers including computer software, fax machines, and other electronically operated machines are recorded at cost and depreciated at 20% per annum on straight line basis.

Furniture and Fixtures

Furniture and Fixtures including those purchased from previous lessee are recorded at cost and depreciated at 20% per annum on straight line basis.

Preoperative expenses

The bank has commenced business from 9th of September, 1998. All expenses incurred prior to commencement of business, that were not capital in nature, are being treated as a deferred revenue expenditure and are being amortised over a period of five years

Income recognition

Interest receivable and payable are recognised on an accrual basis. Other fees receivable or payable are recognised when due. The bank follows a procedure of income recognition which satisfies the norms prescribed by the Reserve Bank of India. Interest income includes interest tax collected from the customers. Discount income on treasury bills is accrued periodically and recognised in the Profit and Loss Account.

C. Notes on Accounts

Net Profit/Loss

The net income/loss disclosed in the Profit and Loss Account is after provision for interest tax.

Preoperative expenses

Preoperative expenses of Rs. 1,522,770/- written off (proportionate) in the accounts represent expenses incurred prior to commencement of the business.

Current Investment

Following the YTM method of valuation in compliance with RBI requirements, no adjustment has been made in respect of the cost of investments as the market value exceeds the cost

Treasury Bills are valued at cost.

Twelve month floating rate non-convertible bonds are valued at cost

Branch Inauguration Expenses

Other operating expenses include Rs. 4,155,814/- being the expenditure incurred by the bank on account of inauguration of the bank's branch in India. The entire expenditure has been written off in these accounts.

Taxation

There is no tax liability for the period in view of the loss and provision for interest tax has been made on eligible interest under the Interest Tax Act, 1974.

Revaluation Gain/Loss

The revaluation gain/loss in respect of foreign exchange contracts is being accounted in the Profit and Loss Account as per FEDAI guidelines.

Location of Branch

The Indian branch of the bank as at 31st March, 1999 is at Bangalore.

Compliance of Sec 11(2)(b)

The bank has lodged approved securities of the face value of Rs. 20 Lakhs with the Reserve Bank of India under Sec 11(2)(b) of the Banking Regulation Act, 1949 for the period ended 31st March, 1999.

Capital Adequacy Ratio

The Capital Adequacy Ratio of the Bank Tier I as at 31st March, 1999 as computed under the guidelines issued by the Reserve Bank of India is 212.45%.

Bank Muscat International S.A.O.G

BANGALORE BRANCH

(Incorporated in the Sultanate of Oman with Limited Liability)

Note:

Being a startup year for the bank, most of the funds have been deployed in other than 100% risk weighted assets. As the loan portfolio builds up, the CAR will reduce.

Substantial loans have been provided against 100% cash collateral. Hence, the high CAR for the current period.

In terms of guidelines issued by the Reserve Bank of India, the following additional disclosures are made:-

a. Capital Adequacy Tier I Capital	212.45%
b. Interest income as a percentage of working funds	3.34%
c. Non Interest income as a percentage of working funds	1.08%
d. Operating profit as a percentage to working funds	N.A (being loss for the period)
e. Return on assets	
(i) Operating Profit/Average Earning Assets	- do -
(ii) Net profit/Total Assets	- do -
f. Business (deposits and advances) per employee	Rs. 75.29 Lakhs
g. Profit per employee	N.A (being loss for the period)

Y2K Compliance

Adequate steps are being taken to ensure that the bank's IT infrastructure is fully Y2K compliant before December 1999

Comparative Figures

This being the first accounts relating to the operations of the Bank in India, there are no comparative figures.

AUDITOR'S REPORT ON THE ACCOUNTS OF THE INDIAN BRANCH OF BANK MUSCAT INTERNATIONAL S.A.O.G

We have audited the attached Balance Sheet of the Indian Branch of Bank Muscat International S.A O.G (Incorporated in the Sultanate of Oman with Limited Liability), as on 31st March 1999 and the Profit and Loss Account of the Indian Branch of the Bank for the period from 9th September 1998 to 31st March 1999.

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read with the provisions of Section 211 and Sub-Section (5) of Section 227 of the Companies Act, 1956.

We report that:-

We have obtained all information and explanations which, to the best of our knowledge and belief, were necessary for the purpose of our audit and have found them to be satisfactory.

The transactions which have come to our notice have been, in our opinion, with the powers of the Indian Branch of the Bank. In our opinion, proper books of accounts as required by law have been kept by the Indian Branch of the Bank so far as appears from our examination of those books.

The Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of accounts.

Attention is invited to:-

Note B2 in Schedule 17 regarding conversion of foreign currency balances and forward exchange contracts. Note no 11 regarding Y2K compliance. It may be noted in this context that our audit is not intended, designed, or performed to express an opinion on the same.

In our opinion, and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, read with other notes thereon, give the information required by the Companies Act, 1956, in the manner so required, for the Banking Companies and give a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31st March 1999 and its loss for the period ended on that date.

**SCHEDULES FORMING PART OF THE ACCOUNTS OF THE
INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1999****SCHEDULE 18****NOTES ANNEXED TO AND FORMING PART OF THE FINANCIAL STATEMENTS OF THE
INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1999****A. STATEMENT OF ACCOUNTING POLICIES****i) BASIS OF PRESENTATION**

The financial statements of the Indian branches of Citibank N.A. ('the Bank') have been prepared under the historical cost convention on the accrual basis of accounting in accordance with generally accepted accounting principles and conform to the statutory requirements prescribed under the Banking Regulation Act, 1949 and current practices within the banking industry in the country.

ii) FOREIGN CURRENCY TRANSLATION

Foreign currency assets and liabilities are translated at the balance sheet date at rates notified by the Foreign Exchange Dealers Association of India ("FEDAI"). Revenues and expenses are translated at rates prevailing on the transaction date. Foreign exchange trading positions including spot and forward contracts (other than those from foreign currency swaps) are revalued monthly at prevailing market rates (notified by FEDAI) and the resulting gains and losses are included in Foreign Exchange revenue. The profit or loss on revaluation is recorded in the profit and loss account is the present value equivalent using appropriate discount rates. The revaluation gain/loss in respect of foreign exchange contracts are being consistently accounted in the profit and loss account as per FEDAI guidelines in preference to AS-11, as required under the Reserve Bank of India (RBI) Circular No. DBOD No. BP.BC.24/21.04.048/99 dated March 30, 1999.

Certain foreign currency deposits are swapped into Indian Rupees at the spot rate prevailing on the date of the swap. The premium or discount on the swap arising out of the difference in the exchange rate on the swap date and the maturity date of the underlying forward contract, is amortised over the period of the swap and recorded as interest expenses.

Foreign currency swaps are marked to market using respective discount rates for rupee and foreign currency cash flows. All conversions are then recorded at spot rates notified by FEDAI. The profit or loss on revaluation is recorded in the Profit and Loss Account. The notional value of these swaps are recorded as contingencies.

Foreign currency options are recorded as contingencies at their underlying notional principal amount. As these are fully hedged contracts, the profit or loss on these contracts is recorded in the balance sheet under other assets and other liabilities to reflect the credit risk on these transactions.

iii) ADVANCES

Advances include portfolio purchases and are stated net of provisions and interest in suspense. The Bank has a consistent internal policy of classifying its commercial and consumer loans and advances. Provision for credit losses and write-offs, satisfy the prudential norms prescribed by the RBI for income recognition, asset classification and provisioning. All provisions against doubtful advances are made on a gross basis with tax relief being accounted for only in the year of write-off. Advances securitised are recorded as sales.

iv) INVESTMENTS

All investments held by the bank are 'current investments' and are valued at the lower of cost and market value or below that value (book value) in aggregate for each category in compliance with the RBI requirements. Treasury Bills, Capital Indexed Bonds, Certificate of Deposit, Commercial Paper, Pass Through Certificates and Floating Rate Notes are valued at carrying cost. Provisions and contingencies include valuation adjustments in compliance with RBI Circular No. BP.BC.28/21.04.048/98-99 dated April 15, 1999.

Market value is determined in accordance with RBI Circular No. BP.BC.28/21.04.048/98-99 dated April 15, 1999 which sets out indicative maximum market quotes/yields. Shares, debentures and Capital Indexed Bonds are valued in accordance with RBI Circular Nos. BP.BC.28/21.04.048/98-99 and DBOD no. BC.8/12.02.001/97-98 dated April 15, 1999 and January 22, 1998 respectively.

Repurchase and reverse repurchase transactions are considered as separate sale and purchase contracts. Commitments under these transactions are disclosed at contracted rates and the excess of contracted rate over market value is recorded in the profit and loss account.

**SCHEDULES FORMING PART OF THE ACCOUNTS OF THE
INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1999****SCHEDULE 18 (contd.)****NOTES ANNEXED TO AND FORMING PART OF THE FINANCIAL STATEMENTS OF THE
INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1999****v) PREMISES AND EQUIPMENT**

Premises and equipment are stated at cost/valuation less accumulated depreciation. Assets purchased prior to April 1, 1997 are depreciated either on a WDV basis or on SLM basis while assets purchased after April 1, 1997 are depreciated only on SLM basis with reference to the estimated useful lives of the assets. The following depreciation rates are currently used

Asset Description	Depreciation Rate (% p.a.)
Land and Buildings	2.00
Installations, Furniture and Work of Art	10.00
Equipment	15.00
Computer Mainframe/Hardware/Software	20.00/50.00
Personal Computers	33.33
Vehicles	33.33

Certain premises in India belonging to the Bank were revalued in the financial year ended March 31, 1994 and March 31, 1997 and an incremental value of Rs 686.6 million and Rs. 6.2 million respectively was credited and debited to Revaluation Reserve account. Current year depreciation amounting to Rs. 29.1 million on the net enhanced value of those assets has been charged to Revaluation Reserve account. These properties have been revalued during the financial year ended March 31, 1999 by an approved valuer and the incremental value of Rs. 38.5 million has been brought into the books of account and credited to the Revaluation Reserve account.

vi) STAFF BENEFITS

Contributions to the Pension Fund and Superannuation benefits for its employees are fully funded with the Life Insurance Corporation of India.

vii) INCOME RECOGNITION

Interest income is recognised in the profit and loss account on an accrual basis, except in the case of interest on non performing assets which is recognised as income on receipt.

Fees and commission income is recognised when due.

viii) NET PROFITS**A. The net income disclosed in the Profit and Loss Account is after:**

- Accounting for credit losses
- Provision for taxation
- Other usual or necessary provisions
- Valuation adjustments in respect of investments
- Charge for Head Office and Administrative Expenses for the year.

B. The Bank has retained in the "Properties Investment Reserve" as at March 31, 1999 Rs. 619 million (1998: Rs. 619 million) as per the RBI guidelines.**C. Other Accounts under the head "Other Liabilities" and "Other Assets" include amounts pending transfer to appropriate accounts.****D. Bills received from constituents for collection on their behalf are controlled through memorandum registers and are recorded in financial ledgers only when collected. These bills for collection outstanding as at the year end have been stated in the Balance Sheet.****E. The Bank has to lodge additional securities with the Reserve Bank of India u/s 11(2)(b) of the Banking Regulation Act, 1949 amounting to Rs 240,000,000 for the year ended March 31, 1999.****F. Other Investments include Pass Through Certificates Rs. 692,726,803 (1998 - Rs. 625,803,858).**

(Incorporated with Limited Liability in U.S.A.)

**SCHEDULES FORMING PART OF THE ACCOUNTS OF THE
INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1999**

SCHEDULE 18 (contd.)

**NOTES ANNEXED TO AND FORMING PART OF THE FINANCIAL STATEMENTS OF THE
INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1999**

- G. No provision has been made for claims amounting to Rs. 352.3 million decreed against the bank against which appeals filed have been admitted by the Supreme Court of India and Rs. 102.5 million in respect of which the Bank is in arbitration. The Bank has been advised that there are good and reasonable chances of success in the appeal and in the arbitration. These balances are included in other assets.
- H. "Other Liabilities and Provisions" includes an amount of Rs. 2,250 million representing sub-ordinated debt bearing a coupon rate of 13% p.a. payable semi-annually and maturing on June 26, 2006.
- I. The Capital Adequacy Ratio of the Bank as at March 31, 1999 as computed under the guidelines issued by the Reserve Bank of India is 10.00% (1998: 8.61%).
- J. Previous year's figures have been audited by a firm other than Bharat S Raut & Co. and certain previous year's figures have been regrouped and reclassified.
- K. The Indian Branches of the Bank as at March 31, 1999 are at:
Mumbai (Fort and Nariman Point); Calcutta (Chowringhee Road); Chennai (Anna Salai);
New Delhi (Parliament Street); Bangalore (M.G. Road); Pune (East Street); and Hyderabad (Begumpet).
- L. In terms of the guidelines issued by the Reserve Bank of India, the following additional disclosures are made:

	(1998-99)	(1997-98)
Percentage of Net NPAs to Net Advances	2.08%	0.57%
Capital Adequacy Tier I Capital	7.23%	8.29%
Capital Adequacy Tier II Capital	2.77%	0.32%
Interest income as a percentage to working funds	10.20%	10.89%
Non interest income as a percentage to working funds	3.99%	3.85%
Operating profit as a percentage to working funds	3.89%	4.41%
Return on assets	2.32%	2.85%
Business (deposits plus advances) per employee (Rs. Thousands)	83,189	80,375
Profit per employee (Rs. Thousands)	764	781

(Incorporated with Limited Liability in U.S.A.)

**AUDITORS' REPORT ON THE FINANCIAL STATEMENTS OF CITIBANK N.A. –
INDIAN BRANCHES UNDER SECTION 30 OF THE BANKING
REGULATION ACT, 1949.**

We have audited the attached Balance Sheet of Citibank N.A. – Indian branches ('the Bank') (incorporated with Limited Liability in the U.S.A.) at 31 March 1999 and the annexed Profit and Loss Account for the year then ended. We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of the sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with notes thereon, are not required to be drawn up in accordance with Schedule VI (revised) to the Companies Act, 1956. The accounts are therefore drawn up in conformity with Forms "A" and "B" (revised) of the Third Schedule to the Banking Regulation Act, 1949.

In respect of matters mentioned in note 18G to the financial statements, we are unable to form an opinion on their outcome and consequently their effect, if any, on the results of the Bank for the year.

In our opinion, subject to the effect of such adjustments, if any, that might have become necessary had the outcome of the matter referred to above been known, the financial statements give a true and fair view of the state of affairs of the Bank at 31 March 1999 and of its profit for the year then ended.

In our opinion the accompanying Balance Sheet and Profit and Loss Account comply with Accounting Standards referred to in sub-section 3(C) of Section 211 of the Companies Act, 1956, to the extent applicable except for non compliance with Accounting Standard 11 as explained in note 18A(ii).

We further report that:

- The financial statements are in agreement with the books of account and give the information required by the Companies Act, 1956, in the manner so required for banking companies and other circulars issued by the Reserve Bank of India from time to time;
- The Bank has maintained proper books of account as required by law insofar as appears from our examination of these books;
- The returns received from branches of the Bank have been found adequate for the audit; and
- The transactions that came to our notice are within the powers of the Bank.

Beyond Growth and Globalisation

Richard B Norgaard

The early critique of undifferentiated, undirected growth, emerging from the north as well as the south, has been diluted over the years. The idea of 'sustainable development' co-opted social and environmental agendas into a mainstream now geared to market liberalisation and globalisation. It is time to reassess and join forces in a new critique of growth, and redefine progress.

THE idea of human progress dates back thousands of years in western thought. People of all cultures have held ideals they hoped they would meet. Economic growth, on the other hand, is a very recent human preoccupation. Its arrival had to await the development of an indicator, the measure of gross national product. Its spread across the globe awaited the concept of economic development and the establishment of development agencies. Thus, as an obsession institutionalised in numbers and agencies, growth is younger than I am.

After second world war, we began to meld a variety of endeavours – our concerns with material well being, economic stability, reducing inequity within and between nations, and even world peace – into a single fixation. To some extent, economic growth does intersect each of these separate concerns, hence its bonding nature. However, soon after we began to meld these concerns, what had started with at least a modicum of real, direct interest in human progress transformed into a GNP growth race between two economic systems. I remember October 1957, going out with thousands of other people into the hills surrounding San Francisco Bay to huddle beneath spots of dark sky where we could get a glimpse of Sputnik. My first economics professor at Berkeley carefully explained how the US economy was growing at less than 4 percent per year while the Soviet Union's economy was growing at more than 8 percent per year. I can still see the growth curves on the blackboard. Even though we were more than twice as rich at the starting point, the Soviets would surpass us in 15 years. I can recall posters on city buses showing Nikita Khrushchev holding a shovel and saying 'we will bury you'. And the crossing growth curves and the specter of Khrushchev framed president Kennedy's speeches urging us to

prove that our system could out-perform theirs. A quarter century of growth mania followed.

Undifferentiated, undirected economic growth soon had its critics from the industrial north, most notably E J Mishan, Nicholas Georgescu-Roegen, E F Schumacher, Dana and Dennis Meadows, and Herman Daly. Similarly, development programmes stressing economic growth over human well being, also had their critics in the south. From Gandhi through Mahbub ul Haq and continuing to this day, voices of concern and dissent from south Asia have been especially important. The questioners of undifferentiated economic growth, north and south, are among the founding fathers of ecological economics, a movement I have the honour to temporarily head. More importantly, the critique of growth on social and environmental grounds stirred sufficient controversy that those behind growth eventually suggested a compact. Thus the idea of sustainable development was institutionalised a little over a decade ago. That compromise has been extremely influential in bringing different interests together in search of a new course. But the river of history had other currents swelling, and that compact is now only a swirl in a yet larger, new mainstream.

Sustainable development will never emerge the same. We are now in a different course of economic history. With the collapse of the former Soviet Union, many proclaimed the victory of the market model, indeed zealots proclaimed the triumph of a pure form that never existed in practice. Thus the push for yet faster growth through ever stronger reliance on markets. While economic growth is still the dominant rationalisation given for globalisation, we increasingly hear that each country must be ever more competitive simply to stay in the race. Countries

must adapt new technologies, train workers continuously, and provide institutional environments for domestic and foreign capital. If they do not, they will fall out of the race. With only a little imagination, we can see nations like tired mice tumbling off a treadmill that whirs on under the power of the yet still vigorous. President Clinton expressed this clearly in his speech of September 14 on the global economy with respect to what expectations Russians should have:

No nation, rich or poor, democratic or authoritarian, can escape the fundamental economic imperatives of the global market...

At least economic growth both promised more of some thing that conceivably could have been good and did not threaten dire consequences should a nation choose to slow down or take its own course. Now, simply keeping our economies going faster and faster has become an end in itself. And what growing economies might provide for us is secondary, if addressed at all. Thus it is time to confront economic growth anew and to address globalisation as well. Sustainable development may never emerge the same, but sustained critique may yet bring us closer to our senses.

This lecture contributes to the critical chorus. This is an appropriate time and place first to document how far we have veered from a reasonable course, second to ask how current myths that have co-evolved with current economic thinking have kept us from distinguishing between growth, globalisation, and human progress, and third to suggest how we might get back on a path, or many paths, of progress.

Obviously I am speaking from my own station in life, as a rich, formally educated westerner. Optimists among my culture, class, and age group argue that much progress has occurred in our lifetimes. They point out that more people are living better than ever before. Rich and poor eat a greater variety of food, live longer through improved medical technologies, and enjoy material comforts and forms of entertainment never before imagined. New agricultural knowledge, inputs, and practices have staved off the mass famines repeatedly predicted in our youth, and we are moving into a bright new era of biological engineering. Authoritarian governance is waning. Global exchange has

been democratised by electronic media, inexpensive air travel, and the rise of both transnational corporations and a rich network of non-governmental organisations. Of course, even optimists concede that these brief words are too simple and glowing. To realistically elaborate on the exciting, positive developments would require the rest of this lecture, and I assure you I could do it without drifting into hyperbole.

Nevertheless, I still think the whole economic project needs re-directing. Again, I cannot speak for the great masses of people whose hopes are whittled far in excess of what they receive. Empathy does not confer authority to be their voice. I can only speak from the world I know, acknowledging not only that my understanding is that of a privileged academic but also that my understanding has been greatly enriched through extensive personal and professional associations facilitated by modern global developments. With these caveats made clear, I will speak freely.

WHY UNDIFFERENTIATED GROWTH AND GLOBALISATION ARE NOT PROGRESS

One of the basic reasons growth and globalisation are not leading to progress is because there are no linkages, no feedbacks, between current changes and what can continue on into the future. There is nothing to assure that the past half century has not simply been a 'feeding frenzy', like a delirious swarm of piranha attacking a bloodied victim. We cannot foresee all possibilities for the future, but we can maintain perspective by questioning history in the context of how natural science helps us understand global capacities and hence sustainability. As is the convention in such approaches, I will start with population.

The world's population was probably a little over a quarter billion people 2,000 years ago. Population doubled over the next 1,600 years or so reaching half a billion. The doubling time shortened dramatically to about 200 years, and then to 100 years, putting us at about 2 billion people at the turn of this century, after which the doubling time shortened again to about 60 years. The doubling times have begun to lengthen again, perhaps to 100 years, perhaps longer, with the uncertainty in the net effect of rapidly changing birth and death rates. With a base of 6 billion people, the absolute number of additional people each year continues to soar. The planet has not gotten any bigger. We must keep asking ourselves, 'how dense can people be?'

Yes, I know I should not speak of population without speaking of consumption and inequality. I am coming to these. And yes, I hope I will be among the many who have already died before their Malthusian concerns prove true in the universal sense that such concerns are typically asserted. But I also know that it is irresponsible to dismiss population as a factor both in the total picture and in its many parts.

Global consumption has increased six-fold since 1950. This increase is fully reflected in material and energy flows. Oil use increased more than seven-fold, from 451 million tonnes per year in 1950 to about 3,500 million tonnes now. Natural gas use increased twelve-fold, from 190 to about 2,300 million tonnes of oil equivalent. Even coal use has increased faster than population.

Energy use and material flows are simple prior indicators of environmental impacts. To be sure, the actual relationships are extremely complicated. Fossil energy used to produce fertiliser to intensify agricultural production increases groundwater pollution, but it also reduces the rate of extending agriculture onto marginal lands that harbour the remaining natural biological diversity. Many renewable energy sources also have environmental impacts. Nothing, of course, is really simple. But we also need to admit that it is absurd to try to define sustainable development in case specific terms when the problem is systemic and the system is continually re-configuring. Thus I have come to the conclusion that crude indicators like total population and material and energy flows are the best we have at the macro level.

This consumption is highly unequal and getting worse. Globally, 86 per cent of private goods are consumed by the richest 20 per cent of the population while the poorest 20 per cent consume only 1.3 per cent. This means that the top 20 per cent consume approximately 66 times as much in private goods per capita as the lowest 20 per cent. The US with 5 per cent of the world's population consumes 25 per cent of the world's oil. Nor will the poor ever catch up for within and between most nations inequality is growing and in a considerable number of nations, there are significant groups whose absolute consumption is decreasing.

The consumption statistics are from the recently released *Human Development Report 1998* (HDR 1998). Since the poor presumably consume a greater portion of private goods that are not traded in

markets, the extremes are not quite as great as this. On the other hand, imagine what the ratios look like when the top and bottom 10 per cent or 5 per cent are compared. And while the extremes for income are immense, the extremes in who holds how much wealth are far greater still.

The 1998 HDR argues that Americans spend more on advertising and Europeans on ice cream in a single year than is needed to provide basic education and sanitation to the third of the global population who need schooling and toilets. Of course, we would not want American advertisers running schools in developing countries more than they do now. Nor is it clear that European ice cream makers could do the plumbing. Still, given how well we have trained people to switch careers in the new global economy, at least the lag times for reaching social goals were we to try should be lower.

While numerous measures have been taken to manage the environment and some environmental conditions have clearly improved, new problems keep arising and our understanding of problems is increasing faster than we are responding. Current rates of bio-diversity loss, the appearance of climate change and threat of its acceleration, and the accumulation of toxics in the environment provide ample evidence that we are living on our children's natural inheritance.

Considerable economic and ecological thought has gone into how we can measure the importance of the services of our climate system, of our ecological systems, and of biodiversity as a part of our natural inheritance. New indicators are being derived to help us achieve sustainability. A comparable effort has gone into thinking about mechanisms for achieving environmental goals. While I support all of these efforts, I am concerned about the naivete of using the marginal approach of neo-classical economics to derive utilitarian values and control mechanisms for a system that is clearly not close to the path we want it to be on. Even if we included every possible interaction within the market system so that it worked perfectly efficiently, we would still have to grapple with what distribution of rights will get the system to go where we want it to go. My fear is that insights and mechanisms rooted in efficiency analyses will be accepted as sufficient given the dominant ideology when in fact that ideology largely serves the purpose of protecting the current distribution of rights. A significant move toward an ethics of care for

people and stewardship of nature is sorely needed.

The combination of excessively high consumption among the rich and growing inequality both drives environmental problems and makes us incapable of effectively responding to them. This problem is exacerbated by the rise of market ideology, further reducing our ability to make decisions together.

The rich are so physically and socially removed from most of the social and environmental impacts of their consumption that they have difficulty seeing it, let alone responding to it. The 'distance' between rich people living modern lifestyles and between them and the poor is also driven by knowledge and experiential specialisation that limits the ability of the specialised to perceive the whole and learn together. Many among the poor, on the other hand, are likely to be closer to the land and a viable local community, but they are also more likely to be too poor to contribute to social sustainability and must degrade the land to feed their children and elders today. While the environmental crisis has always been a crisis for society in that society must change, it is important to understand that environmental problems arise due to deficiencies in our abilities to collectively perceive, learn, and act and these same deficiencies that drive the problem hinder us as we try to overcome it. Thus our primary difficulty is one of getting out of the circle we are in.

To too great an extent, technological change has simply helped us live on our children's natural and social inheritance faster rather than helped us live with nature and each other better.

Historically, social systems co-evolved with natural systems. For the past 150 years, we have been co-evolving around fossil hydrocarbons, not natural systems. Fossil hydrocarbons continue to drive a wedge between us and the environment, allowing us to co-evolve forms of social organisation, technologies, and values around fossil fuels rather than co-evolve with our environment. We need to think much more systemically about where different technologies are likely to take us over the longer term.

Even while we share in experiencing a globalisation of our material lives and the triumph of the market over the nation-state, these homogenising economic forces are proceeding in a manner that tolerates an increase in cultural diversity within and between nations. Cultural understanding,

respect, and tolerance, as well as common standards of what should not be respected or tolerated, however, are not sufficient to sustain peace.

Peace is a minimal requirement for fulfilling human potential, maintaining human dignity, building sustainable communities, and thereby achieving environmental sustainability. Under the myth of progress through modernisation, we thought the cultural differences which seemed to underlie war would be reduced. The French would still prefer to use more butter, the Thai more interesting spices, but all were imagined to be living comfortably together through the spread of scientific rationality and the use of the best technologies and ways of organising. Economic growth offered a similar promise of reducing differences. And now we are being told that global inter-dependence is the best way to reduce conflicts.

The record is clearly otherwise. The worst wars have been among the richest people with surprisingly similar cultures and considerable economic inter-dependence. War has not ceased with modernisation or economic growth or economic inter-connectedness, and human atrocities extend down through all income levels to the lowest. Clearly the facts do not support the myth. Nevertheless, the myth of a universal human nature to which all cultures would merge and framed how we thought about each other, was central to our expectations for the world, and affected how we responded to conflicts. As cultural diversification continues within countries and whole countries set out on their own paths, what might we share that could at least provide the hope of peace?

These problems are not simply looming in our future. Though our descendants will certainly bear the greatest burden of our inaction today, most of these problems are seriously hindering the fulfilment of human potential now. Yet it appears, at least to me, that we are largely in a state of denial. It is to this that I would like to turn.

SHARED MYTHS SUSTAINING OUR DENIAL

Our social denial and inaction are facilitated by a set of broadly shared myths. I am using the term 'myth' here simply as the ideas and concepts that give coherence to the many separate details with which we cope in our personal and political lives. Myths give wholeness to a whole we cannot really know. Myths influence our collective behaviour when they are shared by a wide spectrum of people, allowing them

to comprehend and act, or not, together. I will give special emphasis to how shared myths have co-evolved with economic thinking.

It is immoral to hurt peasants to save the forest: Recently a journalist, interviewing me defended the 'present orientation' of conventional economists with the argument that "when you have to choose between peasants trying to subsist in the Amazon and saving the rainforest against the ravages of economic growth, any reasonably compassionate person will defend the right of peasants to continue farming, of growth being allowed to proceed." This deep moral dilemma is often posed by conventional economists to their more environmental colleagues. We are presented with even more heart wrenching trade-offs here in India where protected elephants trammel unprotected villages and rare Bengal tigers prey on common young children and old ladies.

Over the decades, I have had to address again and again this juxtaposition of the poor today versus reasonable hopes for the future of all. Initially, I accepted the sincerity of those posing the dilemma, not infrequently fellow economists, and certainly from both the political right and the left. In the last decade, however, I have realised that the dilemma is symptomatic of a larger problem, how economics and public discourse have co-evolved in a particularly intellectually dishonest and morally vacuous way. Now I ask why the choice is between the peasant and the forest that our descendants might need. Where are the people driving the BMWs today, or even those driving Fords, in this myth? Why is it that we have these debates between rich environmentalists and rich developmentalists over moral dilemmas where the rich themselves are absent?

The first answer, and one that pervades the second, is that the powerful have more influence over which myths are repeated and become dominant than do the weak. The second, is that this dominance is also reflected in the history of economics from where it now feeds back on public discourse. As economists assumed power in government, they had to rationalise when economic theory allowed them to make recommendations on the behalf of the public directly, without resort to the moral discourse and politics represented by the social welfare function of their theory. Recommendations were justified if they were 'Pareto optimal', i.e., if they could be shown to benefit some without hurting anyone. From here, economists slipped

into an imaginary world filled with such win-win choices. Economies were either imagined to be so far from their efficiency frontier that the vast majority of possible moves met the Pareto optimal criteria or they imagined economies to be growing such that all could gain soon. Either way, economists did not have to present legislators or the public at large with the range of non-Pareto optimal moves over which moral struggle and political debate would surely ensue.

My own research with Richard Howarth has shown that sustainability is a matter of intergenerational equity, not efficiency. While none have challenged our formal model, many economists have been disturbed by our repeatedly pointing out that moral decisions must be made, that sustainability is not about Pareto optimality.

And so I am arguing that these peasant-forest, village elephant, tiger-child dilemmas stymie us because economists and non-economists alike have grown dependent on those so-called win-win solutions. Without them, economists, legislators, and the public simply fold their cards and give up. In short, I now see the presentation of these dilemmas as part of protecting the status quo.

You have to be rich to appreciate the environment: This commonly told myth was elegantly introduced only days ago into a class discussion. While living in China, a graduate student learned to her surprise that the Chinese were not interested in environmental quality. She convincingly argued that this was because they thought first of having food in their bellies and a roof over their heads. Furthermore, now they were aware of a wealth of consumer durables they wanted to buy. Until something well beyond basic needs were met, the quality of the environment would surely decay. This widely accepted myth has been around for a long time. The only surprising thing is that it took until the 1990s for econometricians to encode the myth into an environmental Kuznets curve.

The myth reigns in spite of the fact that the rich nations cause the vast majority of pollution. Never mind the fact that an American farmer contracts tilling and harvesting out to a specialist who drives a tractor with eight foot diameter tires from an air conditioned cab listening to a stereo system to produce food for consumers even far more distant from the land. Most of the respectable rich people have for the land descends from ancestors far poorer than we are. Again, I cannot speak for the poor, but respect for the land

figures heavily in survival and hence can be found in the cultural heritage of all peoples.

Nevertheless, the myth is propagated by both rich and poor alike. It allows the rich to be complacent in the knowledge that they have environmental controls that developing countries do not have. It allows the poor to defer what responsibility they do have for the environment until economic growth has come.

If capitalist economies do not grow, they will crash: The myth that we have no choice but to grow, hence there is little hope for the environment, is invoked by business page editors, frustrated environmentalists, and green Marxists ever ready to bash capitalism. While there are antecedents in the works of many economists trying to explain business cycles, many economists think the Harrod-Domar model that arose in the late 1940s proves the case for steady growth. It is, important, however, to keep in mind that the Harrod-Domar model is just a model, the most simple model that is still capable of demonstrating a relationship between savings, investment, and growth. The amazing thing about the model is that it has no actors or institutions whatsoever, and so is just as applicable to socialist or communist economies as to capitalist. Further, if I am not mistaken, the parameters can be set so that the economy runs at zero growth, or even a negative rate of growth, with the same unstable properties as when it is set for a positive rate of growth. Thus, what the model illustrates in a very simple way is not that economies have to grow but how changes in savings and investment rates might make them unstable.

There are other myths which sustain denial with which economics has co-evolved. One is the myth that agriculture and resources make up a smaller and smaller portion of GDP as economies mature, and therefore become less and less important. Another is that human capital can be substituted for natural capital continuously, until there is only a grain of sand left. These myths have been dealt with very effectively by Herman Daly and other ecological economists, so I will move on to the most important myth of our times.

The gains from reducing government expenditures and expanding trade justify social and environmental losses: Now, I am going to be really heretical in an age of government down-sizing and globalisation driven by neo-liberalism. For two centuries, the logic of exchange, Adam Smith's great discovery, has been used to

promote free exchange by individuals and corporations, unfettered by the complications of interactions with government. The logic is simply that *when two parties who are free to choose actually choose to enter into an exchange, it is because the exchange makes each party better off.* This logic is impeccable, but economists early deduced from the logic and have long intoned that *therefore governments should not restrict opportunities for people to make themselves better off through exchange.* It is this second step that does not logically follow.

The logic of exchange itself is faultless under the assumption that both parties are fully informed and utility maximisers. But the political agenda of free markets for individuals and corporations unfettered by regulations, taxes or trade controls imposed through collective choice does not logically follow, even if there are no effects on third parties. The problem, quite simply, is that the logic of exchange is indifferent to how the parties conducting an exchange are defined. It is true whether the parties are individuals, communities, bio-regions, or nations. If it is true for nations, why should nations not be 'free to choose' including being free to choose to affect the choices of individuals and corporations through taxes or trade controls? Some criterion beyond economics is needed to determine which parties should be free to choose under different circumstances.

While we might applaud the political agenda of Adam Smith to cast doubt on mercantilism, the agenda of those furthering this argument pretty much since has been to empower individuals and corporations and restrain collective action through government. The current arguments against government and for globalisation are an especially viral form of the myth of exchange. The policy problem remains one of deciding when individuals, groups, communities, or the state should be entrusted with decision-making authority, the central issue of political economy for millennia.

GUIDELINES FOR GETTING BEYOND GROWTH AND GLOBALISATION

Even while the dominant myths and understandings driving our economy appear to be firmly in control, the outcomes are increasingly indefensible and contention is increasing. Hence, the potential for change is great. I see a new world view developing from the global experiences and environmental discourses of past decades. It includes new basic

assumptions about the world, about desirable ends, and is pragmatic about the means for reaching ends. The following guidelines are key to challenging undifferentiated and undirected growth and globalisation:

Economic systems exist to provide for people, not *vice versa*. Markets should be tuned to reach socially determined ends and not promoted *per se*. The scope of markets should match the scope of effective governance. The gains to capital from globalisation must not be at the expense of communities and effective governance. Economic justice is as important as individual economic freedom. Economic freedom should not be pursued to the detriment of other freedoms.

Economic systems should complement, not override or commoditise, the non-material dimensions of social systems. Natural capital must be sustained. Renewable resource systems must be managed well away from key thresholds to avoid the collapse of critical services and ecosystem support functions. Material resources should be used effectively and recycled. The depletion of stock energy sources, undertaken within the limits of climate system concerns, must be offset by investments in new renewable energy technologies.

Human capital must be sustained. Communities, like renewable resource systems, must be maintained to provide critical services including community support functions.

There are limits to the substitution of human for natural capital.

Environmental and social sustainability is easier with fewer people.

The precautionary principle must continue to replace the historic *de facto* rule that "environmental and social change is 'innocent until proven guilty'". The shift from the scientific arrogance that marked the beginning of this century toward the humility of the present must not be offset by a new arrogance of multinational corporations and global capital.

I would like to be able to elaborate on what our goals should be. Frankly, while I have some idea of my own, new visions are still insufficiently discussed in the academic company I too frequently keep. The utopia literature of the 19th century was pretty much replaced during the past half century by simple growth worship offset by little more than cynical portrayals of a future to which we could only acquiesce. Now I sense an increasing interest again in thinking about the kind of future we want to have. While we have not seen a new wave of utopia literature

comparable to that in the late 19th century, there are more journal articles discussing communities that are doing things better. Breakthroughs in biological technology are begging us to learn from what earlier scientific breakthroughs promised and wrought. And cultural re-diversification is forcing us to acknowledge our desire for community and continuity.

With this redefining of progress only beginning to occur and with considerable variation in paths likely forthcoming, it is very difficult to generalise about alternative futures. Nevertheless, the diversity of ends and new world view themselves require us to seek a plurality of means. While retaining the advantages of expertise, the emphasis must shift toward multiple indicators, synthesis through communication and shared learning, and the use of discursive democracy to resolve action in the face of contradictory information and uncertainty. As an alternative to simply forging ahead with growth and globalisation, we need to move toward the use of the following means:

Improved information systems. Environmental impact assessment, environmental valuation and accounting, and new geographical techniques for organising information are contributing to this end, but much more is needed. Improved aggregate social and environmental indicators are needed such as those contained in the HDR; bio-physical indicators such as the 'ecological footprint' approach; environmental valuation, environmental accounts, and greening of the GDP.

Improved communication and learning systems are needed. The pursuit of specialised knowledge must be balanced with inquiry across specialities and formal and experiential training in trans-speciality communication. Ecological economics is an example of such an effort and many more are needed.

Adaptive social and environmental management needs to be used much more. By initiating multiple, deliberately diversified, smaller projects that are continuously monitored as real world laboratory experiments, we will be in a better position to adjust our course. Large projects with irreversible impacts should be avoided. The separation between science and management should be reduced through adaptive management practices.

Technological paths need to be debated early and openly so that their social and environmental implications can be foreseen and managed democratically.

Property rights, regulations, and taxes need to be redefined to favour social and environmental sustainability. Many institu-

tions determine our current course, no one type of economic institution, for example such as 'green taxes', can be modified sufficiently to set us on a new course. Improved, shared environmental and social understanding, combined with the development of social mores, are needed to complement the effectiveness of property rights and economic mechanisms. Specifically, and initially in the industrialised countries, we need to select technologies, define systems of property and incentives, and develop understanding and mores to rapidly reduce energy and material use. Rather than continually and incompletely assessing the impacts of individual projects and debate over the meaning of sustainable development, energy and material use need to be seen *a priori* as driving forces in environmental and social disruption.

We need to strengthen social mechanisms, and develop new mechanisms, that reinforce nonmaterial values so that they work as well as economic systems have worked to reinforce material values.

The national, regional, and international institutions that have centrally directed development need to be transformed into facilitative agencies.

Going beyond undifferentiated and undirected growth and globalisation will require both the north as well as the south taking action. Obviously, the call for rapid dematerialisation applies more to the north and there are great differences between countries, and so these guidelines are not equally appropriate for all. These differences also offer the opportunity for each country to help others and to learn from others.

The early critique of undifferentiated, undirected growth had a significant impact, but that impact has been diluted over the years. In retrospect, the 'sustainable development compromise' co-opted important social and environmental agendas into a mainstream that was subsequently too easily overwhelmed when it converged with the tributaries – I must say surprisingly large tributaries, of market liberalisation and globalisation. It is time to reassess and join forces in a new critique of growth and now globalisation as well. We must incorporate what we have learned over the past quarter century, we must address the new myths that stymie constructive action, and we must assert when and for whom growth and globalisation are appropriate and push for de-materialisation and community otherwise.

[This is a textual version of the 10th V T Krishnamachari Lecture delivered by the author at the Institute of Economic Growth, Delhi, September 25, 1998]

Water Management in India, China and Japan

Niranjan Pant

Water Resource Management: Institutions and Irrigation Development in India by A Vaidyanathan; Oxford University Press, New Delhi, 1999; pp xi + 271.

THE title of the book is a bit misleading as it diverges from the actual contents of the book. The book is not mainly about India as nearly half the book covers irrigation management in China and Japan. The book consists of four chapters. The first and fourth chapters are based on author's research as a visiting research fellow at the Institute of Developing Economies, Tokyo in 1982. While the first chapter deals with irrigation institutions in China, Japan and India, the fourth chapter deals with the same subject in respect of China in a more comprehensive fashion. The second and the third chapters cover India.

Starting the first chapter with the two opposite theoretical propositions centring on centralised/decentralised authority structure for irrigation management, the author finds useful some of the studies emanating from this debate. Accordingly, he advocates the necessity of comparative studies of water control institutions in different agro-climatic regions and countries for a better understanding of the phenomena.

The chapter covers relations between water control and agricultural production, role of irrigation institutions in acquisition, conveyance and distribution of water, including system maintenance and its sustainability. Since the chapter is based on his earlier research in Japan, China and India, the comparative illustrations are drawn from these countries. Based on some illustrative comparisons, the author suggests that the nature of water control necessary for efficient agriculture as well as the kinds of works that are feasible in a given situation are, in effect, conditioned by a variety of factors such as rainfall, temperature, topography, physical environment, the scale of water control structure, the design, the cost, the stakes of concerned parties.

The central argument of this chapter is that a proper understanding of the form and effectiveness of irrigation organisations requires that their structure and

functioning be viewed in the context of agro-climatic, technological and socio-economic environment in which they operate. However, caution needs to be observed while generalisations are made on a comparative basis. For instance, the author's observations that in China water users' contribution in terms of the cost of construction and subsequently their role in the management is quite extensive compared to users' negligible role in India (p 10, pp 25-26) needs to be appreciated in the fuller context, where a variety of intervening factors are at work. Those that are important in the Chinese context are mobilisation of corvée labour, existence of small surface systems, role of the party cadre in a totalitarian communist regime, etc. In pre-independence India also, users' role in construction and management was no less impressive whether one is examining the small tank systems of south India or indigenous irrigation systems such as *ahar-pynes* of south Bihar (Niranjan Pant, 'Indigenous Irrigation in South Bihar: A Case of Congruence of Boundaries', *Economic and Political Weekly*, December 5, 1998, pp 3132-38). This was mainly due to the existence of feudal or colonial centralised regimes, which has been an all-pervading feature of China.

The second chapter reviews the salient features of India's irrigation development during 1950-90, the problems that have emerged, the responses such problems have evoked and the reasons for failure to eliminate these problems.

The author is of the view that Indian plans have accorded high priority to irrigation sector and consequently massive investments have been made in this sector. As a result, irrigation facilities have made a major contribution to sustaining agricultural growth during the past five decades. At the same time the performance of irrigation sector, particularly that of public sector, has not matched the expectations both in terms of pace of development and use of facilities and their

impact on productivity of land. He lists a number of problems which have arisen during 1950-90. The ones highlighted by him are inordinate delays in completion and cost escalation of large surface projects, underutilisation of their irrigation potential, unsatisfactory quality of irrigation, low cost recovery and sustainability of such projects. In addition, there are problems which have led to ecological and environmental degradation on account of waterlogging caused by major and medium surface projects, and problems of salinity and groundwater saturation on account of its excessive extraction.

A very pertinent issue raised and examined by the author relates to major divergence in the data relating to 'area irrigated' emanating from the Planning Commission and the Land Use Statistics (LUS). As per plan documents, between 1950-51 and 1993-94, gross irrigated area in the country as a whole increased by around 53 m ha, while LUS estimates an increase of 45 m ha. The author has gone in considerable details to pinpoint the shortcomings of the procedures adopted and the reasons for variations (pp 58-63). Another area where wide variations in estimates have been highlighted by the author relates to state-wise estimates of waterlogging arrived at by different agencies. At the all-India level in 1990 the Central Water Commission (CWC) estimated waterlogging to the extent of 1.61 m ha, while the ministry of agriculture's estimate during the same year was 8.52 m ha, which is more than five times estimated by the CWC (p 104).

Similarly, the issue of irrigation potential and its utilisation has been examined to highlight the pitfalls arising on account of faulty estimates of 'potential created'. The author rightly observes that part of the problem lies in ambiguities in definition of 'potential' as well as differing interpretation of guidelines. Further, estimates of potential gross irrigated area are based on a number of assumptions which do not hold once actual irrigation starts (pp 63-65).

An important development during mid-1970s resulting on account of utilisation of irrigation potential from large surface projects was the initiation of CAD programme. It was a centrally-sponsored programme which provided large amounts of funds for on-farm development works. Although huge funds were spent under the programme, the programme was never

evaluated in terms of its impact of water utilisation. The most comprehensive studies available relate to the organisational aspects and the constraints on the implementation of certain categories of physical improvements in the system (p 94).

The reviewer of this book had found execution of on-farm development works under the CAD programme in 1981 in Bihar virtually of no use despite the fact that a good amount of money was spent on these works. Again in doing a micro level detailed study in 1986-87 of one minor in Sharda Sahayak project in Uttar Pradesh, the reviewer found that the impact of on-farm development works in increasing the irrigated area was marginal (Niranjan Pant, 'Utilisation of Canal Water below the Outlet in Kosi Irrigation Project: Administrative and Community Level Solutions', *Economic and Political Weekly*, September 26, 1981). It was further found that the money spent on these works did not necessarily lead to increase in irrigated area (Niranjan Pant, *Irrigation and Agricultural Development in a CADA*, Ashish Publishing House, New Delhi, 1992, pp 51-54). This being the case, even

today there is an urgent need of evaluation of the impact of CAD programme in enhancing the irrigated area in respect of some of the selected projects drawn from different states, more particularly from UP and Bihar.

The third chapter entitled 'Aspects of Institutional Reform in Irrigation' focuses on institutional failures. The author's emphasis on institutions is due to his contention that institutional deficiencies are the root causes of many of the problems and that restructuring the management structure is a sine qua non for tackling such problems. He goes on to spell out the directions of reform in three key areas: (a) planning and operation of large surface systems, (b) rehabilitation and expansion of local irrigation works to benefit rain-fed agriculture through integrated watershed development, and (c) regulation of groundwater. The crux of his argument is that solutions in respect of reforms area no doubt require more and better technology for a holistic approach to the problems. Yet technology alone is not enough and the effectiveness with which technology is used and its impact depends crucially on the way

irrigation systems are structured and managed.

In respect of the first area of reform, the following suggestions of the author are very useful and deserve serious consideration. Integrated planning for harnessing water from all sources (rainfall, streamflow, and groundwater), and to ensure optimal allocations between different uses and users is a technically demanding task and needs to be accorded high priority. A substantially larger and better-organised effort to broaden and deepen the database is essential. Irrigation engineers need to interact more with agricultural and social scientists. Water resource planning has to be much more open and sensitive to the social and environmental impact of the projects (pp 126-31).

While discussing the issue of user participation in irrigation management (pp 131-39), the author has mixed up government policy and efforts of past with those of the present. Starting from the mid- 1970s until late 1980s, government policy was to encourage user participation below the outlet level (about 40 ha). There was a shift in government policy over the

COLONIALISM, TRADITION AND REFORM

An Analysis of Gandhi's Political Discourse
BHIKHU PAREKH

Praise for the first edition:

Bhikhu Parekh's excellent book sets out Gandhi's main ideas in a clear and cogent form.

Political Studies

It is not often these days that good new works relating to the thought of M K Gandhi cross one's desk. Bhikhu Parekh's excellent volume is a welcome exception.

Australian Journal of Politics and History

This revised edition includes a new chapter, takes note of the more recent works on Gandhi, and draws in the author's own deeper understanding of Gandhi today.

1999 • 360 pages

Rs 475 (cloth) • Rs 295 (paper)

REVISED EDITION!

GANDHI'S VISION AND VALUES

The Moral Quest for Change in Indian Agriculture
VIVEK PINTO

Pinto...demonstrates that even in a macro political economy gone awry, village communities can still construct for themselves meaningful and productive lives—so long as they can follow self-restraint, treat both the 'other' and nature with respect, and marry ethics to economics. In doing so they live an alternative.

Seminar

The author of the book deserves to be congratulated for his inspiring and thought-provoking work which is well written with proper referencing.... A vivid explanation of [Gandhi's] experiments by the author is enriching.

years and at present user involvement, particularly by the government of India is advocated at the minor/distributory level commanding 300-1,000 ha (above the outlet). It is because of this confusion that the author quotes conditions for the success of user involvement below the outlet, while the conditions actually refer to water user groups above the outlet (p 137).

In respect of the second area of reform, the author advocates *in situ* moisture conservation through integrated watershed development. This, he thinks, is necessary to check erosion, restore the vegetative cover in the upper reaches and remove impediments to the free flow of water into the tanks. In due course of time, such measures lead to better utilisation of rainwater for irrigation instead of the same being wasted.

In examining the subject, the author recounts various government and donor efforts during plan periods and the efforts made by the NGOs in this venture. He stresses the importance of a database for planning the watershed development. In the execution of the programme, the right mix of measures and proper design of each is advocated. In assessing the utility, emphasis is laid on the need for much closer scrutiny of costs in relation to expected benefits. In respect of organisation and management of the programme, stress is laid on community participation and how to go about it.

There are some who think looking at water from a narrow angle is not conducive to irrigation reforms. It is felt that reform initiatives like participatory irrigation management need to be made part of broader efforts at integrated water resources management and rural development to be able to address farmers' overall needs. Such an approach envisages greater integration between the measures of irrigation development and watershed development (Peter P Mollinga, 'The Policy Process in Irrigation Reform: Technology, Rural Development and Politics', paper presented in the fourth international INPIM in Bali, Indonesia, July 14-20, 1998, p 14).

The third area of reform dealt with in the chapter relates to regulation of groundwater sustainability. On account of historical antecedents, comparatively smaller investment requirements, easy manageability and government encouragement and support to the farmers, groundwater development has witnessed a phenomenal increase in all parts of India. This has led to the twin problems of salinity and groundwater saturation. In the midst of such a scenario, two

opposite views have emerged. On the one hand, there are the water market proponents who argue in favour of its free use. On the other, there are regulation proponents who ask for strict control and enforcement of a legislation in this respect. The author suggests a number of steps to be taken by the government to regulate the excessive extraction of groundwater. While some of these relate to measures restricting government encouragement and subsidies to farmers, the others relate to regulating mechanisms. The author lays special emphasis on forcefully and continuously publicising emerging trends and their consequences in specific endangered areas by dramatising potential dangers in such areas.

The fourth and the last chapter examines the organisation and management of water control in China in a historical perspective. A postscript on post-1979 reforms has been added to the chapter based on papers presented in an international conference on irrigation management transfer held at Wuhan, China in September 1994.

The Chinese water control system is said to be both extensive and diverse in character. The total irrigated area is placed at 53 m ha. This constitutes 40 per cent of the total cultivated area. The system shows marked regional variations. However bulk of the Chinese system comprising of its small-localised projects continues to be planned and executed locally with local resources of labour and material. This has been so since ancient times. No doubt the basis of resource mobilisation has undergone changes—from corvée labour mobilised by feudal landed gentry to the one organised by the Communist Party and its cadres and ultimately to the present day contract management. The systems have evolved and grown by expansion and integration of older works earlier constructed.

According to the author, massive local resource mobilisation for water conservancy work was a hallmark of the 'Great Leap Forward' period. Problems and solutions relating to efficient management and cost recovery have been widely debated since the 1970s. The abolition of communes in favour of individual cultivation in the post-Mao period has created new problems in irrigation management. As a matter of fact, several of the problems of Chinese irrigation faced in the post-reform phase such as poor management, successive reliance on bureaucracy, inadequate cost recovery, and resistance to increase in water charges are not new as most of them existed in the pre-reform era.

The most important contribution of the chapter to the understanding of the development of irrigation institutions in India seems to be the derivation that the author has made on the basis of his study of China. The derivation is that the Chinese experience demonstrates that centralised user management does not by itself solve the problems of technology upgradation, integrated management and harmonious relations between users of water and its managers.

The collection of essays constituting the book, according to the author, draw on his research extending over two decades and seek to provide a more comprehensive holistic view of the problem of water resource management. Two of the essays dealing with India fully justify the statement of the author. Here his long and varied experience, deep understanding, wide knowledge and insightful judgment bring forth most vividly the true picture of Indian irrigation scenario in general and its institutional aspects in particular. While dealing with India, whether it relates to quality of data or with irrigation operations or even with integration of technical complexities and institutional realities, his understanding is most profound and his suggestion most pragmatic. However, when it comes to other two essays that cover Japan and China it is difficult to justify their inclusion in the present book. It appears as if some discrete pieces have been put together to force an integration and unity which apparently does not exist. The main reason for this misfit is that there are no comparable parameters referring to a similar timeframe. In case of China and Japan, most of the data and understanding are based on what the author collected in 1982. On the other hand, in case of India, author's understanding as well as the data are most recent.

Overall this book makes a very important contribution and a highly useful addition to the available literature dealing with Indian irrigation since independence.

Towards Federal Nation Building

Supriya R Kanetkar

Rethinking Indian Federalism edited by Rasheeduddin Khan; Indian Institute of Advanced Study, Shimla, 1997; pp 271, Rs 350.

"IN the 50th year of our sovereign existence as a modern state, it is critically significant for us to rethink our federal polity and plural society in order to design a federal India which can successfully combine 'federalism' and 'pluralism' in the institutional framework of 'self-rule plus shared-rule'," says Rasheeduddin Khan in his introduction to *Rethinking Indian Federalism*. The volume, edited by Khan, reflects upon the macro rubrics of Indian federalism in order to search for a new federal identity for building a more equipoised and co-operative federal polity with better centre-state relations.

The book has come at a juncture when Indian polity, society and economy are undergoing a sea change. The one party dominance of the Congress, both at the centre and in states has come to an end. A new era of coalition politics has begun with the regional parties at its centre stage. There is a greater demand for state autonomy. Assertive parochialism is gaining ground. On the economic front, India can no longer keep away from the 'globalisation' and 'market economy'. States are no longer waiting for the central assistance for their developmental projects but are directly negotiating with the global agencies like World Bank for aid and assistance. It is in this context that the present work assumes significance. It reflects upon the need to reconcile the twin process of political unification and social diversity.

Globally, federal idea and federal systems are acquiring relevance in our age. But federations in the last two centuries have exhibited a strong propensity for centralisation of power and decision making. India is no exception to that. Indian Constitution in fact describes India as a 'union of states' and is often described as 'federal' in nature and 'unitary' in spirit. Of course, the political and economic compulsions at the time of independence made it 'union type'. But today our five decades of experience of nation-state building indicates that the term 'federal' ought to include a large dimension of India's reality, not merely in terms of administrative reality but also in terms of

socio-economic reality. And therefore, Khan emphasises the need for evolving a new Indian identity reconstructed by its own vision and political courage. In his opinion the process of nation building will be counter-productive unless it is a 'federal' nation building, for India is not a nation in the traditional accepted sense of the term. It is a plural society and this plurality needs to be recognised. Federal India, therefore, has to include segments and diversities in its efforts of nation-state building.

The essays of T K Ooman, Harish Puri and Aijazuddin Ahmad have sought to examine the process of federal nation building in the context of socio-cultural pluralism. While rejecting most of the western hypotheses that poly-ethnic (multicultural) states eventually breaking into many mono-ethnic states, T K Ooman observes that there were several instances where numerous nations had never staked claim to separate sovereign statchood, though they had opted for separate administrative arrangements especially in the spheres of identity-maintenance within a federal system. In fact, pluralism is a value orientation to the fact of diversity. But whenever discrimination against ethnics either by the state or by the dominant nation in the context of economic opportunities, civil rights (human rights) and political privileges is made, the crisis begins. In this theoretical context, he also identifies the major problems of building a federal nation.

Various contributors while recapitulating the trends in the working of India's federal polity observe that the new era brought to surface the unitary trends – the foremost reason being the Congress dominance in the national and state politics and Nehru's dominating personality. During the late years Indira Gandhi's 'personalised politics' further resulted in centralisation of decision-making at various levels of governance. The institutions like Planning Commission and All India Civil Services, over the years, have only encroached upon the autonomy of the federal units. Increasingly governors too are acting as agents of the centre and are

playing partisan role in state politics, especially in a situation of hung parliament.

Arshi Khan observes that even the constitutional provision of Article 356 dealing with the breakdown of constitutional machinery in a state, too does not provide remedial measures to prevent its misuse. Moreover, the centre has overplayed this provision in order to serve its own political interests. Even when legally and constitutionally justified, the centre has rarely taken into account the Article 355 before making proclamation under Article 356. This has also made the role of governor critical and controversial. He remarks that in principle the factor of maintaining national unity and integrity should be reconciled with the imperatives of state's autonomy and Article 356 should be sparingly used, that too after exhausting the remedial measures available in other provisions of the Indian Constitution. Also it is the need of the hour to take a fresh look on the entire gamut of the issues and to make necessary amendments in the Constitution to prevent the misuse of Article 356 and to make the institution of governor a non-partisan and non-political one.

The Indian Constitution is a product of two conflicting cultures – one representing the national leaders' normative concern for India's unique personality and the other over-emphasising the concern for national unity, security, etc. And as a result, the founding fathers opted for a semi-hegemonic federal structure where the balance is in favour of the centre, says Amal Ray.

Despite the unitary characteristics and centralising tendencies, the Indian Constitution is yet a federal Constitution of its own kind. India is a diverse society with a fundamental unity. P R Dubhashi argues that India which has begun with the concept of 'co-operative federalism' has degenerated into a 'disintegrating federalism'. He emphasises the need to develop loyalty to the nation among citizens because without such loyalty to the Indian nation state, India cannot survive. The disintegration of Soviet Union, Yugoslavia, Czechoslovakia created fear in the minds of many Indians about a similar experience here. But both, Khan and P R Dubhashi reject such a situation. Khan points out that there is no denial of fragilities in the federal system but India is neither a multi-nationality state like USSR nor a multi-ethnic state like the US, it is a multi-regional

state. Dubhashi feels the unity of India is firmly based on geography and deeply rooted in history. And past experience clearly shows that though divided on the basis of caste, region, language, we as Indians have often stood united at the time of any external aggression. The common historical past and culture binds us together.

Apart from the centralising tendencies India's federal secular identity is being seriously threatened by politically militant, socially homogenising and culturally hegemonising assertive communal forces in recent years. Sunil Shastri critically examines the relevance of secularism to India's federal polity. Though secularism is one of the basic features of our Constitution, it is still less emphasised in the socio-economic and political culture of India. The strengthening of secular forces would not only include cosmetic legal changes but also initiating the fundamental changes at the social and political levels, says Shastri. In other words, secular order should be promoted from and by society itself. Strengthening secularism also involves enriching the content of Indian democracy. He also outlines the strategy for promotion of secularism.

Against this background, Kumar Suresh analyses the conceptual implications of hindutva in the process of federal nation building. The objective of hindutva, he says, is to impose upon the people of India a self-invented, monolithic, homogeneous and hegemonic Hindu identity. But he also expresses that conceptually hindutva is inherently limited, therefore its public appeal to Hindu nationalism would be short-lived phenomenon. In the course of the discussion, the relationship between caste, class and politics is also reflected upon. Caste and class constitute an important dimension of India's federal polity. In order to analyse the operational dynamics of politics, both caste and class factors must be taken into consideration. And thus, there is a need to evolve an alternative model in India where caste and class, two important realities of Indian society could be analysed within a single framework.

The formulations on these macro themes have been supplemented by certain micro-studies (caste studies), the problem of regionalism and demand for separate states have been discussed in the studies of Jharkhand movement and Uttar Pradesh. Ajay Kumar Singh observes that in more than one sense present-day Bihar is an

'imaginary state' as it consists of different socio-culturally distinct and geographically different regions of Mithila, Magadh and Jharkhand. Over the years, Jharkhand has emerged as a classic example of 'internal-colonialism' and cultural suppression by the people of other regions (mostly from north and central Bihar). Similarly, Uttar Pradesh is too large for its size, making it unmanageable for the administration to fulfil its administrative and developmental responsibilities. Rasheeduddin Khan emphasises the need for re-organising the existing states for creating a more federal balance and to avoid centralisation of political power. Unfortunately regionalism has always been looked upon as a negative phenomenon, detrimental to 'national unity' and 'integrity'. But with assimilation being proved facile, a new thinking of regionalism is required. Regionalism should be seen as a federal mechanism of organising society and polity that can accommodate the matrix model of 'self-rule with shared-rule'.

Most of the papers have been revised by their respective authors in the light of

discussions during the 'Study Week; organised at the Indian Institute of Advanced Study', Shimla. With certain variations apart, the papers have been arranged according to the themes of each session of the discussion. Though a minimum uniformity of style and format has been maintained, the reader may find a variation in the pattern of referencing of the authors. The individual style of the authors, too has been retained. This nonetheless disturbs a coherent reading of the book, but perhaps, justified as a matter of 'intellectual autonomy'.

Unlike the conventional reductionist approach to the study of 'federalism' that restricted federalism only to the legal formalism of distribution of power and authority between federal government and state/local/provincial governments, the emphasis here is on relevance of federalism to a plural society with a paradigmatic shift from mere statism to federal nation building with added emphasis on multi-disciplinary approach to the study of federalism. 'Rethinking Indian Federalism' is certainly enlightening and undoubtedly a book with a vision.

Ladies & Gentlemen,

On behalf of the Board of Directors and on my own behalf, I welcome you all today to this third Annual General Meeting of the Bank. As you must have seen from the Bank's Annual Report 1998-99, your Bank has posted an all round improvement in the performance in its various key parameters during the year under review. Amongst all nationalised banks, your Bank has recorded the highest net profit of Rs. 421.44 crore and the Board has proposed 30% Dividend for the year 1998-99. I am happy to inform that your Bank has adopted the global best practices by making prudential provisions, recommended by the Narasimham Committee-II, well ahead of the time schedule, which will go a long way in strengthening the financial fundamentals of the Bank. But I elaborate upon the Bank's performance, it will not be out of place to dwell upon the economic and banking environment that was prevailing abroad as well as in our country during the year under review.

Economic Scene

Close on the heels of the South East Asian economic crisis, the international financial markets were faced with the inclusion of Russia and the problem of Brazilian and Japanese economies, which saw the Stock Exchange indices throughout the world falling down. The year also witnessed some mergers and closures of the banking as well as non-banking companies across the globe involving a tighter regulatory framework. Issues of solvency and capital adequacy were debated in banking circles leading to tightening of global prudential standards. Your Bank though having its presence in a number of other countries, did not face any problem thanks to its good risk management practices and prudent accounting policies. But at the same time it was an opportunity to learn a few lessons in international banking.

Notwithstanding the recessionary trends affecting many parts of the world, the Indian economy displayed greater resilience during 1998-99. A strong GDP growth of 5.8% was mainly fuelled by the robust turn-out as well as a vibrant services sector. However, it is the industry and trade that generally feels the torments of financial institutions. The recessionary trends in steel, cement, textiles and automobiles had a cascading impact on many other industries having forward or backward linkages. The negative export growth resulted into a negligible rise in the non-banked business of commercial banks.

Compared to many other emerging market economies, India showed better stability and confidence, as reflected among other things, in the success of Resurgent India Bonds, the national endeavour to beat the economic sanctions. A total fund of Rs. 18,000 crore of non resident deposits was mobilised by the banking system. Besides, the volatility in the foreign exchange market was quite minimal. Now there are strong signs of recovery in the industrial economy of the country, propelled by a good monsoon, which I am sure will revive the demand for credit as well as pave the required boost to the equity market. The economy is expected to end up with a robust GDP growth of about 6 to 6.5 per cent.

Second Phase of Reforms

The banking environment was characterised by further doses of reforms. In the first phase of reforms, the focus was in accounting policies including income recognition, asset classification and provisioning norms, which aimed at bringing in a fair degree of transparency in the bank balance sheets.

In the second phase of reforms, the objective is to encourage banks to streamline their internal systems and procedures for achieving better operational efficiency. Certain banks including yours, have been given autonomy in certain areas

besides location of interest rates on deposits and advances. In the area of credit, banks are now given lot of freedom for assessing the requirements of bank finance, deciding the industry wise exposures within the overall ceilings of 35% & 50% for single party and group exposure respectively.

The recommendations of Narasimham Committee-II were also accepted by the Reserve Bank of India and accordingly banks are required

to maintain higher capital adequacy ratio of 9% from 31/03/2000. The asset classification and income recognition norms were tightened further to bring them closer to international standards. But apart from these measures, Indian banks are now oriented towards sophisticated tools of risk management and asset liability management. The focus is certainly shifted from mere growth to profitable growth, which your Bank had realised and internalised in the early nineties. The Reserve Bank of India's initiatives of widening and deepening of the money, debt and forex markets are welcome, though some hard measures of removing the systemic hurdles are badly needed. Adoption and implementation of new information technology and faster recycling of funds through better recovery are the two critical factors where the Indian public sector banks look to the regulations to get chipping hand.

Moreover, the Khan Committee recommendations on universal banking called for broadening the skill levels to enable banks to render a range of financial services through a single window. Keeping in view the growing aspirations of customers, your bank has been striving for speedy product innovation, product modification and better product delivery system with the help of technology. The entry of Internet banking and emergence of E-commerce indicates the road map of banking services in the new millennium. As a growing organisation committed to serve the customers efficiently, your Bank has been going up for the critical inputs identical to prepare the bank to measure up to this task. Your bank has been transforming such strategic vision with pro-active measures to achieve the corporate goals ahead of the system.

Notwithstanding the declining interest rate regime, your Bank has been able to maintain the net interest margin above 4 per cent. In fact the objective of lowering the PIR was to enable the economy to move on to low cost structure. But such initiatives of individual banks have to be supplemented with an improved recovery climate. If banks are able to bring down their net non-performing loans to international standards, this could greatly improve their ability to operate with even lower net interest margins. The recent initiative taken by Reserve Bank of India in preparing the guidelines for compromise/settlement, which are also adopted by our Board, is a welcome step. Further, the setting up of 12 DRTs, activation of BIFR and proposed legislation amendment for DRT/BIFR and other legal procedures for realisation of banks' securities will

go a long way in enabling the banks to improve the asset quality.

Performance of the Bank during 1998-99

Now let me give you financial details of your Bank's performance during 1998-99.

You will be happy to learn that your Bank is the only public sector bank to have implemented all the new prudential guidelines announced by Reserve Bank of India as a sequel to the recommendations of Narasimham Committee-II. Your Bank's capital adequacy far exceeds the revised ratio of 9% to be achieved by 31st March 2000 by a wide margin. Similarly, the Bank has

not possible. Many of the weak banks are on the verge of defaulting on 9% capital adequacy ratio as of 31.3.2000. The well managed banks were able to comply with the norms by tapping the long term debt or equity market. However there is a urgent need to remove the regulatory constraint if these banks have to have a free access to the private sources. Today, there is a constraint of minimum Govt. holding of 51%. Similarly the FI holding in the equity of banks including GDRs, ADRs cannot exceed 20%. As a result, the well managed banks are finding it difficult to augment their capital through equity or GDR/ADR route. Banks like yours, having foreign branches, need to raise capital even in foreign currency as with it

Speech of Shri K. Kannan, Chairman & Managing Director, Bank of Baroda at the Bank's Third Annual General Meeting of Shareholders, at Vadodra on 30th July, 1999.

made provisions for standard advances, Government guaranteed advances and sub-standard advances of more than 18 months. All these provisions have been made by your Bank without adversely affecting the profit position in the current year, by falling back upon the excess unmarked provisions created in previous years.

Apart from complying with the RBI norms with respect to Narasimham Committee-II, I am happy to inform that your Bank has made full provisions for the impending wage revision. It has also adopted AS 15 in respect of other employee benefits like leave encashment and pension. You will agree with me that all these provisions provide a strong cushion to your Bank to face future challenges with confidence.

During the year under review, the operating profit of the Bank increased by 17.22% from Rs. 806.06 crores to Rs. 945.30 crores. This has to be viewed against the provision of Rs. 95 crores made for wage revision which is accounted for as staff expenses. Similarly the depreciation of your Bank at Rs. 421.44 crores, though marginally lower than that of the previous year, should be seen against the write back of investment depreciation at Rs. 168 crores (net of taxes) available in the Bank during 1997-98. Adjusted for these factors the net profit of the Bank would have shown a satisfactory rise over the previous year. The income from treasury accounted for as high as 38% of the total income of the Bank's domestic operations. Your Bank has initiated a series of steps to establish the Asset Liability Management System as also the comprehensive risk management system.

As the Indian banking industry is graduating and integrating into the global financial system it will be interesting to dwell upon certain critical benchmarks relating to management and financial accounting practices and view the bank's performance in the light of these benchmarks. While doing so, I would also like to share my views and concerns about the systemic constraints and initiatives needed in the industry level.

Capital Adequacy

Since 1993 Indian banks are required to adopt the Basle Committee norms on capital adequacy by maintaining 8% capital on the risk-weighted assets. This ratio is now raised to 9% from the year 1999/2000. In an industry where the balance sheet assets are growing at the rate of 14 to 16 per cent per annum, capital augmentation is a continuous process for which banks have to either look to the Govt. or tap other available alternatives. Looking to the budgetary constraints which the Govt. is already facing, additional infusion of capital through budgetary support is

depreciation of the value of Rupee vis a vis the currencies of other countries, would call for high capital requirement. Unless these hurdles are removed by the Govt., the banking system as a whole will suffer on account of limited growth which in turn will adversely affect the timing of genuine credit demand in the economy.

Nevertheless, your Bank is having a low CAR of 13.00%, and is confident of maintaining double-digit capital adequacy ratio in the years to come, to achieve uninterrupted balance sheet growth.

Quality of Assets

Talking about the asset quality, I would like to emphasise here that the incidence of NPAs is global phenomenon. Both developed and developing countries are grappling with the same trends in NPAs. We have to clearly understand that NPAs are nothing but the reflection of the economy and its performance. If economy performs well, NPAs will be less whereas NPAs tend to rise in a recessionary environment. Rising trend in NPAs during 1998-99 was the fallout of economic recession. Further, in tackling the problem of NPAs, much emphasis is laid on accounting system rather than addressing the real issues of NPAs viz. legal problem, improper recovery climate etc.

Within these systemic constraints, your Bank has performed well in tackling the problem of impaired assets. I am happy to inform that it has initiated various proactive steps to improve the quality of its credit portfolio. A comprehensive database on each and every borrower account created at the corporate level for tracking the accounts causing concern and corrective measures have been initiated at every level of the organisation. The net non-performing advances of your Bank stood at 7.70% as of March 1999. However, if the total assets are taken into account the ratio of NPAs to total assets worked out to only 3.09%.

However, we should be pro-active in tackling the problem of NPAs. There is over emphasis on quantifying the NPAs rather than finding solutions to bring them down. As mentioned earlier, NPA is not a bank specific or industry specific problem but a global problem. Also it is closely linked with the performance of the industry and economy as a whole. When the economy is not doing well, there is a greater need to identify the genuine borrower who need to be extended the necessary comfort so that they can be saved from slipping back. Here, all the financing agencies can work in close co-ordination with each other, they could find better and effective solutions to the problem rather than each one trying to deal with the affected borrowers in an isolated manner. Such coordinated effort on the part of all the financing

ies would also result into a common stand on merced borrowers and also ensure effective nning of the agencies like BIFR/DRFI.

Another aspect I would like to stress upon is here is a need to view NPAs from a different ewise. Internationally, NPAs relate in Performing Loans (NPLs) only which is due ervice exposure of banks in loan assets. As his, Indian banks are much more leveraged loan exposure is only about 40-45% with 30% to 35% of their assets in the form of isk securities. The loan to GDP ratio in is only 28% as against 100% or more in

than 1000 shares. In view of such widespread shareholding pattern, I am confident that when the above scheme for elected Board members is implemented it will further strengthen the concept of corporate governance.

The ability of the bank management in tackling the emerging challenges is however limited to some extent by lack of autonomy in certain areas. In order to obviate such limitations, it is necessary to initiate necessary facilitating measures in the years to come so as to create the level playing field for public sector banks. Freedom to enter into strategic alliances in new

Bank is also engaging its attention on business process re-engineering and restructuring of the organisational structure. Your bank has developed an effective MIS to help improve the quality of decision making. But unless the MIS for the entire banking system is integrated at industry level, the islands of information will not serve the needs. The MIS has to be attainable. An industry wide initiative is called for at the level of IBA/RBI for enabling public sector banks to adopt and implement the new technology and thereby ensure that technology upgradation in the system remains cost-effective.

Management of Associates & Subsidiaries

Your Bank is having a well-diversified portfolio, through its wider branch network and subsidiaries in the areas like housing, credit card, merchant banking, mutual funds. In response to the strategic business compulsions, your Bank has taken over the Bareilly Corporation Bank Limited. Its 63 branches have begun to operate as Bank of Baroda branches.

Technology

In the area of technology upgradation, installation of V-SAT, introduction of intra-bank web site and networking of some of the key branches has been undertaken so as to improve competitive edge. There is a network of 17 VLMs of which 10 are linked to shared payment network system (SPNS). Your Bank proposes to add more VLMs to this network and also introduce tele banking services. Your Bank has already started offering the depositary services at its Mumbai branches which will subsequently be extended to other centres.

Considering the changing face of banking, your Bank is gearing up for the challenges of the new millennium. With the conclusion of the tenure of earlier strategic plan Vision 2000, Bank is formulating a five year strategic plan Vision 2005. It is the endeavour of your bank to achieve the distinct edge in risk management, technology and human resources development in the new couple of years.

Acknowledgement

On behalf of the Board of Directors of the Bank and on my behalf I thank every shareholder and customer of the Bank for their continued patronage and support and look forward for ever greater cooperation in the coming years. I also place on record my appreciation to the staff of the Bank at all levels for the efficient and dedicated services and the constructive role played by the employees' organisations in sharing fully the Bank's corporate objective and working towards their realisation. Bank will look forward to a continuing patronage and cooperation of staff stakeholders to help your Bank emerge as a strong global bank in the new millennium. I am grateful to the Government of India, Reserve Bank of India and RBI for their continued guidance and support. I am also thankful to the various State Governments and Union Territories for their continued support in our operations.

K. Kannan

Bank of Baroda
(A Government of India Undertaking)

Head Office: Bank of Baroda Building,
Mandvi, Vadodra - 390 006

Shareholding Pattern as on 31st March, 1999

Last Asian countries. Viewed against this ground, banks in India are much better off than international counterparts. For your the total NPLs work out to only 31% of assets which compares well with the banks in the economies. Even then, your bank is using prudent norms of income recognition, classification as well as provisioning so as to then the balance sheet further and improve shareholders' value.

Corporate Governance

Liberalisation and deregulation is generally viewed not only in terms of the freedom to the interest rates, introduce new products and services and implement the prudential norms but also to install best practices corporate Governance. Hence, in order to the above, it is also necessary to have management systems in place. The core of planning, co-ordination, control and are to be performed by the top management in line with the best management. I am happy to inform that your Bank is with talented Board Members, representing various interest groups and its like Chartered Accountants, legal specialists, Environmentalists, Economists, Bureaucrats and academicians. The committees/Sub-committees of the Board constituted for taking decisions on operational and policy matters. These committees closely follow the performance of the Bank in various areas like audit, inspection, risk management, and new financial services. With a view to enhancing the shareholders' value, Bank is striving to achieve high levels of transparency and stability by adopting best management practices. As a responsible corporate citizen your bank initiated measures to help the societies through institutions, hospitals, schools etc. through such measures.

In terms of General Regulations, 1998, stated by your Bank in exercise of the powers conferred by Section 19 of the Banking Companies (Acquisition & Transfer of Undertakings) Act, in consultation with Reserve Bank of India, interested shareholders shall appoint their representatives on the Board from amongst themselves. Further, four directors excluding the Government will be elected by shareholders after following the procedures. This will be in accordance with the present non-official Directors on Board. Necessary steps in this regard are taken.

Your Bank is fortunate to have the patronage of a large number of small shareholders. It may be noted that 2,51,251 shareholders (99.9% of the total) of your Bank are holding less

areas of banking, redefining the remuneration packages, allowing banks to pursue productive programmes and guidelines for mergers and acquisitions will go a long way in creating a healthy and enabling environment.

Operational Efficiency

With increased competition in deregulated interest rate environment, banks in India have to learn to live with lower interest margins. The initiatives taken by the Reserve Bank of India in introducing Asset Liability Management System and Risk Management process are most welcome. However, this being a new concept, banks will take some more time to orient themselves to the new management tools. Further, the vast network of branches working on manual system is going to remain a major challenge to Indian banks. Massive investments in computerisation as well as human resource development are needed on the part of banks to equip themselves with the required database. This is one area where an industry wide initiative is badly needed so as to ensure uniformity of approach and reduction in the learning costs. The Indian Banks' Association may assist banks in strategy formulation and networking with other banks.

Liquidity and Risk Management

Your Bank has also integrated its treasury operations by combining the functions of money market, investments and dealing operations under one roof. Your Bank is also in the process of integrating its Overseas Money Market Operations with the domestic treasury, thereby optimising returns from globalised treasury operations. During the year under review, your Bank preferred to maintain a high liquidity due to the volatile international scenario. As a result, Bank of Baroda has been a net lender in the Call Money Market throughout the year. With the establishment of full-fledged Asset-Liability Management System, your Bank will be in a better position to identify, quantify and manage the liquidity as well as interest rate risk.

Support System

Management of change is the key to success of your bank in the new banking environment. Information Technology (IT) and Intellectual Capacity (IC) are the prime movers which your Bank have adopted in coping with the challenges of reforms. Your Bank has embarked upon a massive technology upgradation plan, involving V-Sat networking, LAN, WAN, ATMs and Internet banking. In tune with these initiatives,

Emerging Scenario

As it moves towards the new millennium, the Indian banking industry faces new challenges in terms of narrowing spreads, new banking products and players, multi-currency operations, global sourcing and deployment of funds and mergers and acquisitions. Adoption of risk management tools and new information technology is no more a choice but a business compulsion. Internet technology is multiplying the opportunities of business expansion. Success of banking sector in the new millennium hinges on technology, product innovation and sophisticated risk management systems.

Further, the increasing expectations of customers coupled with easy alternatives have created a systemic pressure on banks to improve productivity. Besides the traditional services, customers today also want structured products catering to their specific requirements. The speed of response to the changing business environment has become a critical factor for the success and survival of banks.

Strategic Initiatives: Technology, People & Vision

While preparing to become a leading global player in the new millennium, your Bank has identified three important inputs to be harnessed to their optimum level and take the Bank to greater heights. These ingredients are Technology, People & Vision. Keeping the long term vision in view, Bank has embarked upon the task of introducing the new information technology intended to improve the speed and quality of banking services. However, banking industry still continues to be people oriented and hence the attitudes, orientation and skills of employees have to change in keeping with the changing times.

Asset Liability and Risk Management

Your Bank is seized with these strategic issues and has initiated appropriate measures to convert the opportunities into successful business deals. Bank of Baroda is in the process of appointing consultants for enterprise wide risk management system including treasury and M.M. Your Bank is also aiming at integrating its overseas treasury operations with the domestic treasury and thereby developing a competitive global treasury function with state-of-the-art technology. Appointment of in-house committees for product development, re-organising the functioning of various departments etc. are some of the initiatives taken by your Bank to enhance organisational efficiency.

Economic Reform Strategy for the Next Decade

Raja J Chelliah

As we near the end of this decade and century, it seems opportune to look back, review the developments that have occurred in the Indian and the world economies and examine what lessons we can learn from our experience with reforms in the context of world developments. In the light of these lessons, we can determine the kind and pace of reforms that should be pursued during the coming decade.

ALTHOUGH the need for changes in the structure and elements of economic policies that were being followed since the beginning of the Second Plan had been recognised in the eighties, only mild reforms had been introduced till the end of that decade in the form of some reduction in the rigour of controls and of allowing the market a little more play. Some little liberalisation of imports had also taken place. There was no general willingness to give up or alter in any substantial way the philosophy that was the foundation of the economic policy framework. Then, in the midst of the grave balance of payments (BOP) crisis of 1990-91, the decision was taken in 1991 by the government of Narasimha Rao to give up the old paradigm. It initiated far-reaching reforms that would transform India from a controlled closed economy into a fairly open economy in which not only would the private sector have a much enhanced role, but the market would be given the prime role in the allocation of resources. Further, there would be a gradual opening up of the economy so that the economy would become linked to the world economy to a substantial extent.

That changes in these directions were necessary and indeed inevitable was tacitly accepted by a large section of industry, business, political parties and economists, but it would be wrong to say that there was a general consensus among the political parties or intellectuals. Opposition came notably from the vested interests that were adversely affected, from those who could not or would not change their ideology and also from many who had genuine fears about the possible negative impact on the poor and on our sovereignty.

But fortunately, the major reforms carried out in the years 1991-92 to 1994-95 had by and large very favourable effects on the economy. In the years immediately following the start of the structural adjustment programme (SAP), or later, India did not suffer any drop in total GDP, high inflation or sizeable increase in unemployment unlike in many other developing countries which carried out SAP with or without stabilisation measures. In my view

the stabilisation programme had some negative effect because of the compression of imports and of government expenditure. The SAP had on the whole a positive impact.

In the nineties the growth rate of GDP could reach the level of 7 per cent per annum (Table 1). After three years of high growth, the economy entered a period of downswing and deceleration in growth with the onset of political instability and the east Asian crisis. Still, the rate of growth of GDP hovers around 5 per cent. The average rate of growth in the nineties up to 1996-97 (including the early years affected by the BOP crisis of 1990-91 and the stabilisation attempt) is not much higher than that of the eighties. But there is a significant difference. This rate has been achieved in the context of a slowdown in the world economy and has been sustained along with a remarkable build-up of our foreign exchange reserves. Indeed in the external sector there is a remarkable transformation. Three significant developments may be noted: (a) a tremendous increase in foreign investment; (b) a very large flow of remittances with a realistic exchange rate; and (c) remarkable growth in exports until the beginning of the world economic slowdown and no balance of payment problem after 1991-92.

The most significant gain from the reforms so far carried out is the capacity to grow at a fairly high rate without running into BOP problems, provided of course reasonably sound fiscal policies are followed. As Bimal Jalan has pointed out, in 30 of the 36 years preceding 1990-91, we had some BOP problem or the other [Jalan 1992]. Now it can be said that we have achieved self-reliance in one important respect. Ironically, the extreme left is saying that we have come under the dominance of IMF and the World Bank, whereas the fact is, unlike in the past, we do not need to go to the IMF at all, and can carry on even without World Bank loans.

During the next decade, to sustain a high rate of growth, we need, among other things, to maintain a high growth of exports and obtain large and growing remittances and sizeable foreign investment. For this

purpose, we have to have a fairly open economy with a realistic exchange rate and the efficiency of our economy has to be further increased. Therefore, there is no doubt that the major reforms carried out from 1991-92 to 1996-97 were in the right direction. In the subsequent two years some more reforms have been carried out, but owing to political instability and quick changes of government, the reform initiatives have not been quite consistent and in some areas the action has not been carried out on a sustained or consistent basis.

CONSIDERATIONS FOR DETERMINING THE DIRECTIONS OF REFORMS

As we near the end of this decade and century, it seems opportune to look back, review the developments that have occurred in the Indian and the world economies and examine what lessons we can learn from our experience with reforms in the context of world developments. In the light of these lessons, we can determine the kind and pace of reforms that should be pursued during the coming decade.

While undoubtedly the major structural changes have benefited the economy, we must recognise that there is some genuine fear in some sections of the population that the direction of reform – greater role for the market, vastly reducing the importance and role of public enterprises and opening up the economy to foreign investment and MNCs – would adversely affect the vulnerable sections of the population and even erode the substance of our national sovereignty. We should examine

TABLE 1: GROWTH OF GROSS DOMESTIC PRODUCT (At constant prices, 1990-91 to 1996-97)

Years	Rs Crore	Per Cent
1990-91	2,12,253	5.36
1991-92	2,13,983	0.82
1992-93	2,25,240	5.26
1993-94	2,39,145	6.17
1994-95	2,57,700	7.76
1995-96	2,76,132	7.15
1996-97Q	2,96,845	7.50

Annual average rate of growth, 1980-81 to 1989-90 = 5.69.

Annual average rate of growth, 1990-91 to 1996-97 = 5.75.

Q – Quick Estimates.

the grounds for these fears in the light of our and other countries' experiences. I know that some groups like the extreme left are repeating old arguments on ideological grounds or to please their special constituencies. However, it would be quite useful to consider if a re-orientation of the economic reforms is needed to minimise their adverse economic, social and political effects.

The ratio of population below the poverty line is subject to a secular trend but is also influenced by fluctuations in output in particular years. It is seen that according to official figures, the poverty proportion in India (the so-called head-count ratio) fell from 38.5 per cent in 1987-88 to 35 per cent in 1993-94. (In between there was a slight rise in the ratio in one year according to calculations based on a smaller sample.) The reforms have not reversed or altered the trend of steady fall in the head-count ratio since 1973-74 [Chelliah and Sudarshan 1999:5, Table 1.1]. Also, it is seen that the economically better off states (in terms of higher per capita incomes) such as Kerala, Punjab, Haryana and Gujarat have lower poverty ratios. (In Kerala, the per capita income is distinctively higher than per capita SDP.)

Fast growth is thus essential for reducing poverty and it does reduce poverty. However, the economic reforms that accelerate growth could adversely affect some poorer sections in the short run. Also, when substantial changes take place, there are gainers and losers. Hence the society (government) has to provide a safety net for those affected and also slow down or modify the reforms to safeguard the interests of the vulnerable sections. We need to look back and examine whether during the decade we have imposed undue hardships on some sections of the population and how similar effects can be avoided or mitigated.

In considering the directions of reforms in the next decade we must also keep in mind the fact that India, which has been criticised by strongly pro-reform economists (westerners as well as Indians) as being too tardy and too slow in carrying out structural reforms, was not affected by a financial crisis such as those suffered by the south-east Asian nations or Mexico. Furthermore, we survived, fairly unscathed, the severe impact on the world economy of the crisis that overtook the Asian economies. From this experience we might perhaps legitimately draw the conclusion that there is a trade-off between stability and growth in efficiency and productivity. Hence, in the pursuit of efficiency we should not expose ourselves to excessive instability by proceeding too fast with reforms *in some directions*. In

my view, this is an important lesson we have learnt (or should learn) from the events of the last three or four years.

It is also to be kept in mind that the relatively small size of the external sector in India, in terms of the ratios of imports/exports to GDP, is a factor that helps ensure that the economy is relatively less affected by fluctuations in the world economy. This of course does not mean that the degree of openness should not be increased; indeed exports as a percentage of GDP must grow from its present level (8.5 per cent). But the extent of increase needed could be moderated or reduced by maintaining near self-sufficiency in basic foodgrains and increasing the efficiency and productivity of industries in several key sectors so that the need for greater imports also would be moderated. For maintaining near self-sufficiency in basic foodgrains we need to invest more in agriculture and further increase agricultural productivity and also drastically curtail the growth of population so as to bring about the state of zero population growth within the next 10 years.

At this juncture, with a fractured polity, it is difficult to bring about a general consensus, embracing at least the major parties, on the nature and pace of economic reforms to be carried further without some compromises. The compromises cannot be such that the growth rate of the economy will be significantly affected. I would say that a minimum 6 per cent rate of growth should be achieved and maintained. And improvement in resource allocation and increase in efficiency should continue to be given high importance. But the increase in efficiency needed to maintain a fairly high rate of growth could be attained even if some moderate compromises are made in areas where trade-offs are involved the choice among which is partly dependent on value judgments or differences in perception. In this context, I would urge that economists should clearly distinguish their value judgments from the positive economic propositions they are propounding on the basis of their empirical observations and scientific analysis.

Given that there are important trade-offs, there are bound to be differences in the relative weights attached to various objectives by different individuals, hence economic advisors have to work out certain compromise packages. In other words, we as advisors should give priority to reforms which are essential and most beneficial and agree to slow down or postpone reforms in some areas which would not cause any significant slowdown in growth. We need not accept all the advice that western economists might give.

The three basic objectives that we should set before ourselves for the next decade are: (a) 6 to 6.5 per cent annual rate of growth of GDP; (b) considerable emphasis on human development such that there is at least 20 per cent point improvement in social development indices such as rate of literacy, rate of infant mortality, expectancy of life at birth, extent of malnutrition and incidence of infectious diseases; and (c) reversing the trend of worsening regional disparities by initiating a trend of reduction in the gap between the per capita SDP of the poorest states and the highest per capita SDP; and also reducing the disparities in the state of infrastructural development.

The economic reform strategy for the next decade will be dictated and determined by these objectives. For achieving the objective of maintaining an average rate of growth of 6 per cent (from now on the figure of 6 per cent growth rate is used to stand for 6 per cent or slightly higher than 6 per cent) we will continue to need a high rate of domestic savings of around 24 per cent, foreign investment amounting to around 2 per cent of GDP (implying a current account deficit of the same magnitude), a fairly high rate of growth of exports (10 per cent), sustained further improvement in efficiency through competition, better resource allocation and beneficial changes in laws and procedures. There have also to be conscious efforts to considerably improve the infrastructure and performance of the backward states. For this purpose, there would be need to divert more investible resources as well as resources for human development to the backward regions. It is for this reason that the suggestion has been made that we should aim at around 6 per cent rate of growth although if resources are not to be consciously diverted to the backward areas and investment is concentrated in areas where the immediate rate of return will be quite high, we might be able to achieve even a 6 to 7.5 per cent rate of growth.

We should concentrate on carrying forward, or initiating those reforms which are essential for, or would be helpful in, achieving the objectives mentioned above. Considered in this perspective, I believe that it is not necessary to make any preparations for moving towards full capital account convertibility. Some relaxation in regulations regarding flows on capital account could and should be made, but past experience shows that for maintaining a 6 per cent rate of growth and attracting a fairly sizeable flow of foreign investment into India full capital account convertibility is not necessary. On the other hand, maintenance of stability is

greatly helped by the kind of controls we have on movements of capital.

INTERNATIONAL ASPECTS

There is difference of opinion among political parties on the degree of opening up of our economy to foreign trade and foreign investment. As regards foreign trade, we are members of WTO and as such we are bound to fulfil all the obligations entailed by that membership. It could be argued that developing countries could have obtained WTO rules more favourable to them in some important respects. It is now too late to go into that question. Anyhow, taking all the provisions together, India definitely stands to gain by the coming into operation of all the agreements. If we lose something in the area of pharmaceuticals and agrochemicals, we stand to gain in the field of textiles, etc.

Membership of WTO also requires that we should abide by the agreement on TRIPS. Out of the eight categories of intellectual property for which standards of protection are incorporated in the TRIPS agreement, our existing and proposed laws and regulations in respect of six categories of intellectual property are largely in consonance with the required standards. Our concerns with respect to TRIPS agreement are limited to granting product patent to pharmaceuticals and agrochemicals, patenting of micro-organisms or life forms and establishing an effective *sui generis* system for the protection of new plant varieties, i.e. plant breeders' rights [Ganesan 1999:vi].

To take the first category, namely, granting of product patents to pharmaceuticals and agrochemicals, the fear in the minds of many is that prices of new products will go up considerably after the product patent regime comes into effect by 2005. In the interim, that is until India introduces the product patent regime by January 1, 2005, we have to grant exclusive marketing rights (EMR) to products for which patent obligations were filed in India and elsewhere on or after January 1, 1995. A number of people have misgivings about granting EMR. This fear is not warranted because, as A V Ganesan points out, EMR will be extinguished by the end of 2004 and between now and that date probably 10 or less products will seek EMR. The reason is that it generally takes eight to 10 years for a new patented product to come into the world market from the date of filing the patent application [Ganesan 1999:v].

As regards product patents for pharmaceuticals, while it is true that the prices of new products will be higher than what they would otherwise have been, we must

recognise that the inventors' rights have to be protected and piracy should not be rewarded. Perhaps, if the representatives of developing countries had understood the implications better and had insisted during the negotiations on conditions that would have been beneficial and could have been obtained with pressure, we could have had a regime more favourable to developing countries. For example, the developing countries should not have agreed to a uniform period of protection of 20 years for all commodities. In respect of patents, for which applications are filed after 2005, the period could have been cut down to 10 to 15 years – 10 for pharmaceuticals and 15 for other products. But now we have to make the best of the existing situation.

We must remember that many developing countries have already enacted legislation granting product patents. Apart from that, since we have the capacity to conduct research and produce new pharmaceutical products, in course of time we would greatly benefit by product patents in this area. We should encourage R and D in the pharmaceutical field and at the same time the government should effect improvements in the working of the patent office and in procedures relating to the grant of patents.

The Uruguay Round of Multilateral Trade Negotiation was concluded in 1993 and the results of the negotiations were embodied in the Final Act or the international treaty that was signed by the ministers of the member countries in 1994. Apart from TRIPS, the Uruguay Round led to agreements in a wide area covering agriculture, textiles, tariffs, trade rules, services and trade related investment measures. All of these agreements are such as to promote more competition, liberalisation and fair play while affording protection to the rights of 'inventors'. It is the developed countries which pushed for greater competition, liberalisation and protection. Hence there is grave apprehension among several people in India which defines itself as a developing country.

There are fears that our agriculture and food security will be severely affected, that the agreements on trade related investment measures (TRIMS) will force us to accept foreign investment in all areas with majority participation and that our service industry will be totally submerged by large foreign service providers. Many of these apprehensions are not well founded. However, we certainly should be on our guard and in all future negotiations ensure that our gains will be at least as much as the gains of the developed countries. At the moment, we must concentrate on strategies to be adopted to maximise the gains

from, and to minimise the adverse effects of, the agreements. Generally speaking, we should adopt a conservative approach and take full advantage of the transition periods granted for the different agreements to be fully implemented. We should be prepared to be tough in the negotiations on opening up the field of services.

We are quite well placed as far as agriculture is concerned. Except for one or two commodities, our minimum support prices for different agricultural products are far below the prevailing international prices. Our public distribution system and the system of buffer stocks will not be affected. Our policies should aim at maximising our benefits from the agreement on agriculture [for detailed discussion, see Debroy 1998:pp 13-20].

As already pointed out, the agreement on TRIMS does not require a member country to grant unrestricted entry to foreign investment or to grant majority equity stake in all cases. It does not also prohibit export obligations. We have plenty of elbow room to formulate our policies regarding foreign investment to suit our needs and ensure that our long-term interests are not affected. My own view is that we need not go overboard in attracting foreign investment. Even with the restriction of majority foreign equity participation to some important industries where high technology is needed, to power generation and to construction of important infrastructure projects such as roads and ports, we can attract high volumes of foreign direct investment. The present rules regarding direct foreign investment go beyond this [see Government of India 1999: Annexure III] and 100 per cent equity can be granted to the foreign party by the Foreign Investment Promotion Board (FIPB). It is said that FIPB is becoming the main channel through which FDI is flowing. Under the present policy 74 per cent foreign equity is allowed in some areas which seems unwarranted. And in any case FIPB can give the nod to 100 per cent equity. There are some sections which are solidly opposed to all majority foreign equity. Here is an area where a compromise can be effected without losing the advantages of foreign investment. We certainly need to take a second look at the rules regarding FDI.

Another important area where we have to formulate a proper strategy is international trade. On the imports side, we have to shift from QR to tariff control of imports – except for food crops (this is part of WTO obligation) and we have to gradually reduce the level of import duties. The gradual reduction of import duties must keep pace with the increase in the degree of general efficiency of the economy and

the increase in the productivity of our industries. We must assiduously promote these two goals. And we must draw up a calendar for the phased reduction of import duties in consultation with industry groups. Such a policy will cause the least instability and give time to the affected industries to make the necessary adjustments. Domestic trade tax reform is also essential as cascading taxes place domestic producers at a disadvantage in the home market as well as in the world market. Instead of speeding up the reform of domestic trade taxes – especially the cascading taxes at the state and local government levels – the government of India has imposed a special additional duty on imports to counteract the cascading effect of the domestic taxes.

I have already underlined the importance of the growth of exports. A high growth rate of the economy cannot be sustained without a corresponding high growth of exports. This is because imports will grow *pari passu* with the growth of GDP and in order to maintain the viability of our balance of payments, we need sufficient growth of exports whose proceeds can pay for the cost of a high proportion of imports. In that case the deficit in the balance of trade can be kept down to manageable limits. However, we should not aim to transform ourselves into what may be called an export-oriented economy. The limited degree of openness shields us to a good extent from fluctuations and cyclical crises in the world economy. The large share of agriculture in GDP is also a cushioning factor.

The rate of growth of exports that I have suggested as a target is a modest one, and within our reach if we pursue the right policies and bring about the necessary changes in the economy and governance. With a 6 per cent growth rate, imports are likely to grow at about 9 per cent, if we have the calculation on the buoyancy of imports in the period 1993-94 to 1997-98. With remittances continuing at the same rate (as per cent of GDP) and a current account deficit of 2 per cent of GDP to be met largely by foreign investment, we should have a comfortable balance of payments situation. However, at the end of the decade (i.e., by 2010) the ratio of exports to GDP would be only around 12.5 per cent.

In order that our exports may grow at an average rate of 10 per cent per annum in dollar terms and also in order to be able at the same time to bring down gradually import duty levels, in most cases, to the levels prevailing in the Asian developing countries, we need to effect quickly other changes/reforms needed to bring about higher productivity and efficiency in all

sectors of the economy – industry, infrastructure, the transport system, the financial system, governmental laws and procedures and tax administration.

There will be general agreement about the need for bringing about improvement in the legal system and governmental procedures and the steps to be taken for that purpose. But there are obstacles to reforms in other areas or there are some ideological differences about how to proceed.

PUBLIC SECTOR REFORM

One sphere where reforms are absolutely necessary is the sector of public enterprises (we exclude the railways and the electricity boards for the time being). There is no doubt that more than half of the public enterprises of the centre and the states taken together cast a heavy burden on the economy. There are a very large number of loss-making unviable public enterprises. Even among public enterprises that are making profits, many are inefficiently run, are overstaffed and are subject to political interference and patronage.

Several public sector banks have sizeable NPAs. Some are making losses, almost all are overstaffed. With a few notable exceptions, the general level of efficiency of public enterprises cannot be said to be satisfactorily high. Hence the reform of public enterprises is absolutely necessary.

One extreme view is that there should be complete privatisation and the government should get out of the production of all private goods except for atomic energy and military related industries. This view is naturally opposed by socialists and trade unions and also those who do not wish to rely completely on private enterprises. The view that the government sector should concern itself only with the production of public goods and some part of merit goods (except for some highly sophisticated weaponry and military goods) is generally held among western economists and policy-makers. In their economies governments do not play a direct developmental role through investment. Their private enterprises are large, efficient and multinational in scope. This is not the case in India. It could be legitimately argued that here in some important areas public enterprises should continue to exist at least till the private enterprises come of age.

Moreover, it would seem that public enterprises impart a measure of stability to the economy because of the reason that public investment is not so sensitive to market signals. When profit expectations are reduced and as a result private investment falls, government could induce the public enterprises to maintain their investment levels which at least to some extent

would counteract the deflationary impact of reduced private investment. One of the reasons for the relative stability of the Indian economy in the midst of Asian crisis may be the existence of relatively large public enterprises.

Whatever may be ultimately decided upon, for the coming decade we need to place emphasis only on substantially reducing the burden that the functioning of the public enterprises is imposing on the government and the economy. For this purpose, we do not need complete privatisation. Here again it is possible to effect a compromise. Instead of debating the question whether there should be wholesale privatisation, we could agree on certain specific steps to increase the efficiency and reduce the financial burden on the governments. I would suggest the following:

- (a) Sell or close down loss-making public enterprises producing all non-strategic private goods in a phased manner. One-tenth of the total number of such public enterprises should be closed down each year. In this way, we can avoid causing hardship to a very large number of employees within a short period. It would be easier to take care of a limited number of people/labourers affected in any one year. The labourers who would lose their jobs should be given generous compensation and also priority for appointment to fill vacancies that arise in the government or other public enterprises (other things being equal). No attempt should be made to revive these enterprises as, in any case, the governments are not to spend their energies on producing such private goods as cement, textiles, sugar, cables and leather goods.
- (b) Private shareholding should be brought into profit-making public enterprises in all areas except railways, atomic energy and most defence related industries. Among them we can distinguish three categories: (i) those which are to be sold off to the private sector; (ii) those in which the government need only to have 49 per cent of equity, so that the enterprises can become truly autonomous; and (iii) those in which for policy purposes or because of the importance of the industry concerned, the government would like to have majority shareholding.
 - (i) Enterprises to be sold off: public enterprises engaged in producing consumer goods and services or some minor producer goods.
 - (ii) In many public enterprises which are not producing basic or strategic goods (but only goods such as chemicals, petrochemicals, drugs) or are running hotels or engaged in transport

services, the government should hold only 49 per cent of equity.

- (iii) In public enterprises in the areas of basic goods, aeronautics, banking, development finance, petroleum exploration and refinery, etc., if they are profit-making and reasonably efficient, the government should retain 51 to 74 per cent equity. Where important policy decisions are involved it may be necessary for the government to hold 74 per cent equity. This is also necessary if a foreign private partner is involved. In banking, government equity could be brought down to 51 per cent.

It is an accepted proposition that except for railways, atomic energy and strategic defence related areas (e.g. missile development), public enterprises should not be monopolies. Public enterprises in both categories (ii) and (iii) should be subjected to competition. Such competition has been allowed now in many sectors, though in some areas, e.g. airways, it is still limited. There must be good exposure to private sector competition in all areas. There should be some private sector equity participation (through the issue of new shares) in LIC and GIC. Apart from that Indian private sector companies should be allowed into the insurance business, but initially only a few of them may be licensed. Private sector insurance companies may be allowed foreign partners holding up to only 26 per cent equity. Pension business should be allowed to be carried on only by public trusts. I am saying this in this light of the experience of the developed countries with private pension funds.

I have been talking about bringing private sector equity into public enterprises and reducing the government's stake. This involves disinvestment as well as issue of new equity. As of now, funds from disinvestment are used to cover government sector deficit. In my view, this is a totally wrong policy. Government should fix the permissible level of deficit by determining the amount of borrowing that could be considered prudent and proper from the macro-economic point of view, and then keep the deficit down to that level by adjusting the level of expenditure, given the amount of revenues that are contemplated to be raised. The funds from disinvestment should not be brought into the budget to cover the deficit.

I would suggest that there should be a separate extra-budgetary fund into which the proceeds of disinvestment in public enterprises should be put. This fund could be used to subscribe to the capital of infrastructure finance companies, to lend to enterprises to finance the construction

of roads, ports and other such facilities, to pick up the rights shares issued by public enterprises, etc. In other words, government should use the proceeds so as to maintain the level of its assets.

As regards railways, their monopoly position has to be maintained and with all its disadvantages the control of the railways by the government has also to remain. However, the railways should concentrate on providing services and leave largely to the private sector the production of wagons, engines and other equipment so that their own surpluses could be used mainly for expanding the railway network or to effect improvement in tracks, signalling equipment, etc.

We then come to the state electricity boards (SEBs). Along with the closure of loss-making public enterprises, the reform of SEBs should be taken up on a priority basis. The extremely unsatisfactory state of the electricity boards in terms of both efficiency of operations and of financial results is too well known to be detailed here. With only one or two exceptions, the SEBs are incurring large commercial losses. Most of them owe sizeable dues to the central public undertakings from which they are buying power or material or services. There are large transmission losses (to a sizeable extent accounted for by pilferage) and the plant load factor, although it has improved during the nineties, is still low on an average (for details see Table 2). Given their financial condition, they are in no position to generate funds either to add substantially to capacity or to spend on renovation or modernisation. Since the SEBs are state government enterprises, they cannot act independently to set adequate tariff or to reduce their staff size to a reasonable level or enforce discipline. There could be no reform of the power sector until the SEBs are effectively taken out of the control of the state governments. There are two steps involved in the reform. First, the operations of the SEBs should be 'unbundled', i.e. generation, transmission and distribution should be separated and be put in the charge of different entities. The private sector should be brought into generation as well as into distribution. The SEBs can

gradually get out of the business of distribution. Transmission should be in charge of one corporation in which the government may hold 30 to 40 per cent stake. There should be effective competition in the sectors of generation and distribution. The tariff and the wheeling charges will be set by an independent State Tariff Regulatory Authority. Reform along these lines has already been started in the states of Orissa, Andhra Pradesh and Haryana. If we wish to maintain a reasonably high growth rate during the coming decade, the state governments should be pressurised to bring about reform of their power sector along the lines indicated as quickly as possible. Nothing stands in the way of such a reform except short-sighted political considerations. One hopes that the major political parties in each state would arrive at a consensus on this issue in the long-term interest of the people of the state concerned.

STATE LEVEL REFORMS

The state governments do not seem to realise what a great handicap the state of their roads is to industry and trade and what delay and consequent increase in costs is caused by the various hindrance to the quick and free movement of goods which exist because of the state governments' own policies and procedures.

Even our major highways cannot stand comparison with those in any developed country or even the roads in China's developed provinces. The unsatisfactory condition of the roads and the checks and stops to which the traffic is subjected significantly increase the costs of production in the economy. Take this example: today it takes a truck an average of 6 days to carry goods from Mumbai to Calcutta. It must traverse no less than 14 checkpoints/octroi stations during the trip where approximately two days are lost in waiting. The average speed on the existing roads is only 40 kms per hour. Trip between Mumbai and Calcutta, or Delhi and Chennai, should not take more than two days at safe average speeds of about 60-80 kms per hour on a reasonably good roadway system. With such a system, the savings in fuel costs and better transport turnaround times would be significant.

TABLE 2: DATA ON POOR PERFORMANCE OF SEBS 1997-98

(1) Commercial losses	Rs 10,164.9 crore (without subsidy)	
	Rs 7,218.7 crore (with subsidy)	
(2) Sales revenue as ratio of cost	80.5 (average)	
(3) Outstanding dues payable to central sector power corporations	Rs 16,807 crore with surcharge (as on 30.9.1998)	
(4) Plant load factor (thermal)	Average	64.4
	Lowest (Bihar)	15.3
	Highest (Andhra Pradesh)	78.3
(5) Transmission and distribution losses (per cent) (leaving out J and K)	Average	29.6
	Highest (Orissa)	34.8
	Lowest (Maharashtra)	14.8

Source: Government of India, Ministry of Power (1998).

(TELCO Annual Report, 1999, p vi). The layout of the present roadways is inadequate and dangerous for the density of commercial vehicles, passenger cars and other local forms of transport that ply these roads. Roadway deaths have become an issue of national concern.

The urgent need to improve the road traffic system is well recognised. Investment of huge amounts of money is required. Hence the private sector has to be brought in. This is also recognised. But the movement has been slow. And no worthwhile attention has been paid to the removal of hurdles to the free flow of traffic. The state governments have to consider this area as one priority area for reform along with the power sector.

Indeed during the coming decade, most of the pressing reforms have to be carried out at the level of the state governments. No great ideological issues are involved in these reforms except perhaps in the case of reform of the power sector.

The major reforms and the policy changes to be effected at the state level during the coming decade are:

- (a) power sector reform;
- (b) improvement in the roads and extension of road network;
- (c) removal of hindrances to a maximum possible extent to the free movement of goods;
- (d) closing down or sale of loss-making public enterprises;
- (e) reduction in subsidies in respect of consumption of power by the agricultural and domestic sectors along with other reforms in the power sector;
- (f) at least partial privatisation of the road transport (passenger) services; and
- (g) higher outlay on primary and secondary education, health and family planning and significant improvement in the standards of these services.

The obstacles to reform are to some extent lack of understanding, short-term political considerations, and lack of financial resources. Understanding of issues is growing, but there seems to be no improvement in the financial conditions of the state governments.

Though I mention it last, improvement of the fiscal situation of the state governments is a precondition for several reforms. The reform of the power sector would significantly aid the governments in improving their financial position. However, given the extremely weak financial position of most state governments, structural reform of the budget including tax reform, expenditure control and public debt management are called for. While the reform of state-level public enterprises would help to some extent, it is absolutely necessary to raise the ratio of revenues to

state domestic product (SDP) by at least 1 to 1.5 percentage points. Correspondingly, on the other side, administrative expenditure and the size of the administrative staff would have to be drastically reduced. All in all the ratio of government's revenue expenditure to SDP should be brought down by about 1 percentage point. These changes would ensure that the revenue deficits of the state governments would be wiped out and that all their borrowings could be used for capital formation. Most of the capital formation can be for infrastructure development and for human development, with public enterprises not requiring any investment because most of them would be gradually phased out.

CONCLUSIONS

It would be seen that many of the reforms sketched above would help rather than adversely affect the poor. However, it is necessary not only to moderate the growth-promoting reforms to safeguard the interests of the poor and the vulnerable sections (such as only gradually phasing out loss-making public enterprises), but also to formulate special policies designed to protect those sections. Small fishermen operating near the coast with non-mechanised boats, handloom weavers, and tribals dependent on the forests are examples of sections of the population to protect whom special schemes are needed, even though there would be some loss in efficiency. Every government should announce publicly what schemes it has formulated in this regard, and the legislatures should discuss and monitor their progress. These schemes are to be apart from the traditional poverty alleviation programmes.

But the major succour to the poor will come from growth and progress in human development. In the coming decade, the decline in the ratio of expenditure on human development to total government expenditure should be reversed. The proportion of expenditure on administration, unwarranted subsidies and interest payments should be brought down to make the former possible.

As I had emphasised earlier, we should ensure that proportionately more resources are diverted to the backward states. To begin with, a special development programme must be prepared for Bihar (other backward states can be taken up in turn). This development programme should be geared to flood control, irrigation, agricultural development, land reforms and infrastructure development. This programme should be developed in consultation with the state government jointly by the Planning Commission and a team of experts

with assistance from IDA. Most of it will be implemented by the central government or under its supervision with the state government being associated with the Supervisory Committee. That is to say, there will be turnkey projects undertaken under the supervision of the centre. This programme will be in addition to the normal plan of the state and central assistance to the plan. There would be an incentive for the state to accept this programme because it will gain enormously in terms of additional investment (say, around Rs 15,000 to 20,000 crore). I am suggesting that the programme for Bihar should be largely concentrated on agriculture and infrastructure development (roads and power) because Bihar can become a large and efficient producer of rice. With the WTO obligations in agriculture coming into force and the large subsidies given by the developed countries gradually being reduced, there will be a world market for rice from Bihar. The consequent agricultural prosperity will trigger industrial development in Bihar. This is one other important change in development strategy that I am advocating.

If the matter is left to the politicians alone, the reforms will not come up to the desired level. Of course, we must lobby with the political parties for the adoption of a reform agenda on the lines detailed in this paper. That would not be enough. Intellectuals, professionals or housewives, industry associations, NGOs and in fact the entire middle class should constantly apply pressure on the governments to do what is good for the people in the long run. Without the active participation of the intelligent and informed electorate in public affairs, through NGOs or otherwise, progress is likely to be much less than the country is capable of achieving.

[Dr Waheeduddin Khan Memorial Lecture delivered at Centre for Economic and Social Studies, Hyderabad, August 9, 1999.]

Citizenship, State and Civil Society

Andre Beteille

A great deal of the recent enthusiasm for civil society in this country has been, unfortunately, driven by a negative, if not a hostile, attitude towards the state, and, indeed, towards all public institutions. Nothing can be more destructive of civil society than the idea that the best way to create and invigorate civil society is to empower the people at the expense of the state. And just as state and civil society are complementary, so are state and citizen. Furthermore, civil society cannot amount to very much where citizenship is absent or weakly developed.

I HAVE read Gurpreet Mahajan's recent article, 'Civil Society and Its Avatars' (EPW, May 15, 1999) with interest, and found it to be scholarly, thoughtful, and, on the whole, well-balanced. We need a fuller and more extended discussion of the subject, but, unfortunately, most of those who speak and write on civil society in India yield all too easily to pious platitudes about the inexhaustible resources of our common people (as against the 'elites') and of our traditional culture (as against 'post-Enlightenment modernity'). Mahajan has set a good example by raising difficult questions about the problems and prospects of civil society in India. Such questions need to be seriously addressed, and not just swept under the carpet.

Since Mahajan has referred to a couple of my essays, I would like to use the occasion to clarify some of my own ideas on the subject. My objective is not to find fault with her for misrepresenting my views, but to see if the discussion can be carried forward a little further. Since the two essays I had published on the subject were both very brief [Beteille 1996a, 1996b], it is possible that arguments that were present in my own mind were not made clear enough for the reader. In any case, as Mahajan has herself pointed out, the subject bristles with difficulty, and few authors have succeeded in expressing themselves clearly and consistently on it. I am in agreement with Mahajan on a great many points, and I suspect that she might have treated my argument with greater sympathy if I had kept my allergy for Hegel to myself.

Mahajan has done well to remind us of the historical context in which the idea of civil society emerged and developed. In its provenance, the idea is both western and modern. This does not mean that it cannot be adapted to the Indian context or to Indian needs. But in making that adaptation, we have to keep in mind the idea, and not just the phrase. The phrase has been used a little too promiscuously in recent discussions in India, and this has tended to empty it of all significant meaning.

I agree with Mahajan that state and civil society have to be viewed together, and that very little will be gained if we begin with a negative attitude towards the state. Unfortunately, a great deal of the recent enthusiasm for civil society in this country has been driven by a negative, if not a hostile, attitude towards the state, and, indeed, towards all public institutions. Nothing can be more destructive of civil society as I understand it than the idea that the best way to create and invigorate civil society is to empower the people at the expense of the state.

In both the earlier papers referred to above [see also Beteille 1998], I had made the case for including a third term, namely, citizenship, in discussions of the relationship between state and civil society. I was interested not so much in fixing a single and definite meaning to the term 'civil society' as in exploring the relations between state, citizenship and certain kinds of mediating institutions in the context of a democratic society and polity. As a sociologist, I sought to dwell in particular on the complex and differentiated nature of the mediating institutions. For that reason, and also because of limitations of space, I referred only briefly to state and citizenship, but that does not mean that I consider them to be unimportant. State and civil society are complementary, they are not alternatives. I do not take the view, as some seem to do, that the state can be put on the back burner, and civil society set to work in its place. The state performs certain indispensable functions, and if those are subverted or undermined, civil society as I understand it will wither in the bud. Although I have spent much of my time among anthropologists, the life of the segmentary tribe or the wandering band holds no special attraction for me.

I would like also to stress the importance of citizenship in the conception of civil society to which I subscribe. Just as state and civil society are complementary, so also are state and citizen. Furthermore, civil society cannot amount to very much where citizenship is absent or weakly developed. Civil society is a distinctively

modern phenomenon because citizenship itself is a modern idea and value. It is futile to look for civil society in India's ancient or medieval past because citizenship in the sense given to it in the Constitution of India – as in other modern constitutions – had hardly any place there.

I wish Mahajan had dealt a little more fully in her discussion of civil society with citizenship as a social, historical and legal category. I place special emphasis on citizenship because it is a neglected category of social analysis in this country. Unlike in Britain and to some extent the US, it has received very little systematic attention from social theorists in India, including those who write about civil society. The importance of universal citizenship is acknowledged in our Constitution, but it becomes evident as soon as we compare any modern society with societies of the past.

No doubt Mahajan recognises the great importance of the individual as an autonomous moral and legal agent in the development of civil society. To put it in her words, "legal recognition and protection of the natural rights of individuals transforms a political society into a civil society" (p 189). But I am not sure that her use of Hegel serves to make matters clearer. She says, with evident approval, that "Hegel defines civil society as a form of ethical life in which the subjective and the objective coexist in harmony" (ibid). I confess to being out of my depth in the face of such statements. Mahajan would have served her readers better by tracing the slow, tortuous and discontinuous processes through which the rights of citizenship have become enlarged in modern societies. We can never take the advance of citizenship for granted; historically, there have been setbacks as well as reversals.

The point I wish to stress, and with which I would expect Mahajan to be in agreement, is that citizenship is a historical and not a universal category. This point is not sufficiently well appreciated

by those who would like to go back to the Indian tradition to find a blueprint for an alternative form of civil society in our own medieval or ancient past. One can always find examples of benevolent sovereigns during whose reign the common people lived in peace, prosperity and amity; the paucity of reliable historical material has helped in creating and sustaining such images of the past. It is but one step from this for the dialectically agile to argue that it was in that past rather than in the strife-torn modern world that the subjective and the objective coexisted in ethical harmony.

To say that citizenship is a historical category is to indicate that it did not emerge all at once in its fully-articulated form. The evolution of citizenship has in the last 200 years taken many different turns in the different countries of the world, hence it has to be examined not only historically but also comparatively. Citizenship does not have exactly the same history or the same contemporary significance even in two adjacent European countries such as France and Germany. It would be unrealistic to expect it to have the same characteristics in India and in Europe which differ so greatly not only in their history but also in their social structure. It is for this reason that the philosophy of history has to be supplemented by comparative sociology if we are to make a proper assessment of the prospects of citizenship in our times.

The French Revolution marked a watershed in the emergence of citizenship as a socially acknowledged category. But it did not transform the subject into a citizen overnight. Not was it simply a question of the replacement of the monarchy by a republic. In Britain, where the state underwent a more gradual transformation, citizenship evolved over a longer period of time with changes not only in the laws but also in customs, sentiments and attitudes. The point I wish to stress here is that the emergence of citizenship and, with it, of civil society, depends on changes not only in the distribution of power but also in ideas, beliefs and values. A new kind of state cannot conjure a civil society into existence if its emergence has not been accompanied by the emergence of new habits of the heart and the mind. Politics alone can never change a society fully; a certain kind of state is a necessary accompaniment of civil society, but it is not sufficient.

In a classic study entitled 'Citizenship and Social Class', T H Marshall (1977) had traced the evolution of citizenship in Britain from the middle of the 18th to the middle of the 20th century. He saw this

evolution as consisting basically of the progressive expansion of certain rights: civil, political and social. Through this expansion, the very idea of status underwent a transformation: status came to be defined in terms of the equal rights of citizenship in place of the hierarchical gradation of estates. To repeat, this was a long and uneven development that did not follow the same course everywhere.

Citizenship and caste are antithetical principles. It is difficult to see how we can make a case for the presence of citizenship in traditional Indian society, unless we are prepared to argue that caste had little or no significance in that society, that it was indeed a colonial construction. The idea of citizenship was introduced into India by the British, but, naturally, they were not inclined to press too strongly the claims of equal citizenship between themselves and their native subjects; this irony was brilliantly expressed by Nirad C Chaudhuri in the dedication of his *Autobiography*. It was only after independence that the rights of equal citizenship could be clearly and unequivocally inscribed in the Constitution of India. The equality provisions of the Constitution – equality of status and of opportunity – define the rights of Indians as citizens. Those provisions mark a radical break with the Dharmashastra by which the laws of the Hindus had been regulated for 2,000 years.

If we agree that the rights of citizenship are the rights of individuals, we must recognise that the creation of citizenship, and by extension of civil society, is an uphill task in a country where collective identities predominate over individual ones. I would argue that the greatest threat to civil society in India today comes from the intrusion of collective identities into domains that ought to be governed by the rights and obligations of individuals. Our Constitution assigns pre-eminence to the individual as a citizen, but our politicians, legislators and even judges seek to advance the claims of castes and communities in the name of social justice.

The politics of reservations – reservations for the backward classes and reservations for women; political reservations and reservations in education and employment – is threatening to transform our public domain into a checkerboard of quotas. While assigning primacy to the claims of the individual as citizen, the Constitution did make some special – and transitory – provisions for certain severely disadvantaged sections of society. Those provisions have been greatly extended, especially in the last 20 years, and they now threaten to 'eat up' what is due to

each individual as a citizen. What is more, matters of policy have come to be increasingly redefined as matters of right. Collective identities based on caste and community have been given a new lease of life, and this is undoubtedly a setback to the development of civil society as I understand it.

Mahajan has ascribed to me the view that the state (along with religion) is the enemy of civil society; I must have expressed myself very badly indeed to have led her to form that opinion. I have consistently maintained that civil society can be understood only in the context of the threefold relationship between (i) state, (ii) citizenship, and (iii) mediating institutions. I have also pointed out that not every kind of state, but only the modern constitutional state is relevant to the development of civil society. What I now wish to stress is the ambivalent nature of the relationship between state and civil society. The state can play a constructive role in the evolution of civil society, as it has done in Britain and the Netherlands; it can also play a destructive role, as it did in Germany and the Soviet Union. These are matters for empirical enquiry through the historical and comparative methods; they cannot be judged in advance by any philosophy of history.

I agree with Mahajan that civil society requires for its sustenance a body of rational impersonal rules, and that only the state can be the ultimate guarantor of those rules. The 'withering away of the state' is an ideologue's fantasy that has exacted a very heavy price in human suffering in our century. But no matter what one may think of the state in principle, one cannot escape the responsibility of judging each actually-existing state on merit. And when one does that, one is forced to the conclusion that some states have contributed very negatively to civil society.

To Mahajan's broad historical account of the idea of civil society from the end of the 17th century onward, I would like to add a footnote on a tiny segment of that history in our time. In the eighties of the present century, a group of British sociologists with left sympathies became increasingly interested in the idea of civil society out of their anxiety over developments in eastern Europe. They realised that in that part of the world the state had crushed the liberties of the citizen and the autonomy of institutions, and wondered if their own bourgeois-liberal society had been so bad after all. Some of them were moving to the conclusion that civil society

was perhaps a unique feature of western democratic regimes.

In India, we do not have a totalitarian state, and have never had one. Even the colonial state, for all the restraints it imposed on its subjects, can hardly be described as totalitarian. Nevertheless, the Indian state has been attacked persistently for expanding and abusing its powers. It is strange but true, that in the fifties, sixties and seventies left intellectuals never missed an opportunity to attack the Indian state for its undemocratic or even anti-democratic ways, while holding up, first, the Soviet Union, and, then, the People's Republic of China as models of real democracy. To add to that, our intellectuals have made a habit of demanding that the state provide education and employment to everyone, while at the same time taking it to task for its expansionist tendencies.

Without discounting in any way the dangers of totalitarianism, I would argue that in India the real threat to civil society – or what little there is of it – comes not from totalitarianism, but from competitive populism. Competitive populism has become endemic, not only in our political life, but also in our intellectual life. I suspect that Mahajan is aware of its danger, but has chosen to pass lightly over it.

For civil society to be viable, there has to be respect not only for the authority structure of the state, but also for the authority structures of all public institutions. These authority structures are now under continual attack from populist intellectuals. It is true that no public institution should be beyond public scrutiny and public criticism. Indeed, reasoned criticism is essential for the health and well-being of civil society, and it was the suppression of such criticism in the countries of eastern Europe that signalled the decline and failure of civil society there. But reasoned criticism is different from an intellectual stance that attacks every establishment on principle. In India, even members of the establishment, such as cabinet ministers, Supreme Court judges and university vice-chancellors adopt anti-establishmentarian postures almost by habit. Populist demagoguery weakens civil society as surely as reasoned criticism strengthens it.

I hope I have said enough to satisfy Mahajan about the importance I assign to the state. No doubt I myself gave occasion for some misunderstanding by drawing the distinction between state and civil society too sharply, and, more importantly, by failing to dwell sufficiently on the fact that the state is itself an institution. For many political theorists, the state is not

only an institution, it is the pre-eminent institution. While recognising fully the great significance of the state as an institution, I am not sure that I am prepared to assign pre-eminence to it, or to any one of the major institutions of society to the exclusion of any other.

There is no need to assign pre-eminence to the state in order to treat it separately, for analytical purposes, from the other institutions of society. The framework in which I view the relationship between state, citizenship and mediating institutions is that of the division of labour in Durkheim's sense of the term, or of the differentiation of societies in Luhmann's sense [Durkheim 1984; Luhmann 1982]. In this framework, differentiation and integration are not antithetical but complementary processes. This does not mean that differentiation is always or inevitably accompanied by integration, but only that in a long-term evolutionary perspective, societies that are more differentiated are likely, but not guaranteed, to be better integrated than those that are less differentiated.

The separation of powers and functions between legislative, executive and judicial institutions is but one aspect of the differentiation of societies referred to above. It is not necessary to assign pre-eminence to any one of the three institutions in order to argue that their differentiation and integration enhances the well-being of the polity. On a broader scale, the differentiation between the state and the other major institutions of society contributes to the overall social well-being, assuming of course that there is some degree of integration among the differentiated institutions. Such a perspective comes naturally to someone who assigns primacy to society over the state, although it may not find favour with those for whom the state is the supreme institution.

Mahajan's annoyance with what she regards as my scepticism about the state leads her to draw an unexpected inference about the implication of my argument. She says at p 1195, "Even though Beteille is interested in protecting the autonomy of open and secular institutions in society, his argument lends support to the communitarian perspective that has scant respect for the latter". The inference is more surprising than convincing. Just as recognising the significance of the state does not make me a statist, so also recognising the importance of the community should not make me a communitarian. I am in fact no less allergic to com-

munitarianism than I am to statism. I am a plain old-fashioned liberal who values the autonomy of institutions as well as the autonomy of individuals, and fears the threats to the former from excessive emphasis on the state and to the latter from excessive emphasis on the community.

In the formulation on whose basis Mahajan has made her inference, I introduced the subject of mediating institutions with the following words; "Every society has its own internal arrangements: its groups, classes and communities; its associations, organisations and institutions; and its networks of interpersonal relations, linking the different parts to each other and to the whole" [Beteille 1996b:14]. I have made similar observations about what stands between the individual and the wider society at a number of places. In the statement quoted above, I divided this vast terrain into three broad sectors; someone else may divide it in a somewhat different way. But every sociologist has to take note of the highly differentiated nature of the terrain, particularly in a society such as ours.

The failure to distinguish between institutions and communities would be as grave an error in a sociologist as the failure to distinguish between classes and communities. To be sure, a class may sometimes acquire the character of a community, but that would be a limiting case and not a typical one; the same holds true between institutions and communities. My essay was not designed to cover the whole of the terrain that lies between the individual and the wider society, but only to explore the significance of institutions, and that too of institutions of a particular kind, in the working of contemporary Indian society.

I sought to emphasise the diversity of open and secular institutions in full awareness of the presence of institutions of other kinds; and my emphasis has to be seen in light of the value I attach to diversity in social arrangements in general. It has often been said that diversity was greatly valued in traditional Indian society. There was indeed much variety in material culture, in social arrangements and in religious beliefs and practices. But the diversity that was tolerated or even encouraged in the past was organised hierarchically, and it left little room for the freedom of individual choice for men, and especially for women.

The new institutions about which I wrote seek to organise diversity on a different basis, so that the fate of the individual, whether man or woman, is not determined at birth, and his or her freedom to move

from one social position to another is expanded. They are quite different from family, caste and community, and I do not see why my advocacy of open and secular institutions should lead me to align myself with communitarians. But, then, what should we do with the communities that still survive and will undoubtedly continue to survive in our society, as in other societies? As a sociologist, I do not feel at all comfortable with the idea of a civil society, or of any society of the future, that sets itself intransigently against the community as such.

One does not have to be a communitarian in order to appreciate the salience of communities in human life, whether in India or elsewhere. To be sure, ties of kinship and community should not be allowed to intrude into the kind of open and secular institutions on whose health and well-being so much depends. Those institutions need to be insulated as far as possible from the claims arising from primordial attachments. But it is not consistent with the liberal spirit to seek to do away with such attachments altogether; nor, from the sociological point of view, is it very realistic.

Mahajan writes, again at p 1195, "Indeed, Beteille sees both state and religious institutions as enemies of civil society". I believe I have said enough to show that I do not consider the state to be the enemy of civil society. I now wish to add that I do not consider religion to be its enemy either, although the relationship of civil society to religion is different from its relationship to the state. If I value institutions of a certain kind, it does not follow that I am opposed to institutions of all other kinds. Although, personally speaking, I am religiously unmusical, I consider it profoundly unsociological to treat religion as an enemy of civil society or of society in the broad sense of the term; it is not only unsociological but also illiberal to treat religion with hostility or contempt.

* * *

I realise that the scattered observations I have made above and elsewhere do not add up to a clear and consistent definition of civil society. Such a definition would be invaluable in developing a systematic approach to the subject, but, unfortunately, none is readily available. Much of the contemporary discussion of the subject in the west is too narrowly focused on specific features of contemporary western society for us to be able to apply its conclusions directly to the Indian case. But we can ignore that discussion only at our own cost. In any case, it is a little too

late for us to invent our own conception of civil society, untainted by the western historical experiences; we are too heavily compromised by our engagement with the modern world for that to be a serious option. The problem with the discussion of civil society in contemporary India is not that the definitions are wrong, but that the arguments are so often either inconsistent or vacuous.

Mahajan has raised an anguished question about the fate of democracy. Those Indian authors whose views on civil society she has sought to contest seem no less anguished about the fate of democracy than she seems. I do not know a single person who would advocate the case for civil society at the cost of democracy. What then accounts for the disagreement over civil society? I believe that at the root of the disagreement over what should be advocated in the name of civil society lies the difference between two conceptions of democracy, the constitutionalist and the populist. My understanding is that in the last 50 years, and particularly since 1977, the constitutionalist conception of democracy has steadily lost ground to the populist conception, and that therefore those who seek to make the case for civil society from the constitutionalist point of view will have to sail against the wind.

When India became independent after a long period of colonial rule, there was understandable optimism about the prospects of all-round economic and political development through constitutional means. But India's archaic and ponderous social hierarchy proved far more resistant to modernisation than had been expected, and modernisation itself created new and unforeseen social problems. Economic growth was slow, and the fruits of that growth continued to be unequally distributed among individuals and among communities. Democratic politics, far from dissolving the boundaries between castes and communities, magnified the awareness of those boundaries. As more and more laws came to be enacted, their in-

ability to contend with the obduracy of custom became more and more apparent.

The emergency and its aftermath brought about a great change not only in India's political life, but also in its intellectual life. The politics of caste and community became legitimised in the name of social justice. Such open and secular institutions as had begun to take their faltering steps in an uncongenial environment came under severe attack for being unrepresentative, elitist and against the real interests of the people. Politicians began to attack and undermine the very system to which they owed their sustenance, and many intellectuals who were modernised to their fingertips began to attack modernity itself.

Constitutional democracy depends upon respect for rules and procedures, and for the gradations of legitimate authority. Populism represents all established authority as fortifications against the oppressed and the exploited, and all rules and procedures as instruments of vested interests. It has little regard for the functional requirements of the kind of open and secular institutions about which I have written. It seeks instead to promote democracy through the direct empowerment of the people, and especially of disadvantaged, disesteemed and marginalised communities. Populism is at once emancipationist and antinomian in its appeal.

Current Issues of Employment Policy in India

Ajit K Ghose

The growth performance of the Indian economy, though not spectacular, has been decent by the standards of developing countries. But growth has failed to improve employment conditions in the country even though the rate of labour force growth has so far been quite low. It is hardly surprising that problems of unemployment and underemployment worry policy planners of today as much as they did Mahalanobis at the time of formulating the Second Five-Year Plan. The rate of labour force growth is currently accelerating and is expected to remain high for quite some time to come. If the past patterns continue, the country will soon be confronted with an employment crisis. This paper analyses the past experience in an effort to identify the problems that must be urgently addressed. It then proposes a few ideas for future policy.

I Introduction

A BASIC assumption underlying development planning in India was that shortage of capital goods in relation to employable persons constituted the fundamental constraint on growth in the country. Not surprisingly, therefore, the planners made no attempt to define an independent employment strategy; they chose to focus on economic growth which was viewed as essential for improving employment conditions.¹ Of course, efforts were made to take account of the employment concerns in designing growth strategies. The Mahalanobis model, which guided economic policy in India till recently, sought to reconcile the need to generate non-agricultural employment at a rapid rate with the chosen course of import substitutive industrialisation by formulating a strategy of 'walking on two legs'. It was explicitly recognised that the proposed emphasis on capital goods industries would imply a slow growth of employment in the emerging modern sector and hence would do little to alleviate the already serious problems of unemployment and underemployment. From this recognition emerged the idea of relying on traditional as well as modern small-scale industries, which had the virtue of being labour-intensive, for meeting the growing demand for consumer goods.² Support programmes for traditional industries and a policy of reservation of products for modern small-scale industries, therefore, were regarded as essential components of the growth strategy. Persistence of mass poverty forced a rethink only later (in the mid-seventies) and some special programmes for promoting self-employment and casual wage employment were put in place by the end of the seventies.

In retrospect, it is easy to see what the Indian approach implicitly ruled out. First, the possibility of combining more labour

with the existing capital stock to increase output in the modern sector was assumed away. This implied a rejection of Arthur Lewis's idea³ that surplus labour in agriculture constituted a source of investible surplus for the modern sector. Second, labour and education policies were not assigned any significant role in dealing with problems of unemployment and underemployment. These policies, therefore, came to be perceived essentially as 'welfarist'. Third, labour market dualism was not viewed as something undesirable. It was fairly obvious that the industrialisation strategy adopted could not but strengthen labour market dualism, but this was never even mentioned in discussions and debates. Policy makers also remained blissfully unaware of the fact that the 'welfarist' policies relating to labour and education were also having the effect of strengthening labour market dualism.

That the past policies have not been particularly successful is best illustrated by the fact that problems of unemployment and underemployment worry planners and policy-makers of today as much as they did Mahalanobis at the time of formulating the Second Five-Year Plan. It is now believed that a strategy of export-oriented industrialisation would provide a solution to the problems by accelerating the rate of economic growth and by stimulating growth of relatively employment-intensive production sectors. But this is not much more than a belief; no clear view of either the problems or the effectiveness of the new strategy in dealing with the problems in fact exists. It is noteworthy, moreover, that once again labour and education policies do not figure prominently in discussions on employment.

Against this backdrop, the present paper reviews the evolution of employment conditions in India over a period of 16 years. Apart from providing an assessment of the achievements and failures of past policies, such a review also helps in

isolating the problem areas, which deserve attention from policy makers at this juncture. It is hoped, moreover, that the findings and observations presented in the paper will stimulate debates in both academic and policy circles.

II The Database

There are two main sources of statistical data on employment and unemployment in India. The decennial population censuses generate, apart from population estimates and demographic data, useful information on the working population in the country. However, an operation as large as the population census in India cannot be expected to generate reliable data on detailed aspects of employment and unemployment for the simple reason that intensive enquiries at the level of individual respondents cannot be carried out on such a massive scale. For perfectly understandable reasons, the decennial censuses do not generate any data on unemployment and underemployment; they also seriously underestimate female workforce. The data available from the quinquennial sample surveys on employment and unemployment, conducted by the National Sample Survey Organisation, do not suffer from these limitations. But these surveys, the first of which was conducted in 1972-73, generate reliable estimates of percentages and proportions rather than of absolute numbers. For building the database for this paper, therefore, population estimates available from the decennial censuses have been combined with the data on employment and unemployment available from the quinquennial sample surveys. The period covered in the paper is 1977-78 to 1993-94. This means that four of the quinquennial surveys – those pertaining to 1977-78, 1983, 1987-88 and 1993-94 – have been used.

CHART 1: GROWTH (PER CENT PER ANNUM) OF POPULATION AND LABOUR FORCE

Source: Table 1.

The concepts and definitions used in the quinquennial surveys are designed to capture the complexities of the employment situation in India. Three different concepts are used to derive estimates of labour force, employment and unemployment. The usual status concept has a reference period of one year and persons working during at least a part of the reference period (the employed) and those not working but seeking or available for work during the major part of the reference period (the unemployed) are regarded as being in the labour force. The employed are subdivided into two categories: those working for the major part of the reference period are regarded as employed according to usual principal status and those working for only a minor part of the reference period are regarded as employed according to usual subsidiary status. The employed are also classified by type of employment (self-employment, regular wage employment and casual wage employment) and by sector of employment on the basis of time-use criterion.⁴ The other two concepts – current weekly status and current daily status – have a reference period of one week. Persons who worked or who did not work but were seeking or available for work even for one hour during the reference week are regarded as being in the labour force according to current weekly status. The estimates based on current daily status concept enumerate all the days of employment and unemployment of those in the labour force (i.e., those who were either working or were seeking or available for work during the reference week).

Although the quinquennial surveys provide estimates of employment and unemployment based on all three concepts, much of the supplementary information is provided only for those in the labour force on the usual status criterion. The main advantage of having three sets of estimates is that the three measures of unemployment together provide, in principle, a fuller view of the unemployment problem in the Indian context. Conceptually, the usual status estimate measures chronic unemployment, the current weekly status estimate measures current unemployment

(chronic plus temporary) and the current daily status estimate gives a composite measure of chronic unemployment, temporary unemployment and under-employment.

This paper uses only the estimates based on the usual status concept. One reason is that, as already mentioned, much of the supplementary information is available only for the usual status labour force. A more important reason is that, in the context of India, estimates of unemployment – irrespective of whether they are based on usual status or current weekly status or current daily status criterion – are of dubious value. It is well known that many people are reluctant to report themselves to be seeking or available for paid work when they know such work to be unavailable. Under the circumstances, all three measures underestimate the magnitude of unemployment in varying degrees. Thus analytical benefits to be derived from the use of the three measures of unemployment are far from clear. For this reason, attempts are made in this paper to construct alternative measures of unemployment and underemployment by using the data based on the usual status concept.

While using the estimates based on the usual status concept, Indian researchers generally include persons employed according to usual subsidiary status among

the employed. In this paper, however, the category 'employed' is so defined as to include only those who are employed according to usual principal status. As explained later, subsidiary status workers are more legitimately treated as unemployed than as employed.

Though the quinquennial surveys distinguish between regular and casual wage employment, they do not distinguish between regular wage employment in the organised sector from that in the unorganised sector. Yet the distinction is important for analytical purposes. Estimates of regular wage employment in the organised sector, which in India is so defined as to roughly incorporate all establishments with 10 or more employees, are available from the ministry of labour. These estimates, it is assumed, can be used in combination with the estimates generated by the quinquennial surveys without introducing serious distortions. Since the quinquennial surveys provide estimates of all regular wage employment, estimates of regular wage employment in the unorganised sector can be derived as residuals.

III The Labour Force

Between 1977-78 and 1993-94, India's population increased from 639.1 million to 902.8 million implying a growth rate of 2.2 per cent per annum while its labour force grew from 276.3 million to 385.5 million implying a growth rate of 2.1 per cent per annum. Thus, labour force grew at a slower pace than population. These average growth rates over a 16-year period, however, hide some interesting patterns which emerge when sub-periods are

TABLE 1. POPULATION AND LABOUR FORCE

	1977-78	1983	1987-88	1993-94
All				
Population (millions)	639.1	713	793.5	902.8
Growth rate (per cent)		2.2	2.2	2.2
Labour force (millions)	276.3	305.7	338.3	385.5
Growth rate (per cent)		2	2.1	2.2
Participation rate (per cent)	43.2	42.8	42.6	42.7
Male

Growth rate (per cent)		2.2	2.2	2.2
Labour force (millions)	183.2	202.3	224.2	260.7
Growth rate (per cent)		2	2.1	2.5
Participation rate (per cent)	55.4	54.8	54.5	55.6
Female				
Population (millions)	308.4	344	382.1	433.7
Growth rate (per cent)		2.2	2.1	2.1
Labour force (millions)	93.8	102.9	114.1	124.8
Growth rate (per cent)		1.9	2.1	1.5
Participation rate (per cent)	30.4	29.9	29.9	28.8
Share of females in total labour force (per cent)	33.9	33.7	33.7	32.4

Source: Table 2

considered: the rate of population growth remained stable throughout the period while the rate of labour force growth was accelerating and the two rates became equal towards the end of the period (Chart 1). Thus, in terms of demographic transition, the Indian economy seems to have reached a phase where population growth is about to begin to decelerate and labour force growth is about to exceed population growth. It can be safely predicted that labour force growth will continue to accelerate for quite a few years to come and will remain higher than population growth for an even longer period. Exactly how many years it will take for labour force growth to reach its peak and at what level it will peak are matters that require detailed investigation.

Some of the changes underlying the above developments are of considerable interest. While the share of the working-age (15-59 years) population in total population was rising steadily, the labour force participation rate of this age-group was actually declining (Chart 2). Between 1977-78 and 1993-94, the share of working-age population in total population increased from 52.7 per cent to 57.3 per cent, but the labour force participation rate of the group fell from 71.7 per cent to 66.9 per cent. The labour force participation rate of the non-working-age population was also declining during the same period; it fell from 11.5 per cent in 1977-78 to 10.1 per cent in 1993-94. Additionally, of course, the share of non-working-age population in total population has itself been declining. In consequence of these changes, the absolute size of the non-working-age labour force remained virtually stable between 1983 and 1993-94.

Two important points emerge from these facts. First, the observed acceleration in labour force growth occurred wholly because of changes in the age-structure of the population: working-age population has been rising at a faster rate than total population. Second, certain behavioural changes actually blunted the pace of acceleration in labour force growth: had

the participation rate for each age group remained unchanged, for example, the acceleration resulting from the changes in the age-structure would have been much sharper. Because the participation rates for different age groups declined, the overall worker-population ratio did not rise as would normally be expected; in fact it showed a feeble tendency to decline.

Why did the participation rates decline? In the case of the working-age population, the decline has been associated with expansion of education. This fact has prompted several researchers to argue that the declining participation rate of the working-age population is quite simply explained by the fact that attendance in educational institutions by persons in 15-29 age-group has been steadily rising and that the declining participation rate should, therefore, be regarded as a positive development.⁵ But this argument is only partially valid; there is in fact more to the story.

A close scrutiny reveals that, in the case of the working-age population, the relationship between the participation rate and the level of education can be represented by an elongated U-shaped curve; participation rate first falls as the level of education attained by a population group rises but then rises sharply for people with more than 12 years of education (Chart 3).⁶ However, given that the proportion of

population with more than 12 years of education is still very small (just 4.4 per cent in 1993-94), the elongated U-shaped curve can effectively be treated as a downward sloping curve. This immediately implies that rising average level of education of the working-age population has a depressing effect on the worker-population ratio for the group as a whole.

How is the elongated U-shaped curve to be explained? Detailed investigations are required to adequately answer this question and only some hypotheses can be offered here. It is fairly obvious that the relationship cannot really be explained in terms of attendance in educational institutions. If a person with eight years of education, who had presumably stopped pursuing education at the age of 12, is not in the labour force even when he/she is more than 15 years old, then there must be reasons other than pursuing education. Attendance in educational institutions can be a reason for staying outside the labour force only for those pursuing university education, but the participation rate for this group is in fact higher than that for all other groups including the illiterate.

There probably are two factors, which explain the elongated U-shaped curve. First, education is a luxury good in India; ability of young people to pursue education depends very much on the assets and incomes of their families. Thus, the level of educational attainment is actually an indicator of wealth and income. This means that the higher the level of educational attainment, the weaker is the compulsion to be in the labour force. Second, given the prevailing economic and socio-cultural context, education tends to incline young people to aspire after employment in non-manual occupations in the organised sector. If employment growth in the organised sector is not rapid or appropriate enough to fulfil such aspirations, many young people with some education, end

TABLE 2: WORKING-AGE LABOUR FORCE

	1977-78	1983	1987-88	1993-94
All				
Percentage share of working-age population in total population..	52.7	53.0	55.4	57.3
Labour force participation rate (per cent) of working-age population	71.7	69.4	68.0	66.9
Male				
Percentage share of working-age males in all males	52.2	53.0	54.4	56.7
Labour force participation rate (per cent) of working age males	92.6	90.2	88.6	88.0
Female				
Percentage share of working-age females in all females	53.1	54.2	56.5	58.0
Labour force participation rate (per cent) of working-age females	49.7	47.5	46.7	44.7

Note. Working age is defined as 15-59 years

CHART 3: LABOUR FORCE PARTICIPATION RATE (PER CENT) OF POPULATION AGED 15 YEARS OR MORE BY YEARS OF EDUCATION, 1993-94

Source: Table 4

up as discouraged workers and eventually withdraw from the labour force. This is likely to be particularly true of those with middle-level education, which does not equip young people with any particular job-oriented skills.

As for the non-working-age population, the observed decline in the participation rate essentially reflects the declining participation of children in the labour force. The labour force participation of older people (those aged 60 years or more) in fact showed a tendency to rise, but children dominated the non-working-age population.

IV Employment

In analysing employment growth, the first thing that comes to notice is that, for the entire period, the rate of employment growth -- at 2.1 per cent per annum -- was exactly equal to that of labour force growth. In broad terms, therefore, employment growth kept pace with labour force growth. It is true that while labour force growth was steadily accelerating, employment growth was fluctuating. But the fluctuations can be easily explained. Drought conditions depressed employment in agriculture and hence in the whole economy in 1987-88; and subsequent recovery accelerated employment growth in both agriculture and the economy as a whole.⁷ Such weather-induced fluctuations can be legitimately ignored for purposes of studying trends. If 1987-88 is left out of account, it can be concluded that employment growth was accelerating just as labour force growth was accelerating.

However, the fact that employment growth kept pace with labour force growth does not necessarily imply that the Indian economy performed well in terms of generating employment. It must be recognised that something like a 'Say's Law of Employment' holds good in an economy such as India's: supply of labour creates its own demand to a significant extent when self-employment and casual

wage employment predominate. This is also why too much should not be read in the fact that the output elasticity of employment at the level of the aggregate economy remained stable throughout the period so that the acceleration in employment growth appears to have resulted from the acceleration in economic growth. Closer inspection shows that the aggregate employment elasticity remained stable basically because the employment elasticity in agriculture remained stable (given

that agriculture still accounts for bulk of the employment in the economy); it actually fell both in industry and in services during 1987-94 and the decline in industry was particularly sharp. The observed stability of the aggregate employment elasticity, therefore, needs to be viewed with due suspicion since the 'Say's Law of Employment' is far more relevant for agriculture than for any other sector.

For evaluating changes in employment conditions in this setting, it is useful to consider two schematic characterisations of the nature of linkage between economic growth and employment growth in a typical developing economy. Two assumptions about initial conditions in such an economy are involved: first, that there is a sizeable volume of 'surplus labour' (which can be interpreted to mean the existence of a large volume of low-intensity, low-productivity employment) in agriculture and, second, that labour productivity in the non-agricultural sector is much higher than that in the agricultural sector.

TABLE 3 NON-WORKING-AGE LABOUR FORCE

	1977-78	1983	1987-88	1993-94
A Child labour force

Note: A child worker belongs to the age-group '5-14 years' and an older worker belongs to the age-group '60 or more years'.

The first schematic construction is the well known Lewis framework.⁸ Growth process in this framework is envisaged as involving, primarily, transfer of 'surplus labour' from agriculture into productive employment in non-agriculture. As such transfers occur, average labour productivity in agriculture rises and that in non-agriculture falls. But so long as labour productivity in non-agriculture remains higher than that in agriculture, labour productivity in the economy as a whole rises as a result of labour transfers. Growth occurs and employment conditions improve as workers move from low-productivity agricultural activities to high-productivity non-agricultural activities. The process reaches a turning point when labour transfers have occurred to such an extent as to equalise marginal labour productivities across sectors. Beyond this point, labour transfers cannot occur and labour productivity in the aggregate economy cannot grow except in consequence of technological changes, growth of capital intensity and accumulation of human capital in each of the sectors.

The Lewis process can be contrasted with another hypothetical process wherein labour productivity rises only (or basically) in the non-agricultural sector through accumulation of capital (both physical and human) and technological change. In the extreme case, no labour transfers occur and average labour productivity in agriculture steadily declines even while that in the aggregate economy rises. In less extreme cases, some labour transfers occur and labour productivity in agriculture shows marginal improvements; but as growth of labour productivity is faster in non-agriculture than in agriculture, there is no definable turning point and 'surplus labour' becomes a permanent feature of agriculture. Employment conditions deteriorate as the majority of workers remain engaged in traditional activities where the already low labour productivity tends to deteriorate further.

A comparison between these two hypothetical processes brings out the important point that rapid inter-sectoral labour transfers and tendency of convergence of sectoral labour productivities are the true indicators of improvement in general employment conditions in a developing economy. When judged by these indicators, general employment conditions in India actually appear to have been deteriorating even though employment growth apparently kept pace with labour force growth. The sectoral distribution of employment changed in the right direction but the pace of change was slow. Over a 16-year

period (1977-78 to 1993-94), agriculture's share in total employment fell by less than 8 percentage points – from 69.2 per cent to 61.5 per cent, while its share in GDP fell by 10 percentage points – from 40 per cent to 30 per cent. Direct estimates of labour productivity show very clearly that it grew at a much faster rate in non-agricultural sectors than in agriculture where it was little more than stagnant. Intersectoral labour transfers played virtually no role in increasing labour productivity in the economy as a whole and labour productivities in agriculture and non-agriculture showed a strong tendency towards divergence.⁹

The conclusion that general employment conditions may have been deteriorating is also suggested by the evidence on changes in the quality of employment. The main indicator of quality of employment is the distribution of employment by what is known as 'employment status'. A worker in India can have one of the following four types of employment: regular wage-employment in the modern or organised sector of the economy, regular wage-employment in the unorganised or informal sector of the economy, self-employment (mostly in the unorganised sectors), and casual wage-employment (which can be in either the organised or the unorganised sector). Quality-ranking of these different types of employment is neither difficult nor particularly controversial. Regular wage-employment in the organised sector – practically the only type covered by the existing state-sponsored labour protection system – must be ranked best among the available types of employment. Self-employed persons constitute a heterogeneous group with a wide range of productivity and income levels. However, it is perhaps appropriate to rank the average self-employed second only to the average regular employee in the organised sector. Regular wage-employees in the unorganised sector enjoy the benefit of a regular income (which may even equal the income of an average self-employed) but are not covered by the existing labour protection system. The main difference between the self-employed and the regular wage-employee in the unorganised sector lies in the fact that the former enjoys greater job security than the latter. For this reason, it is appropriate to rank the self-employed above the regular wage-employee in the unorganised sector. Casual wage-labourers have to search for employment on a daily basis and, if and when employed, receive a wage, which is best conceptualised as an institutional variable. Thus their employment and

income levels are uncertain and, of course, they do not derive any benefit from the existing system of labour protection. For these reasons, casual wage-employment is generally regarded as the worst of all available types of employment.¹⁰

As regards the actual changes in the distribution of employment by status, four broad tendencies can be discerned from the available data. First, the share of self-employment in total employment has shown a tendency to decline. The tendency is observed both in the aggregate economy and in the major production sectors except 'services' where, somewhat surprisingly, self-employment seems to have gained in importance. Second, the share of 'regular wage-employment in the organised sector' in total employment has shown a tendency to decline. The tendency is observed both in the aggregate economy and in the major production sectors except agriculture where it has always been rather insignificant. Third, the share of "regular wage-employment in the unorganised sector" in total employment has shown a tendency to increase in non-agriculture. In agriculture, however, this shows a tendency to decline and, consequently, no particular trend are discernible at the level of the aggregate economy.¹¹ Finally, the share of casual wage-employment in total employment has shown a tendency to rise. The tendency can be observed both in the aggregate economy and in the major production sectors except 'services'.

On the whole, therefore, high-quality employment has shown a general tendency to decline in importance and low-quality employment has shown a general tendency to increase in importance. Agriculture, moreover, remains the principal reservoir of surplus labour (i.e. of low-quality employment) though the process of inter-sectoral labour transfers seems to have led to the emergence of surplus labour in other sectors as well; casual employment, for example, has been growing in industry and self-employment has been growing in services.

These facts clearly suggest that the overall quality of employment has been deteriorating. The point can be made a little more explicitly. For ease of comparison, both cross-sectional and inter-temporal, quantitative weights can be assigned to different types of employment as follows:

Regular wage-employment	
in the organised sector	(w ₁) : 1.00
Self-employment	(w ₂) : 0.80
Regular wage-employment	
in the unorganised sector	(w ₃) : 0.65
Casual wage-employment	(w ₄) : 0.50

CHART 4: EMPLOYMENT QUALITY INDEX

Source: Table 9.

An 'employment quality index' (EQI) can then be constructed as follows:

$$EQI = w_1 \cdot e_1 + w_2 \cdot e_2 + w_3 \cdot e_3 + w_4 \cdot e_4$$

where e 's represent the shares of various types of employment in total employment. EQI assumes the maximum value of 1 when all types of employment can be regarded as equivalent to 'regular employment in organised sector' and the minimum value of 0.5 when all types of employment can be regarded as equivalent to casual wage-employment. The weights chosen here, of course, are wholly arbitrary. Obviously, it would be more appropriate to derive the weights empirically; for example, they could be based on available estimates of average earnings of different types of workers. However, the rankings matter more than the specific values of the weights; so long as the rankings remain unaltered, small changes in the specific values of the weights would not substantially alter conclusions about cross-sectional differences or intertemporal changes.

Estimates of EQI suggest two main conclusions. First, the quality of employment has been and remains the highest in 'services' and it has been and remains the lowest in agriculture. Agriculture's traditional role as the principal reservoir of surplus labour remains unchanged.¹² Second, during the period 1977-78 to 1993-94, the quality of employment deteriorated in the aggregate economy (Chart 4) as well as in each of the three sectors, though the deterioration was not very significant in 'services'.

The conclusion that the quality of employment has been deteriorating appears, at first sight, to be at odds with the finding, by now well-established, that the incidence of poverty declined significantly during the same period.¹³ But the inconsistency is more apparent than real. The decline in the quality of employment (as measured by EQI) only indicates that the weight of relatively low-quality employ-

ment in total employment increased. This does not rule out the possibility that absolute wages or earnings in even the lowest-quality employment may have increased which is all that is required for poverty to decline.

There is indeed evidence to suggest that real wages and earnings of casual labourers increased at a rather impressive rate. The real daily wage rate for male casual labourers in agriculture, for example, increased at an annual rate of 2.9 per cent during the 16-year period 1987-88 to 1993-94; for the females, the increase -- at 3.1 per cent per annum -- was even sharper.

It must be noted, however, that in spite of the impressive growth, the wage rate for casual labour in agriculture remains much below what might be called the poverty-line wage rate -- the wage rate which would allow the members of a typical casual labour household to have an expenditure level just equal to the official poverty line.¹⁴ Assuming that a typical casual labourer supports two non-earning dependents and finds work for 20 days in a month, the poverty-line money wage rate in rural areas for 1993-94 can be estimated as Rs 31.19 per day while the actual money wage rates in the same year were Rs 20.85 for males and Rs 14.88 for females. The money wage rates for casual labour in urban non-agriculture in 1993-94 (Rs 33.79 for males and Rs 19.51 for females), though substantially higher than those in agriculture, were also much below the estimated poverty-line money wage of Rs 43.23 per day. Indeed, it can be easily checked that even if a typical casual labourer found employment for 26 days in a month (which can be regarded as full-time employment) at the prevailing wage rate, his/her family would still be in poverty.

Thus, it is clear that even the impressive wage growth could not have enabled those who depend, primarily or wholly, on casual labour for a living to move out of poverty. However, some casual labour households

have other sources of income (such as self-employment) and some others have lower than typical dependency ratios. The wage growth could conceivably have helped such households cross the poverty threshold.

It is an intriguing fact, though, that the real daily wage rate for casual labour in agriculture increased at a faster rate than both the labour productivity in agriculture (which grew at only 1.3 per cent per annum) and the real daily wage rate for casual labour in urban non-agriculture (which grew at 1.7 per cent per annum). In fact, rural wages in general increased faster than urban wages. As rural casual labourers belong to the core group of poor, identification of factors underlying the impressive growth in their wages would obviously help design interventions for poverty alleviation. Unfortunately, no convincing explanation is readily available. In view of the trends discussed above, a general tightening of the market for casual labour is unlikely to be the explanation.¹⁵ It is more likely that institutional developments have increased the bargaining power of casual labourers.¹⁶ Such issues, however, cannot be settled without detailed investigations, which cannot be attempted here.

Unemployment and Under-employment

It is often said that, in an economy such as India's, unemployment is a luxury which most people cannot afford. The available statistics on unemployment appear to confirm this view. The rate of unemployment (estimated according to the standard definition) in India fluctuated within a range of 2-5 per cent and showed a feeble tendency to decline over the 16-year period 1977-78 to 1993-94 (Chart 5). Indeed, the

TABLE 4. LABOUR FORCE PARTICIPATION RATE OF POPULATION AGED 15 YEARS OR MORE BY YEARS OF EDUCATION 1993-94

Years of Education	(Per cent)		
	All	Male	Female
0	65.4	91.4	50.3
Up to 5	68.8	90.3	35.1
5 - 8	58.9	78.0	23.3
8 - 10	56.5	74.4	21.2
10 - 12	55.2	69.6	21.8
More than 12	75.2	88.6	38.5

Note: The classificatory categories used by the NSSO are as follows: no schooling, up to primary, middle, secondary, higher secondary, and more than higher secondary. These have been interpreted, in terms of years of education, as 0, up to 5, between 5 and 8, between 8 and 10, between 10 and 12, and more than 12.

CHART 5 RATE OF UNEMPLOYMENT (PER CENT)

Source: Table 12.

CHART 6: UNEMPLOYMENT RATE (PER CENT) BY YEARS OF EDUCATION, 1993-94

Source: Table 12.

absolute number of the unemployed appears to have fluctuated between 9 mn and 12 mn without showing any particular trend.

The most significant feature of unemployment in India, according to these statistics, is a strong positive relation between the level of educational attainment and the rate of unemployment (Chart 6). This fact, together with the fact (noted earlier) that the relation between level of education and labour force participation rate is represented by an elongated U-shaped curve, implies that the level of education of the labour force tends to lag behind that of the population and the level of education of the employed, in turn, tends to lag behind that of the labour force.

Explanations for the observed positive relation between the level of education and the rate of unemployment are likely to be similar to those suggested earlier for the observed relation between the level of education and the participation rate. Young people with some education do not want to engage in low-productivity, low-income work in informal sectors. They tend to seek non-manual work, preferably in the organised sector. They have very good reasons for doing this since, as observed earlier, the service sector actually offers the best quality jobs. The very fact that they have some education also means that their families have some capacity to support them: unemployment is a luxury that at least some of them can afford. Since aspirations, ability to afford unemploy-

ment and the level of education all move together, the outcome is a positive relation between the level of education and the rate of unemployment.

TABLE 5: PERCENTAGE DISTRIBUTION OF POPULATION AGED 15 YEARS OR MORE BY YEARS OF EDUCATION

Years of Education	1983	1987-88	1993-94
All

TABLE 6: EMPLOYMENT GROWTH (PER CENT) AND ELASTICITIES

	1977-78-83	1983-87-88	1987-88-93-94	1977-78-93-94	1983-93-94
All	1.9(0.46)	1.8(0.44)	2.5(0.45)	2.1(0.46)	2.2(0.45)
Agriculture	1.1(0.55)	0.6(0.67)	2.2(0.47)	1.3(0.50)	1.5(0.52)
Industry	3.7(0.70)	4.3(0.77)	2.0(0.36)	3.2(0.59)	3.0(0.54)
Services	3.7(0.68)	4.0(0.68)	3.5(0.55)	3.7(0.63)	3.7(0.60)

Note: Figures in parentheses are employment elasticities

There may be other reasons as well. General education does not equip the educated with particular skills other than perhaps clerical. The educated, therefore, may not necessarily find employment even when the organised sector generates employment at a rapid pace. Moreover, wage differentials corresponding to differentials in the level of education are not really market-determined; excess supply of the educated leads to their unemployment rather than to a narrowing of wage differentials between the educated and the illiterate.

The observed positive relation between the rate of unemployment and the level of educational attainment could, of course, simply be a statistical illusion; it could be that the more educated were just more inclined to report themselves to be seeking or available for work. What seems quite clear, at any rate, is that, in Indian conditions, the rate of unemployment is at best an indicator of labour market mismatches generated by the spread of general education; it says very little about general labour market conditions.

An alternative summary indicator of general labour market conditions, therefore, needs to be defined. The following facts may be usefully considered in this

CHART 7: EFFECTIVE RATE OF UNEMPLOYMENT (PER CENT)

Source: Table 13.

CHART 8: EFFECTIVE RATE OF UNEMPLOYMENT (PER CENT) BY YEARS OF EDUCATION 1993-94

Source: Table 17

context. Each of the existing surveys identified a sizeable number of people as working in a subsidiary capacity, i.e., working for only a small part of the reference period. Some of these people reported themselves to be seeking or available for work for a major part of the reference period and were classified as unemployed. The others, logically, should be classified as being outside the labour force, but researchers in India have rather arbitrarily regarded them as being employed.

It needs to be recognised that, for a variety of reasons, many people, particularly women, are reluctant to admit to seeking paid work when they know such work to be unavailable; but they would in fact be quite willing to accept such work if and when available. For this reason, it is appropriate (though obviously not strictly accurate) to regard subsidiary workers as discouraged workers rather than as non-workers; it is wrong to regard them either as employed or as being outside the labour force.¹⁷ The fact that a very large majority of these subsidiary workers are women (as will be shown below) adds strength to this argument. The evidence also shows that, particularly in the case of women, the rate of unemployment is inversely related to the rate of subsidiary employment, which suggests overlap between those classified as unemployed and those classified as employed in subsidiary capacity.

On the basis of these observations, it can be argued that a good summary indicator of general labour market conditions would

be what might be called the 'effective rate of unemployment'. This can be defined as the ratio of the number either unemployed or in subsidiary employment to the number either employed or unemployed or in subsidiary employment. The estimates show that the effective rate of unemployment has been fairly stable at just over 12 per cent (Chart 7). It had increased, as would be expected, in 1987-88 but fell back to its long term value in the next period.

If the effective rate of unemployment is accepted as a good indicator of general labour market conditions, three major conclusions follow. First, unemployment has been and remains a much more serious problem in India than is usually supposed by researchers and policy-makers. Second, unemployment has not shown any definite trend; this is consistent with the fact that employment growth has kept pace with labour force growth in quantitative terms. Third, the positive relation between the level of unemployment and the level of educational attainment does not seem to be entirely a statistical illusion. The relation survives even when a broad measure of unemployment (i.e., the effective rate of unemployment) is used, though in a weaker form (Chart 8).

One striking fact is that the incidence of poverty is far higher than the rate of unemployment, however measured. According to official estimates, for example, 36 per cent of the population was poor in 1993-94 while the rate of unemployment (according to the standard definition) was

only 2.3 per cent and even the effective rate of unemployment was 12.3 per cent. This large gap between the incidence of poverty and the incidence of unemployment once again emphasizes that many of those counted as employed (even on the stricter definition adopted here) are engaged in very low-productivity and low-income activities.

It also suggests that many of those counted as employed may be seriously underemployed. Underemployment is in fact a characteristic feature of any economy in which self-employment and casual wage-employment predominate. Conceptually, however, underemployment (by time criterion) is difficult to define as it requires defining a norm for full-time employment. If this norm is defined a priori, leisure preferences of workers themselves get ignored and this is hard to justify. On the other hand, there is no easy way of establishing workers' preferences since these are conditioned by the prevailing labour market characteristics. It is most unlikely, for example, that an Indian worker and a Korean worker would have the same notion of full-time employment. Given these difficulties, any measure of underemployment is unavoidably imperfect.

From the available sources, several indicators of underemployment can be constructed. The indicator chosen here relies on information relating to the perception of the employed persons themselves.¹⁸ This type of information is not available from all the existing surveys; time-series analysis cannot, therefore, be attempted. Only the information available

TABLE 7: SECTORAL DISTRIBUTION OF EMPLOYMENT (Per cent)

CHART 9: LABOUR FORCE PARTICIPATION RATE (PER CENT) OF MALES AGED 15 YEARS OR MORE BY YEARS OF EDUCATION 1993-94

Source: Table 4

CHART 10: LABOUR FORCE PARTICIPATION RATE (PER CENT) OF FEMALES AGED 15 YEARS OR MORE BY YEARS OF EDUCATION 1993-94

Source: Table 4.

for 1993-94 is analysed here to get an idea of the broad orders of magnitude.

In 1993-94, 13.5 per cent of the employed persons reported themselves as underemployed (i.e., looking for additional work) and the average underemployed person desired additional employment for three months in the reference year. Assuming that all the employed were available for employment for 12 months in the reference year, the under-employment rate works out to just 3.4 per cent. In other words, just 3.4 per cent of the available labour-time of the employed remained unutilised due to non-availability of jobs. This seems implausibly low.

It is possible, indeed likely, that the employed were not in fact available for work for 12 months in a year. But even if it is assumed (for example) that the employed were available for work only for 10 months in a year, the rate of under-employment still works out to only 4 per cent. Another possibility is that under-employment may have been under-reported. In fact, the recorded data show that people were either seriously under-employed or not underemployed at all. Thus, for example, the average underemployed in all the groups – the self-employed, the regular wage-employees and the casual labourers – was available for additional employment for roughly the same time-period (about three months in the reference year). Very few people in any of the groups, on the other hand, actually reported themselves to be underemployed for short periods. It seems likely that mainly

the severely underemployed perceived or reported themselves to be underemployed at all. Perhaps the right conclusion to draw is that though its overall level for the economy as a whole is not high, under-

employment is a serious problem for a section of the employed labour force.

The most interesting, though not particularly surprising, fact about under-employment is that it affects casual labourers far more than others: 27.4 per cent of the casual labourers reported themselves as underemployed in 1993-94. The corresponding figures were 7.5 per cent for the self-employed and 3.3 per cent for the regular employees. The rate of under-employment (on the assumption that all workers were available for employment for 12 months in the reference year) was 6.9 per cent for the casual labourers, 1.8 per cent for the self-employed and 0.8 per cent for the regular wage employees. These facts show that the overall rate of under-employment in the economy varies directly with the share of casual employment in total employment. As this share has been rising during 1977-78 to 1993-94, it can be plausibly supposed that the overall rate of underemployment has also been rising.¹⁹

VI Gender Inequalities

The dimensions: Females constitute less than one-third of the total labour force in India and their labour force participation

TABLE 9: DISTRIBUTION OF EMPLOYMENT BY STATUS (PER CENT) AND EQI

CHART 11: THE RATIO OF EQI FOR FEMALES TO EQI FOR MALES

Source: Table 15

rate is just about half that of males. To an extent, of course, this inequality reflects the well-known problem of statistical invisibility of women's work.²⁰ There are also factors related to women's reproductive and household responsibilities, as determined by the prevailing socio-cultural context, which constrain their participation in the labour market. But there is also evidence to suggest that discriminatory practices in the labour market may be partly responsible for the low participation rate of women.

One such piece of evidence is that unemployment is a far more serious problem for women than for men. Although the recorded unemployment rate (estimated according to the standard definition) actually tends to be lower for women than for men, this only reveals the inadequacy of the standard measure in the Indian context. For reasons noted earlier, women's unemployment is basically hidden. Most of those classified as subsidiary workers are women (in 1993-94, 87.8 per cent of the subsidiary workers were women) and the effective rate of unemployment for women is six to seven times that for men. Thus, women actually have far fewer employment opportunities than men and this itself is a probable explanation for the lower labour force participation.

The other relevant fact, which suggests the existence of discriminatory practices in the labour market, is that, even among the employed, females fare significantly worse than males. The industrial distribution of female employment is far less favourable than that of male employment; an overwhelmingly large proportion of the employed females, for example, is in agriculture. Compared to the employed males, moreover, a much larger proportion of the employed females is employed as casual labourers. Not surprisingly, underemployment is also higher among employed females than among employed males. In short, the overall quality of female employment is significantly lower than that of male employment. The employed females also earn lower wages than employed males in similar occupations. In

1993-94, for example, the daily wage earned by a female casual labourer in agriculture was 71 per cent of the daily wage earned by her male counterpart.

Some of the inequalities are undoubtedly rooted in the inequality in terms of educational attainment, an inequality that must be attributed to general social biases rather than to discriminatory practices in the labour market. The average number of years of education for the employed

TABLE 10: WAGES AND EARNINGS (MALE, AGE-GROUP 15-59 YEARS)

Note: For estimating real wages and earnings, the consumer price index for agricultural labourers has been used for rural areas and the consumer price index for industrial workers has been used for urban areas. Real wages and earnings are estimated in 1977-78 prices.

CHART 12: AVERAGE YEARS OF EDUCATION, RATIO OF THE VALUE FOR FEMALES TO THAT FOR MALES

Source: Tables 5 and 18

females, for example, is much lower than that for the employed males and this basically is a reflection of the fact that the average number of years of education for the female population is much lower than that for the male population. This inequality, to be sure, partly explains the lower quality of female employment as also the lower average earnings of the employed females. But discrimination in the labour market itself provides a part of the explanation as well, particularly in the case of wage inequality.

The trends: During 1977-78 to 1993-94, the labour force participation rate of females declined while that of males remained stable. As a consequence, female labour force grew at a slower rate (1.8 per cent per annum) than male labour force (2.2 per cent per annum) and the share of females in total labour force fell from 33.9 per cent in 1977-78 to 32.4 per cent in 1993-94. Thus there was a noticeable trend towards 'masculinisation' of the labour force in India.²¹

Yet the underlying factors responsible for the changes in the participation rates were quite similar for the two groups. For both groups, the share of working-age population in total population increased while the participation rate of this age-group declined and the share of non-working-age labour force in total labour force also declined. The explanations for these trends were also the same. The relationship between the participation rate of the working-age population and the level of educational attainment is represented by an elongated U-shaped curve for both males and females (Charts 9 and 10) and the decline in the participation rate resulted, in both cases, from the expansion of general education. The participation rates of both male and female children declined and the participation rates for older population – both male and female – increased.

The differences lay in the relative rates of change. The 'unfavourable' effect of education on the participation rate of working-age females was sharper than that in the case of working-age males. The effect of the decline in the incidence of child

labour was also sharper in the case of females as the share of child labour in female non-working-age labour force was higher.

Effective rate of unemployment (per cent)	27.4	26.8	28.5	28.9

Note: The hidden rate of unemployment is defined as: (number unemployed + number in subsidiary employment)/(the number + number employed).

CHART 13: THE RATE OF MALE UNEMPLOYMENT (PER CENT) BY YEARS OF EDUCATION 1993-94

Source: Table 17.

CHART 14: THE EFFECTIVE RATE OF MALE UNEMPLOYMENT (PER CENT) BY YEARS OF EDUCATION 1993-94

Source: Table 17.

Another discernible negative trend is that though the sectoral distribution of employment for both males and females changed in the same direction, the change was much slower in the case of female employment. Between 1977-78 and 1993-94, for example, the share of agriculture in male employment declined by more than 8 percentage points (from 65.1 per cent in 1977-78 to 56.9 per cent in 1993-94) while that in female employment declined by less than 5 percentage points (from 79.4 per cent in 1977-78 to 74.5 per cent in 1993-94).

The quality of employment (as indicated by EQI) declined for both males and females but the decline was sharper and more consistent for males; the result was a decline in male-female differential in terms of quality of employment (Chart 11). The underlying reasons were as follows. The share of casual wage-employment in total employment increased at a faster pace for males than for females. Correspondingly, the share of regular wage-employment (particularly in the organised segment) in total employment declined for males but increased for females.

Obviously, the declining trend in male-female differential in terms of quality of employment cannot be regarded as unambiguously positive since the context was one of declining quality of employment for both males and females. Nevertheless, it may be indicative of a declining trend in gender-based discrimination. Such a view receives support from the evidence on developments in the area of education (Chart 12) and wages. The average num-

ber of years of education for the female population increased at a faster rate than that for the male population. Correspondingly, the average number of years of education for the employed females also

increased faster than that for the employed males. Male-female wage differentials too showed a feeble tendency to decline.²²

One difference between males and females in terms of the nature of involvement in the labour market is worth noting. As already stated, most of the subsidiary workers are women. As such, the difference between the standard rate of unemployment and the effective rate of unemployment is quite small in the case of males but large in the case of females. Unsurprisingly, in the case of males, the relation between the effective rate of unemployment and the level of educational attainment is very similar to that between the standard rate of unemployment and the level of educational attainment; both rates of unemployment rise more or less steadily as the level of educational attainment rises (Charts 13 and 14). In the case of females, however, the two relationships are quite different. The standard rate of unemployment rises steadily as the level of educational attainment rises (just as in the case of males), but the relation between the effective rate of unemployment and the level of educational attainment is represented by an inverted U-shaped curve (Charts 15 and 16). This difference between

TABLE 14. INVOLUNTARY UNDEREMPLOYMENT OF PRINCIPAL STATUS WORKERS 1993-94

Total number (millions)	43.5	7.4	37.8	88.7
Of which (percentages):				
Neither seeking nor available for additional work	92.2	95.9	70.1	83.1
Seeking or available for additional work	7.8	4.1	29.9	16.9
For less than 1 month	0.2	0.0	1.3	0.7
For 1-3 months	4.1	2.7	13.2	7.9
For 3-6 months	3.5	1.4	15.4	8.3
Average (months)	3.1	2.8	3.2	3.2
Rate of underemployment (per cent)	2.0	0.5	8.0	4.5

Note: In estimating the average number of months for which the underemployed were seeking additional work, 'less than 1 month' is interpreted as 0.5 months, '1-3 months' is interpreted as two months and '3-6 months' is interpreted as 4.5 months. The rate of under-employment is estimated on the assumption that all workers were available for work for 12 months.

CHART 15: THE RATE OF FEMALE UNEMPLOYMENT (PER CENT) BY YEARS OF EDUCATION, 1993-94

Source: Table 17

CHART 16: THE EFFECTIVE RATE OF FEMALE UNEMPLOYMENT (PER CENT) BY YEARS OF EDUCATION, 1993-94

Source: Table 17

males and females has an important implication: the level of unemployment (broadly interpreted) has a stronger influence on labour force participation of females than on that of males. While the participation rate varies inversely with the level of effective unemployment for both males and females, the inverse relation is significantly stronger in the case of females (compare Chart 14 with Chart 9 and Chart 16 with Chart 10).

VII Child Labour

Some basic facts: In 1993-94, population belonging to the age-group 5-14 years numbered 215.2 million of which 13.3 million (6.2 per cent) were in the labour force and 10.1 million (4.7 per cent) were in employment.²³ Child workers constituted 3.4 per cent of the total labour force and employed child workers constituted 3 per cent of all employed workers. Female children accounted for 45.1 per cent of the child labour force and 42.6 per cent of the employed child workers. Unemployment according to standard definition was insignificant among child workers (0.7 per cent for all child workers, 1.4 per cent for males and 0 per cent for females), but effective unemployment was high (24.1 per cent for all child workers, 20.5 per cent for males and 28.3 per cent for females).

As regards distribution by type of employment, 58.4 per cent of all employed child workers were self-employed, 33.7 per cent worked as casual labourers and the remaining 7.9 per cent were regular wage-employees in unorganised activities.²⁴

Agriculture accounted for more than 75 per cent of total employment of child workers, more than 81 per cent of self-employment, more than 71 per cent of casual employment and around 41 per cent of regular wage-employment. The service sector employed around 45 per cent of all regular wage-employees among child workers.

Several conclusions emerge from these basic facts. First, the overall incidence of child labour cannot be said to be high.²⁵ Second, agriculture is by far the dominant employer of child workers. Third, most of the child workers work either as self-employed or as casual wage-labourers. Fourth, effective unemployment among child workers is high. This suggests that the main explanation for the existence of child labour is to be found on the supply side rather than on the demand side of the labour market. It is not that the economy cannot do without child labour; it is rather that many children cannot do without employment.

The trends: The labour force participation rate of children declined from 11 per cent in 1977-78 to 6.2 per cent in 1993-94. As a result, the share of child labour force in total labour force also declined from 7 per cent to 3.4 per cent during the same period. In fact, even the absolute size of the child labour force declined from 20.6 million in 1983 to 13.3 million in 1993-94. Actual employment of children showed very similar trends. The share of child employment in total employment declined from 6.9 per cent in 1977-78 to 3 per cent in 1993-94. During the same period, the absolute number of children in employment declined from 16.8 million to 10.1 million. The trends were similar for both

TABLE 15: PERCENTAGE DISTRIBUTION OF EMPLOYMENT BY STATUS: MALE AND FEMALE WORKERS

male and female children. However, the participation rates as well as the absolute size of the child labour force declined at a slower rate for females than for males. Employment of female children also declined at a much slower rate than that of male children. The share of females in child labour force as also in child employment increased as a result.

Two conclusions are already suggested by these facts. First, there has been a long-term tendency for the incidence of child labour to decline though the widespread concern with child labour is only of recent origin. This suggests that economic development reduces the incidence of child labour even in the absence of social movements or targeted policies and programmes. This, of course, is consistent with the earlier observation that child labour is primarily a supply-side phenomenon. As widely believed, it is poverty, which basically explains the existence of child labour; the declining incidence of child labour is largely attributable to the declining incidence of poverty. Second, general social biases have their manifestations in the world of child labour as well; the existence of gender-based discrimination in society seems to be the most plausible explanation for the slower rate of decline in the employment of female children.

The direction of change in the sectoral distribution of employment of child labour was the same as that in the case of all workers, though the pace of change was somewhat slower. The distribution of employment by type (or employment status) also changed in the same direction for child workers as for all workers, but the pace of change for child workers was again slower. Remarkably, however, the pace of casualisation of wage-employment was faster for child workers than for all workers. Correspondingly, the share of regular wage-employment in total employment declined fairly sharply for child workers while this in fact showed a tendency to rise for all workers.

It is important to remember that all these changes in the structure of employment of child workers occurred in a context where the absolute number of employed child workers was declining (the context was entirely different in the case of all workers). Child employment in absolute terms was declining in all sectors as well as in all types of employment. The changes in employment structure resulted from differential rates of decline in different sectors and in different types of employment. The sharpest decline occurred in regular wage employment and the slowest decline occurred in casual wage employment.

It is arguable that while all forms of employment of children must be judged as undesirable, some forms are more undesirable than others. Regular wage employment of children, which is mostly in non-agriculture, is usually exploitative in character. Self-employment, which is mostly in agriculture, is far less exploitative and has one positive aspect; traditionally, it has been a form of apprenticeship through which the younger generation acquires skills from the older generation. Casual wage-employment, which again is mostly in agriculture, also has an apprenticeship dimension. In the light of these observations, it can be said that the overall trends in the area of child labour have been positive not only because the overall incidence of child labour has been declining but also because the worst form of child employment (i.e. regular wage employment) showed the fastest decline.

VIII Concluding Observations

Between 1977-78 and 1993-94, the Indian economy recorded a growth rate of nearly 5 per cent per annum. Though not spectacular, this performance is nevertheless decent by the standards of developing countries. The impact of this growth on employment, however, has been much weaker than expected. Since the labour force actually grew at a relatively low rate during the period, it seems clear that growth has not been employment-friendly.

It is difficult to state unambiguously if overall employment conditions improved or deteriorated during the period. The level of unemployment remained fairly stable and there were positive trends in some areas. The incidence of child labour declined quite significantly. The growth in real wages of casual labour and the decline in the gap between the incidence of poverty and the effective rate of unemployment indicate that the quality of jobs at the lowest level improved somewhat. Alongside these positive trends, however, certain negative trends are also observed. At the aggregate level, the quality of employment deteriorated in the sense that the share of low-quality employment in total employment increased. The growing casualisation of employment implies that the level of underemployment has also been increasing. The changes in gender inequalities were ambiguous. While male-female differentials in education and in earnings narrowed somewhat, the gap in terms of unemployment level tended to widen. The decline in the labour force

participation rate of females must also be regarded as a negative trend.

Perhaps the only conclusion that can be drawn is that overall employment conditions neither improved nor deteriorated.

TABLE 17. UNEMPLOYMENT OF PERSONS AGED 15 OR MORE YEARS BY YEARS OF EDUCATION, 1993-94

Years of Education	Rate of Unemployment (Per Cent) (Standard Definition)	Effective Rate of Unemployment (Per Cent)
All		
0	0.2	13.3
Up to 5	1.1	7.5

More than 12	0.8	1.9	2.4
Average years of education	0.8	1.0	1.4
Average years of education, Female-male ratio	0.27	0.31	0.37

Note: See note to Table 4.

The fact that a rate of economic growth of nearly 5 per cent failed to make much of an impact on overall employment conditions even though the rate of growth of labour force was relatively low cannot but be viewed as a matter of concern. The crux of the problem appears to have been the slow growth of organised sector employment. During the 16-year period, organised sector employment grew only at a rate of 1.6 per cent per annum (while total employment grew at a rate of 2.1 per cent per annum). Even this slow growth was to an extent artificially sustained. For, the organised sector was actually accumulating 'surplus labour'; crude estimates for 1990-91 show that around 16.5 per cent of the workforce employed in the sector were effectively redundant.²⁶

The deterioration in the quality of employment at the aggregate level was a direct consequence of the slow growth of organised sector employment. Inter-sectoral labour transfers occurred at a very slow pace and contributed little to productivity growth in the economy. Indeed, such labour transfers merely served as a mechanism for transferring surplus labour from agriculture to non-agriculture. Even such transfers have been small so that agriculture has remained the principal reservoir of surplus labour. On the whole, India's experience suggests that employment conditions are hard to improve if the Lewisian modern sector fails to generate jobs at a rate higher than the rate of labour force growth. Special schemes for employment generation cannot make up for this failure.

One acknowledged reason for the slow growth of organised sector employment was the emphasis on heavy industries in India's industrialisation strategy.²⁷ Another reason lay in the 'rigidities' which emerged in the organised labour market as a result of the 'wellarist' labour policy pursued in the country. Recent studies suggest that the job security regulations and the wage system were the major sources of these 'rigidities'.²⁸ The job security regulations, by making labour adjustments difficult and expensive, on the one hand led to labour hoarding in inefficient enterprises and on the other hand effectively pushed the cost of fresh hiring far above actual wage costs. The wage system ruled out possibilities of wage adjustments in response to changes in productivity or profitability. These problems remained hidden in the quasi-closed economy which had evolved because costs could always be passed onto prices. Though this could conceivably have restrained the pace of growth itself (by restraining the growth of

demand), this effect remained invisible. The 'rigidities' also generated strong incentives for adoption of capital intensive technologies at the margin in the organised sector. The high real cost of labour discouraged labour hiring at the margin. The insensitivity of wages to productivity changes meant that it was always possible to increase profit margins by increasing labour productivity through increases in capital per worker.

In the post-1991 period, there has been much talk in policy circles about increasing the rate of economic growth through adoption of outward-oriented policies. The relevance of this in the context of an employment strategy cannot be seriously questioned. Higher growth and less emphasis on heavy industries should have the

effect of stimulating employment growth in the organised sector. But this is unlikely to be enough. Labour force growth will be higher in the future than it had been in the past. The competitive pressures engendered by trade liberalisation are also likely to encourage adoption of improved technologies even in relatively labour-intensive industries.

In these circumstances, all existing incentives for adoption of capital intensive technologies will need to be removed. Policy-makers, therefore, will need to worry about labour policy reform needed to increase flexibility in the organised labour market.²⁹ Concern for job security for a few would have to be replaced by concern for income security (and, relatedly, employment security) for all and the wage

TABLE 19. CHILD LABOUR

	1977-78	1983	1987-88	1993-94
Employment (millions)	16.8	16.6	11.8	10.1

Effective rate of unemployment (per cent)	13.4	19.4	33.3	24

system would have to be re-designed so as to make wages responsive to changes in productivity and profitability.³⁰

There is another major problem that policy-makers need to worry about. The average level of education of the population, of course, is extremely low; in 1993-94, an Indian aged 15 or more years had, on average, only 3.3 years of education. But, more disturbingly, it appears that the Indian economy does not get the full benefit of even this low level of education; the labour force has lower average level of education than the population and the employed have lower level of education than the labour force. There seem to be two main reasons for this state of affairs. First, education, though provided largely by the state, has remained a luxury good so that many of those who can afford to get education can also afford to be idle. Second, aspirations of the educated tend to be inconsistent with their skill profiles as well as with the requirements of the economy. These features need to be radically altered and this will require serious reform of the education system; a mere expansion of education will only increase open unemployment. Education policy has to be viewed as part of employment policy.

Policies must also address another general problem indicated by the large gap between the incidence of poverty and that of unemployment. Many of those counted as employed actually earn incomes which are below the official poverty line. Underemployment provides only a small part of the explanation for this. A more important explanation is to be found in the extremely low wages for casual labour. There is evidence to suggest that even if the casual labourers had full-time employment at the prevailing wage rates, they would still be poor. In these circumstances, the special employment schemes cannot achieve much. For they are generally designed on the basis of two rather inappropriate assumptions: that underemployment is the main problem facing the poor and that wages paid for work under the schemes have to be lower than the prevailing market wages if leakage of benefits to the non-poor is to be minimised. In reality, what is needed is not so much additional days of employment as a higher level of wage per day of work. The policy that deserves serious consideration in this context is one of enforcement of a national minimum wage, equal to what has been termed poverty-line wage in this paper, for unskilled labour.³¹

The problems of gender inequalities and child labour also need to be urgently

addressed. Reforms of growth strategy, labour policy and education system are of obvious relevance in this context insofar as these help in stimulating demand for labour in general. It would be useful, moreover, to strengthen the special programmes, which already exist. But wider issues of social policy are also involved. Elimination of gender inequalities requires not only elimination of discriminatory practices in the labour market but also major changes in the socio-cultural context. Elimination of child labour requires elimination of poverty.

Notes

[The views expressed in the paper are the author's and should not be automatically attributed to the ILO, South Asia Multidisciplinary Advisory Team in New Delhi.]

- 1 See Chakravarty 1987 for a detailed discussion
- 2 See Mahalanobis 1985.
- 3 See Lewis 1954
- 4 Regular wage employees are those who are paid wages on a weekly or monthly basis while casual labourers are those who are paid daily wages
- 5 Cf Visaria and Minhas 1991 and Sen 1998
- 6 This can be contrasted with the pattern observed in OECD countries where labour force participation rate rises steadily with the level of educational attainment. See, for example, OECD 1995.
- 7 Rather puzzlingly, daily status employment in agriculture showed significantly faster growth during 1983-88 than during 1977-88. See Sen 1998
- 8 Lewis 1954.
- 9 These results cannot be said to be wholly unanticipated in view of the fact that India's model of planned development had in effect ruled out what has been referred to as the Lewis process
- 10 Finer classification of jobs according to quality is obviously possible. Regular wage-employment in formal agriculture, for example, is not exactly equivalent to regular wage-employment in modern industry or services. The classification outlined above, however, is considered adequate for purposes of analysis in this paper.
- 11 There are two types of regular wage-employees in agriculture: traditional attached labourers engaged by landowning households and plantation workers. The system of attached labour was really a feudal institution, which has been dying a natural death. The number of attached labourers has been dwindling over time and this is the underlying reason for the observed decline in regular wage employment in agriculture.
- 12 The finding that quality of employment has been and remains the highest in 'services' may appear somewhat surprising. But it merely reflects the fact that much of the employment in services is in the public sector. It also underlines a problem area in India's labour policy: the existing labour protection system basically benefits service sector employees.
- 13 Cf Sen 1996; Tendulkar, Sundaram and Jain 1996; and Duhey and Gangopadhyay 1998.
- 14 The official poverty-line expenditure levels are Rs 49.09 per capita per month for rural areas and Rs 56.64 per capita per month for urban areas, both reckoned in 1973-74 prices
- 15 Some economists have argued that there indeed was a tightening of rural labour markets as a result of substantial increases in public expenditure, which led to a rapid growth of non-agricultural employment. See Sen 1998. The evidence presented by him certainly supports his argument. But there is something odd about the evidence presented. As already noted, it is difficult to understand why daily status employment in agriculture increased faster during 1983-88 than during 1977-83
- 16 The developments could include growth of awareness and organisational strength of rural workers, increased effectiveness of government interventions, etc
- 17 Obviously, not all subsidiary employment need be involuntary. Housewives and students, for example, may occasionally work to help their families tide over temporary difficulties. In the judgment of this author, however, only a fraction of the reported subsidiary employment is of this type
- 18 The usual indicator used by Indian researchers is based on a comparison of the weekly status unemployment rate with the daily status unemployment rate, the gap between the two being interpreted as underemployment. As already noted, however, the conventional method of estimating unemployment rate – weekly status or daily status – is of very limited relevance in the Indian context
- 19 This conclusion contradicts the conclusion usually drawn by the Indian researchers according to which the rate of underemployment in the Indian economy has been declining. See, for example, Papola 1993, Visaria and Minhas 1991, and Sen 1998
- 20 Many of women's activities (related to house-keeping), though vitally important for material well-being of the population (particularly so in a developing country context), are not counted as economically gainful activities in censuses and surveys. Even activities such as tending cattle or growing vegetables tend to go unrecorded as gainful activities
- 21 This stands in contrast with the trend towards 'feminisation' observed in most countries of the world
- 22 Given the widening gap in effective unemployment rates between males and females, this narrowing of the wage-differentials is likely to be attributable to non market factors.
- 23 It is worth pointing out that though child workers are being defined as those belonging to the age-group 5-14 years for the sake of completeness of the picture, very few of the child workers in India actually belong to the age-group 5-9, a typical child worker belongs to the age-group 10-14
- 24 It would not be incorrect to assume that the organised sector does not employ child workers although no direct evidence is available.
- 25 This does not mean that the problem should not be treated as serious. For, ideally, the incidence should be zero.
- 26 Cf ILO 1996. It is of some interest to note here that the emerging problem of surplus

labour in organised industries was diagnosed by Mahalanobis as early as 1960. See Mahalanobis 1960

27 As already mentioned, slow growth of organised sector employment was in fact anticipated by the architects of India's development strategy

28 See, for example, ILO 1996.

29 It has been argued, correctly, that flexibilisation of the organised labour market will achieve very little if the aggregate demand in the economy fails to grow. See Bhaduri 1997. It should be pointed out, however, that growth of aggregate demand is the principal determinant of growth of output while the degree of flexibility in the organised labour market can be viewed as the principal determinant of employment elasticity of output. Efficient management of aggregate demand, therefore, does not eliminate the need to increase labour market flexibility. The question that must be asked is: would efforts to increase flexibility of the organised labour market reduce the aggregate demand? There can only be an empirical answer to this question. In so far as such efforts might lead to a reduction of organised sector employment in the short run, the possibility of a decline in aggregate consumption expenditure cannot obviously be ruled out. But the seriousness of this cannot be predicted a priori. Compensation payments to retrenched workers may

prevent a decline in their consumption expenditure in the short run. The decline in the effective cost of fresh hiring may also stimulate investment in labour-intensive activities.

30 If flexibilisation of labour market is not to imply insecurity of incomes and employment for workers, appropriate labour market institutions and safety net mechanisms have to be put in place. For a brief discussion, see Ghose 1996.

31 The case for a national minimum wage for unskilled labour has been discussed in some detail in Ghose 1997.

INSTITUTE OF ECONOMIC GROWTH

UNIVERSITY ENCLAVE

DELHI - 110 007

IEG plans to appoint (a) one Professor in the RBI Endowment Unit, and (b) one Reader and (c) one Research Associate (in the Lecturer's grade) in the Development Planning Centre; all with revised UGS scales and allowances.

Qualifications:

For post (a): An outstanding scholar with a Ph. D. in economics, at least 10 years of research experience in applied econometrics and specialization in Money or Trade or Income and Employment.

For post (b): Good academic record with at least a high Second Class M.A. Degree and Ph.D. in Economics, with at least five years of experience in quantitative analysis and knowledge of econometrics and macro-economic forecasting.

For post (c): Good academic record with at least a high Second Class M.A. Degree in Economics/Econometrics and M. Phil/Ph.D. or equivalent published empirical research work on development issues.

The Institute reserves the right to consider candidates who have not applied and also not to fill the posts.

The interested persons may send their bio-data with names of three referees and copies of three best publications to the Director of the Institute within three weeks of publication of this announcement.

Director

Dalit Assertion through Electoral Politics

Pushpendra

The post-independence period has seen democratic institutions gaining greater legitimacy among the scheduled castes, who having grown conscious of their numerical strength in electoral arena, are exercising their voting right more forthrightly. This has liberated them from the role of passive voter-supporter in the overall environment of subjugation and subordination, to actively shifting their traditional party loyalties in favour of new parties espousing their interests. If the SCs in varying degrees have deserted the Congress, in various states, the growing class differentiation amongst them has resulted in the lower class dalits opting for exclusively SC-based parties like the BSP, the Left Front or the left-of-the centre regional parties. Yet, as the CSDS survey shows, though political institutions of Indian democracy have gained support of the SCs, there has been a erosion of their confidence in the political parties. This alarmingly signals that the support extended by the dalits to the parliamentary system should not be taken for granted.

WITH the 1996 elections to the 11th Lok Sabha, Indian polity seems to have embarked upon a phase of fierce competitive politics. The era of one-party dominance has made way for coalition politics. The gradual decline of the Congress, leaving behind its murky shadow; the growing strength of the BJP edging past the Congress in terms of seats in the parliament and its expansion all over the country; the emergence of regional parties as important political players in a number of states; the strengthening of smaller parties (such as the Samajwadi Party, Samata Party, Janata Dal, Rashtriya Janata Dal, Bahujan Samaj Party, etc) with their specific group followings and limited areas of influence, etc, mark the changes that are taking place in Indian party politics. These changes in party politics in themselves are expressions of larger changes that are enveloping the Indian society today. Different sections of the society are desperately trying to assert themselves in politics. The social composition of the parties and articulations of group interests by them have undergone major changes. Their failure to get accommodated in established national political parties has given rise to the number of smaller parties. The upper castes, particularly in northern India, have by and large deserted the Congress and instead chosen to rally behind the BJP. The ongoing processes of the political rise of the backward castes, despite their inter- and intra-caste divisions and conflicts, have found strong political representation in the form of parties like the Rashtriya Janata Dal, Janata Dal, Samajwadi Party, Samata Party, the regional parties and the left. Muslims have also deserted the Congress and appear to have allied with other parties in order to ensure the defeat of the Congress and the BJP.

In this context, understanding the electoral behaviour of the scheduled castes (SCs) has become very important. The

general elections of 1996 and 1998 saw a powerful assertion of dalit politics. What we observe in these two elections is to our surprise, a different SC voter who is no longer a 'captive' follower of the Congress. These elections highlight a new phase in their political consciousness, mobilisation and organisation in the country. One witnesses a concerted effort by the SCs to create a new political identity for themselves by using the levers of competitive politics. Increased voting by the SCs, shifts in their party preference and a complex pattern of their voting, their general support for the left or left-to-the-centre parties, rise of the BSP, effort to emerge as a political bloc despite internal class differentiation, and increase in the level of legitimacy given to the democratic institutions are some of the important expressions of their political assertion.

This paper attempts to examine the data on voting behaviour of the SCs. I have traced the changes in party preference of the SCs. In order to explain why this assertion took place through elections I have analysed the opinion of the SCs about the legitimacy of the political system. A further attempt is made to find internal differentiation among SCs regarding their voting behaviour. I have also tried to explain the phenomenon of the rise of the BSP. The concluding part reflects upon the implications of SCs' assertion through electoral politics.

This study is based on the post-poll survey data of the 1996 and 1998 Lok Sabha elections, collected by Centre for the Study of Developing Societies (CSDS), Delhi. During the 1996 post-poll survey, the total number of respondents was 9,614 out of which 1,791 belonged to the SCs and 3,357 belonged to the upper castes. The respective figures for the 1998 elections were 8,133, 1,312 and 2,039. This caste division applies to all religious groups. Interestingly, out of the total

respondents during 1998 post-poll survey, 5,138 respondents were those who were interviewed in 1996. This, of course, provides an opportunity to look at the swing in terms of party preference by the same voter. But this has not been attempted in this paper. The paper is confined to analysing the aggregate samples of the two election surveys.

An important feature of the 1996 election survey data was the collection of detailed information on personal backgrounds of the respondents, such as age, education, occupation, housing, landholding, asset holding, self-assessment of required income to meet household expenses, etc. This helped in determining the class position of the respondents and enabled to undertake a class-in-caste analysis. Unfortunately, during the 1998 post-poll survey, background information required to determine class of the respondent was restricted to only three variables – landholding, occupation and type of house. Further, landholding data was completely unusable. Occupation details were classified at the time of data entry in a way that greatly undermined its sensitivity as an indicator. Using the background information of the 5,138 (panel) respondents could have been one option. But it has its own problems as we cannot rule out the possibility of at least some households having been undergone changes in class status between two elections. I have therefore used the class analysis based on 1996 background details as a proxy for 1998 elections too.

The figures reveal the presence of a sizeable section of middle class and even a small elite class among the SCs. Since the sample size of the upper class, in case of the SCs, is very small and in a number of instances, though important, statistically not valid for offering any analysis, for the sake of convenience I have merged both the upper and the middle class

categories. Moreover, a careful look at the financial/occupational background of the respondents suggests that the upper class, as categorised here, for all practical purposes resembles the upper middle class.

The samples of the two post-poll surveys were drawn at the national level. Naturally, while taking up the analysis to the state level, certain differences/gaps can be observed from the figures of the Election Commission (EC) with respect to the voting percentage and party preference by the voters. In the case of states like MP, Karnataka and Assam, the gap is really significant. The sample size was relatively small for taking up any rigorous interpretation at the state level, which led to under-representation of regional variations within the states. One way could be to adjust the variation for the actual figures released by the EC. I have preferred the post-poll figures because most of the analysis in the paper is done at the all-India level for which the authenticity of data cannot be doubted. Adjusting the variation in case of certain states may result in some other distortions particularly with regard to issues like the perception of the legitimacy of the system, influence of age, sex, locality, education, occupation and caste on party preference, etc. Moreover the EC data do not contain these information to make adjustments in disaggregated data. Also, there is no solid reason to believe that the difference between the two data set in terms of percentage of vote secured by political parties can be evenly attributed to all the variables.

It is also necessary to point out some of the other limitations of the data base with respect to the present study. The election surveys of 1996 and 1998 (NES 1996) conducted by the CSDS were not primarily focused on studying the specific features of the SC voting behaviour. For this, a different type of sampling procedure is required keeping in mind the variation in SC population in different states, and within the states, sufficient sample size, nature of political parties, nature and extent of political participation of the SCs in different states, etc. In fact, indicators also need to be sharply focused to study various dimensions of the dalit politics. However, this does not undermine the importance of the available data that I have culled out according to the needs of the study wherever sample size permitted me.

CONTEXTUALISING SC VOTING

Any change in the voting behaviour of the SCs acquires great significance in view

of the fact that the SCs find themselves in a web of socio-economic deprivation. The political system, at least theoretically, grants political equality to all, irrespective of caste, wealth, privileges, etc., to be exercised through participation in voting, contesting elections and other forms of participation. Political equality, as opposed to social and economic ones, opens up, in principle, opportunities to utilise political democracy for sharing power and material benefits accruing of it. However, the social and economic inequality practically acts as a limiting factor to take advantage of equal political opportunities. Hence, a brief account of the socio-economic deprivations of the SCs is in order.

According to the 1991 Census, the literacy rate of the SCs is 37.41 per cent as compared to 52.21 per cent as a whole. A smaller proportion of the SCs reside in urban areas as compared to the upper castes – 18.7 per cent of SCs to 29.2 per cent of the total population reside in urban areas. Of the total population of the SCs, 45.4 per cent are agricultural labourers and only 23.6 per cent are cultivators out of the total main workers. The reverse is true for the general category for whom the respective figures are 20.1 per cent and 40.5 per cent.

According to the Agricultural Census, 1991, the average size of landholding is one acre in case of SCs, and 1.61 acres for the general category. The ratio of share in land to share in population stands 0.48 for the SCs, and 1.07 for the general. The size-wise distribution of operational holdings for the SCs and the general category suggests that there is acute inequality in land distribution. Among the SCs, 71.8 per cent of their holdings are less than one acre, covering only 25.7 per cent of the cultivated area. In the case of the general category, there is better distribution of landholdings in different size groups, with the highest concentration in the size class of 4 to 10 acres. In the general category, 58.6 per cent of holdings are less than one acre and the area covered by them is 14.5 per cent. This inequality in landholding is illustrative of the structural barriers in the way of economic development of the SCs.

The political deprivation of the SCs is no less important. Political participation of dalits is largely confined to casting of their vote. Whatever be their level of participation, its effectiveness can always be doubted. Their overwhelming support to the Congress offered little and failed to reduce their political deprivation. One expression of their frustration and anger

at their deprived conditions has been their organised protest movements in states like Bihar, Andhra Pradesh, and parts of Madhya Pradesh, Maharashtra, Orissa, etc.

However, there have been slow and steady changes in the socio-economic and political status of the SCs. Because of a host of processes of upward mobility like sanskritisation, diversification of occupations, migration, urbanisation, and so on, and also due to decline in the upper castes' dominance, the SCs have been able to make some advancements towards minimising their various deprivations, particularly the political ones. Besides their educational level improving gradually, the policy of protective discrimination has contributed in creation of a small elite and middle class, mostly in service sector, thus, resulting in internal differentiation on class lines. Getting organised under mass organisations, trade unions, political parties and various protest movements, have increased their level of participation. Such organisations and movements are more politicised, different from the Congress variant of welfare-oriented politics, militant and uncompromising in outlook, and are keen to assert a distinct dalit identity. All these have boosted the confidence and aspirations of the SCs and encouraged them to overcome their socio-economic and political deprivations.

Normally, political deprivation is considered relatively less difficult to fight against. This assumption is validated by the ascendance to power of the OBCs. Yet, political mobilisation need not take the route of organising communities on traditional identities only. It can base itself on class lines cutting across the traditional structures of caste, tribe, religion, etc. However, in both cases, the underlying logic is that it is the collective strength of sheer numbers that will compensate for other disabilities, and further lead to the complex strategic issues of political formation, coalition, and so on. This is the art of real politicking. Collective internalisation of this art by a community and the maturity of its political leadership in mastering this art, plays a key role in political rise of that community.

TABLE 1: CASTE-CLASS DIVISION OF RESPONDENTS, 1996

Class Division	SC	Upper Castes
Upper class	32 (1.8)	408 (12.2)
Middle class	412 (23.0)	1559 (46.4)
Lower class	1341 (74.9)	1380 (41.1)
Class couldn't be ascertained	6 (0.3)	10 (0.3)

Note: Figures in the parentheses denote percentage.

Conditions have begun to change now. The voting percentage of the SCs has steadily gone up. In the 1996 general

One plausible explanation for the steady rise in the SC voter turnout may be that

The high SC voter turnout gains significance in the light of the various restrictions the EC has imposed on poll campaigns. Firstly, the duration of the poll campaign has been reduced by one week. Secondly, there is a ban on posterage on private walls, and the number of vehicles to be used for campaign has been restricted. There has been also a ban on playing of loudspeakers at public places, because of which candidates have to rely mostly on door-to-door campaigning. As a result the political parties complained of difficulties in reaching to the people. There was a general apprehension that the weaker sections like the scheduled castes, who did not have much access to modern means of communication like TV and radio, may

(Per cent)

9 The vote percentage of the JD includes that of the JD-Samajwadi Party alliance.

find it difficult to get information about local candidates and the programmes and promises of the parties/candidates, and this may affect their turnout on the voting day. But the fact that the SCs have surpassed the upper castes in terms of voter turnout testifies their increased political awareness and their desire to assert.

CONGRESS NO LONGER THE OVERWHELMING CHOICE

The most important feature of the recent upsurge in the dalit politics has been the change in their party preference. Since independence, the SCs were considered a 'committed' vote bank of the Congress. The Congress, in the pre-independence period, did provide political space for the SCs to participate in the freedom struggle. This is not to deny the role of power, hegemony, and dominance exercised by the upper castes, who dominated the upper layers of the Congress leadership. At times we find that the SCs waged anti-feudal struggles against the local landlords. At many places, it were the communists who attracted them. Ambedkar too had a following among them. Nonetheless, it was the Congress that made the dalits believe that the political system in independent

India would offer a bright future for them. The Republican Party of India (RPI) did try to challenge this dominance in the most part of the 1960s, but its influence was restricted only to Maharashtra and UP, that too only in a few districts of these states. By the end of the 1960s, even the RPI lost its sheen. The SC voters remained loyal to the Congress even in the troubled times of 1967 and 1977 (the percentage of SC votes polled by the Congress was 45.2 in 1967, 47.8 in 1971, 52.8 in 1980). Only in 1977, the Congress could barely manage 35.7 per cent of the SC votes [Singh 1992:247]. Some fluctuations notwithstanding, never in the past the Congress faced any serious threat to this 'captive' vote bank except in a few states under the Left rule. However, signs of decline in its SC vote share became the order during the elections held in the late 1980s and the early 1990s. The 1996 Lok Sabha elections finally presented a changed electoral landscape, wherein the SCs had deserted the Congress in many states, particularly in important north Indian states like UP and Bihar. This is also one of the reasons why for the first time the Congress failed to become the single largest party in the Lok Sabha. The 1998 elections

closely followed the SC voting pattern of the 1996 elections. Except for few states, the Congress no longer remains the choice of the majority of the SCs.

The overall emerging pattern is that wherever the SCs could find a viable alternative, they have preferred it to the Congress. The BSP has become their first choice; in its absence, the Left Front and the regional parties are preferred in states where they have dominance. However, on account of its all India presence, the Congress still polls the largest share of the SC votes – 31.4 per cent in 1996 and 29.9 per cent in 1998. In contrast, the percentage of the SC votes in the total votes polled by the Congress was 21.6 and 22.8 per cent in 1996 and 1998 elections respectively. Compared to this, the Congress was able to get 47.8 per cent of the SC votes in 1971. The Left parties together polled 11.6 per cent and 10.4 per cent while the BSP polled their 12.1 per cent and 10.9 per cent of SC votes in 1996 and 1998 respectively. Clearly, the BSP mostly depends on its SC votes as in 1996, 67 per cent of votes polled in its favour came from the SCs, while this figure was 60.6 per cent in 1998. None of the other parties solely rely on SC vote. The BJP

Notes: 1 Regional party here denotes the Telugu Desam Party (Naidu).

2 The vote percentages of the BJP include that of the BJP-Samata Party alliance. The votes polled by the left parties denote the votes polled by the CPI and the CPI(ML).

3 Regional party in Gujarat denotes RJP (Vaghela).

4 The regional parties in Haryana include Haryana Vikas Party and HLD (R).

5 The vote percentages of the Congress and the Left include that of the UDF and the LDF, respectively. The regional party here mentioned denotes Muslim League.

6 The vote percentage of the BJP includes that of the Shiv Sena. Here the left is represented by the CPI(M). 'Others' include the RPI which polled 4.1 per cent of SC votes.

7 In Punjab the regional party indicates the Shiromani Akali Dal (Badal).

8 The percentage of vote for the regional party represents the votes of the DMK-TMC alliance.

9 The vote percentage of the regional party denotes that of the Samajwadi Party (Mulayam Singh).

10 The percentage of BJP votes include that of the Trinamul Congress. BJP polled 14.7 per cent and the Trinamul Congress 13.3 per cent of the SC votes.

11 Regional parties are included independent of their alliances.

cornered approximately 13 per cent of the SC votes during both 1996 and 1998 elections as against 45.6 per cent and 38.4 per cent of its votes coming from the upper castes in 1996 and 1998. The Congress, the Left Front, the Janata Dal/Rashtriya Janata Dal, and the BSP together accounted for 60.7 per cent and 58.1 per cent of the SC votes polled all over the country in 1996 and in 1998 respectively. These are the parties that polled larger percentage of the SC votes as compared to their overall vote sharing. Thus, the secular, Left and left-of-the centre parties have together emerged as the choice of the SC voters during the general elections of 1996 and 1998.

In UP, the rapidly emerging BSP captured most of the SC votes. In the 1996 elections, the BSP polled 59.5 per cent of SC votes while the Congress, the BJP, the alliance of Samajwadi Party and Janata Dal could manage only 9.4, 10.4 and 10.3 per cent respectively. In 1998, the share of the BSP in SC votes registered a decline of 9 per cent, while the BJP improved its SC vote share by 8 per cent. In 1996, the Left Front walked away with 61.6 per cent of SC votes in West Bengal, leaving the Congress to rest content with 24.7 per cent of SC votes. While the SCs' preference for the Left Front has remained steady, an important change was observed when the Congress vote base among the SCs sharply declined to 10.7 per cent. The gains, instead, were made by the breakaway Trinamul Congress. In Kerala, the LDF proved too good for the Congress in 1996 as their respective voting percentages among the SCs were 69.2 per cent and 20.5 per cent. In 1998, the LDF further improved its SC vote share at the cost of the Congress. In the 1996 elections in Tamil Nadu, the DMK-TMC alliance convincingly won the confidence of the SC voters. They took away 68.1 per cent of SC votes whereas the Congress-AIADMK alliance could do no better than polling 21.3 per cent. However, in 1998, the DMK-TMC alliance had to content with 41.5 per cent of SC votes, while the Congress suffered further erosion of its base among the SCs.

In 1996, the SC votes were divided in the multi-polar contests that ensued in Bihar, Madhya Pradesh and Maharashtra. In Bihar, the Janata Dal and its allies got 24.1 per cent, the BJP-Samata alliance 18.4 per cent, Congress 14.9 per cent and CPI(ML) 14.2 per cent of the SC votes. The erosion in the Congress votes amongst the SCs is once again more than evident. In its strongholds, for example, in Arrah and Aurangabad parliamentary constitu-

encies, the CPI(ML) got 37.7 per cent of SC votes which is more than the party's percentage of total polled votes. In Madhya Pradesh, the Congress got 28.1 per cent, BSP 22.9 per cent and BJP 11.5 per cent of the SC votes. Similar trend is observed in Maharashtra's sample. In 1998, the Congress made massive gains in MP and Maharashtra. Its SC vote share soared to 40.4 and 46.9 per cent respectively. In MP, the BSP also consolidated its position. In Bihar, the RJD emerged as a strong force among the SC voters.

In 1996, the Janata Dal was able to get 25 per cent of SC votes in Karnataka. The percentage of SC vote share for major parties/alliances in some other states was as follows: the Telugu Desam-Left alliance: 37.3 per cent in Andhra Pradesh; BJP-HVP-Samata alliance: 36.6 per cent in Haryana; the BJP: 36.5 per cent in the state of Delhi; the Shiromani Akali Dal: 21.1 per cent in Punjab. In 1998, the Congress won the lion's share of the SC votes in Karnataka (58.9 per cent), while the BJP too improved its position with 14.4 per cent of SC votes. While no major changes were observed in AP, in Haryana the Congress succeeded in getting 58.1 per cent of SC votes. Similar trend was observed in Delhi, where Congress got 67.9 per cent SC votes, mostly at the expense of the BJP and other parties. In Punjab, interestingly, both the Congress and the BJP-SAD alliance registered a decline in their SC votes, as the BSP cornered 18.2 per cent of SC votes.

In the case of Gujarat, the survey data are not helpful since large number of the

respondents refused to disclose their party preference in 1996. However, the available figures suggest that the BJP got 37.8 per cent of SC votes as compared to 21.6 per cent by the Congress. In 1998, the Congress improved its performance with 39.1 per cent of SC votes though the BJP remained ahead with 41.3 per cent of SC votes. As far as Himachal Pradesh is concerned, the sample size in 1998 was too small to suggest any trend. In 1996, 75 per cent of the SC votes had gone in favour of the Congress.

The inference to be derived is that the Congress has lost its support base among the SC voters mostly to the Left, or, to the BSP and the regional parties. The BJP has failed to make big inroads among the SCs. As for the SCs' preference for the victorious/emerging regional parties, it reflects the general trend of choosing non-Congress option. The question arises, how to classify the regional parties in the days of shifting alliance politics? Many of the regional parties that were averse to the BJP during 1996 election or before the 1998 elections, have now joined the National Democratic Alliance (NDA) led by the BJP. I have still preferred to classify majority of them as 'Left-to-the Centre' parties insofar as their basic character remains secular.

In conclusion, the party preference among the SCs varies from state to state. In this respect, the SC politics is passing through a phase of transition. Parties must compete to win over their votes, and the dalits seem to have understood the importance of their collective strength in

TABLE 4: INDICES* OF INFLUENCE ON PARTY PREFERENCE, 1996

	Party Preference						Standard Deviation
	Congress	BJP	JD	LF	BSP	Others	
<i>Age-wise</i>							
Up to 25 years	99.13	108.93	100.92	88.04	120.72	86.90	12.82
26-35 years	94.16	100.37	98.94	111.63	101.79	101.70	5.74
36-45 years	106.30	105.97	87.93	95.51	78.80	105.36	11.42

56 years or above	110.84	91.02	107.27	89.32	85.20	103.08	10.62
Standard deviation	7.28	11.54	8.87	12.80	16.29	9.32	
<i>Sex-wise</i>							
Male	97.02	103.52	104.32	102.78	108.64	93.13	5.56
Female	103.25	96.16	95.28	96.97	90.57	107.49	6.07
Standard deviation	4.40	5.20	6.39	4.11	12.78	10.15	
<i>Locality-wise</i>							
Rural	95.97	81.12	103.39	118.98	107.70	103.09	12.62
Urban	115.71	173.61	86.80	26.03	69.97	87.96	49.18
Standard deviation	13.95	65.40	11.73	65.72	26.68	10.70	
<i>Class-wise</i>							
Very Poor	96.82	60.48	137.72	123.44	81.07	127.70	30.16
Poor	101.89	114.04	59.42	89.64	137.12	73.51	28.06
Middle	111.56	161.14	74.73	54.28	93.41	70.27	38.28
Rich	75.30	268.95	43.66	63.42	58.21	79.27	84.64
Standard deviation	15.33	88.65	41.23	31.03	33.16	26.93	

Note: * The calculation is based on age group (partywise)/party total \times grand total/age group total \times 100.

electoral bargain. At least in the states where they are larger in number, their votes have acquired increasing significance in deciding the electoral outcome. No party can take them for granted. Only in the Left-ruled states of Kerala and West Bengal (the small sample size of Tripura did not permit statistically valid analysis), the Left is well entrenched among the SCs.

However, this shift in SC voting towards the left and non-conservative parties is very remarkable. Rejection of the Congress by the SCs in many states particularly in UP and Bihar symbolises their rejection of the vertical integration process perpetrated by the upper castes. This is the most important change manifested during the 1996 parliamentary elections and the process continued in 1998. It would appear that the SCs no longer follow the voting preference of the upper castes or the local notables that characterised the elite politics of the first four decades since independence. In fact, no party in these two states could replicate the upper caste-SC coalition formed earlier under the Congress leadership. This shift signifies a rupture in the patron-client relationship, at least in the realm of party politics.

INFLUENCE OF AGE, SEX, LOCALITY AND CLASS ON PARTY PREFERENCE

A further break-up of the SC voters according to age, sex, locality and class throws light on the undercurrents of the transitional process. The SCs cannot be considered as one homogeneous group, and their internal divisions do influence their party preference. Let us take the indices of influence developed for 1996 (Table 4). As the data reveal, the background of the voters preferring the Congress shows least bias for age, sex, locality and class divide. In this sense, the Congress still has an all-encompassing appeal. All the other parties have narrow, partisan vote base in terms of the divisions mentioned above. But more important is to understand the changing partisan characteristics of the SC voting pattern.

Age, on the whole, seems to have little impact on the party preference of the SCs. The most consistent age group seems to be of the 26-35 years whose vote is by and large evenly distributed among all the major parties. In other age groups, the standard deviation is slightly higher but more or less equal. In the age group of up to 25 years, the BSP is the most favoured party followed by the BJP, the left being the least favoured party. Standard deviation is the least in case of the Congress implying that it is the only party whose voters are evenly distributed among all the

age groups. Standard deviation is the highest in the case of the BSP. The BSP and the BJP are more favoured by the voters in the younger age groups. On the contrary, the left parties and the JD are preferred mostly by the older age groups.

There is little variation in the pattern of the party preference by male and female voters. The standard deviation is only 5.56 and 6.07 for male and female voters, respectively. However, greater variation is found in the case of the BSP. It is a party preferred more by men than women. The same is the case with other parties also. The converse is true for the Congress which is still favoured more by women than men.

On the other hand, the rural-urban divide has strong influence on SCs' party preference in the elections. The variation in the case of urban votes is very large. There is a strong preference for a particular party and rejection of others in the urban areas. The standard deviation shows exceptionally high figures for the BJP and the left. Although the BJP has expanded in to the rural areas, its vote base is concentrated in urban areas. The gap in the urban indices is close to 100. The left is almost confined to rural areas with negligible supporters in urban areas. The BSP's constituency is also more rural than urban. The Congress and the JD show consistency in terms of votes in both the rural and the urban areas.

However, the strongest influence on voting preference is observed in terms of class division. Uneven distribution of the voters is found in all class groups. The most uneven distribution of voters is in the middle, and of course, the rich class. The BJP is highly preferred among the middle class and the rich SCs. The BSP, the left and the Janata Dal are clearly the favourite parties of the poor SCs. The Congress is the exception in the sense that it has a wide vote base across all the class groups. Since the middle and the rich classes constitute a small section of the SCs (Table 1), there can be no doubt that the changed preference for the BSP, left or the RJD/JD is a marker of the assertion of the poor and deprived among them.

As against the 10 per cent of the lower class SC votes going to the BJP, 22.75 per cent of the middle and upper class SCs preferred to vote for the BJP. Conversely, only 7.21 per cent of the SC voters belonging to the middle and upper classes voted for the BSP. From among those claiming to vote for the BSP, 85.3 per cent belonged to the lower classes. Similarly, 83.6 per cent, 84.2 per cent, 73 per cent and 90.1 per cent votes out of the total SC votes polled by the LF, the JD, the Congress and the regional parties respectively came from lower classes among the dalits. In case of the BJP, this figure is 56.5 per cent. The BJP and the Congress accounted for 56.5 per cent of the middle

TABLE 5: INDICES OF INFLUENCE ON PARTY PREFERENCE (1998)

	Party Preference						Standard Deviation
	INC	BJP	JD/RJD	LF	BSP	Others

TABLE 6: PERFORMANCE OF BSP, 1996 AND 1998

State	1996		1998	
	Seats Won	Total Vote (Per Cent)	Seats Won	Total Vote (Per Cent)
Punjab	3	8.96	-	12.65
Madhya Pradesh	2	6.73	-	8.70
Haryana	-	6.59	1	7.68
Jammu and Kashmir	-	5.95	-	5.05
Uttar Pradesh	6	20.16	4	20.90
All India	11	3.8	5	4.68

and upper class SC votes. Another 15.1 per cent SC votes in this class group are accounted for by those who did not divulge their party preference. Interestingly, the upper class belonging to the SCs resembles the upper class of the upper castes in terms of their voting preference. The election data also show that the lower class belonging to the upper castes voted relatively more in favour of the Congress, the Janata Dal and the Left parties. In this sense, the BJP may be termed as not only a party of the caste Hindus, but also as a party of the upper class cutting across all caste groups. The poor SCs prefer parties known for taking up the cause of the weaker sections. Thus, there has been a two-directional shift in the SC votes – the poor SCs preferring for the broad left and the well-off SCs opting for the BJP and the Congress.

This trend has serious implications for our understanding of caste-class discourse. What are factors behind the newly-found attraction among the upper middle and middle class SC voters towards the BJP? With further economic differentiation, what will be the future of the bahujan coalition of the SCs, STs, lower class Muslims and most backward and other backward castes? Is the question of identity and self-respect adequately addressed by economic prosperity? Can this trend be explained by concepts like elite emulation and imitative reference group or should it be taken as simply a case of class transcending caste? These questions cannot be addressed properly by the election data alone. However, they require attention of all researchers concerned.

In the 1996 elections the BSP enjoyed greater probability of support amongst the youngest age group. This support base has since then enlarged (Table 5). Similarly, amongst the supporters of the Left Front, the probability of support among the older age group has increased further. However, the most important change is that the lowest SD is observed in the case of BJP, meaning that its support base is more evenly distributed among all the age groups than other parties. Till 1996 this was the feature of the Congress. Another new feature is the high SD value in the age group of up to 25 years implying that this is the most unstable age group in deciding its party preference. The age group of 46-55 years comes next in exhibiting much volatility.

As far as the influence of sex division on voting behaviour is concerned, the support of males and females is largely evenly distributed among parties as it was during 1996 (Table 5). However, the change is discerned in the support for the

LF among females. It shows that more women are likely to be influenced to support the party than men. The SD for the BJP has risen because its influence among the male voters has gone up. Otherwise, the SD for all other parties have decreased indicating a trend of sexwise homogenisation in the support base of the parties.

As far as the rural-urban divide in vote base is concerned, the urban voters still remain in a situation of flux, though their instability has reduced considerably since 1996. As far as parties are concerned, except for the RJD/JD, the SD has declined in case of all other parties. RJD/JD seems to have cast further influence in rural areas while their influence amongst the urban voters has gone down. The LF has improved in its vote catching probability in urban areas dramatically. However, most remarkably, the BJP has improved its influence in rural areas though there is a decline in its influence over its traditional urban voters. To conclude, the indices based on the 1998 data show that the BJP is undergoing a transformation, and more and more acquiring the characteristics of the Congress, enjoying wider support base cutting across age, sex and locality.

THE RISE OF BSP

The BSP's improved performance has been one of the remarkable features of the 1998 elections. This is a typical case of the SC assertion in electoral politics through a party which mainly has a base among them. In 1996, 67.4 per cent and in 1998, 60.6 per cent of the BSP's votes came from the SCs. In the states of UP, Haryana, Madhya Pradesh and Punjab, the party performed exceedingly well. Particularly in UP it performed exceptionally well, both in terms of the vote share and the number of seats it won. The 1996 all-India election figures show that the BSP contested 201 seats, won 11 seats and was able to get 3.8 per cent of the total valid votes. Of the 11 seats, the BSP won six seats in UP, three in Punjab and two in MP. Of these 11 seats, only three belonged to reserved constituencies. Of the all-India SC votes the party's share was 12.1 per cent. The EC's data show that the party secured 20.16 per cent of total votes in UP. There were 52 seats in the state where the party polled more than 1,00,000 votes. The party stood second in 17 seats and secured more than 20 per cent of total polled votes in 46 seats.

The BSP's vote share has shown steady increase. In the 1985 assembly elections the party got 4 per cent of total votes which

rose to 9.4 per cent of total votes in the 1989 assembly elections, 9.9 per cent in the 1991 Lok Sabha elections and 10.8 per cent in the 1993 assembly elections.² During the 1998 elections, the party performed even better in terms of percentage of votes it secured, though in terms of seats, it lost considerably. It contested 249 seats, won 5 and secured 4.68 per cent of total valid votes.

The BSP's vote share increased in all the four states, namely, UP, Punjab, MP and Haryana where the party is known to have a strong base (Table 6). It secured more than one lakh votes in three constituencies in Haryana, nine constituencies in MP, four constituencies in Punjab and 66 constituencies in UP. The party polled more than 20 per cent votes in as many as two constituencies in Haryana, six in MP, 43 in UP, and more than 40 per cent votes in all the four constituencies of the Punjab it contested.

The BSP has emerged strong in states where there is sizeable concentration of SC population. According to the 1991 Census, the SCs constitute 21.05 per cent of the UP population, 28.31 per cent of Punjab population, 14.5 per cent of MP population, 19.75 per cent of Haryana population. All India average of SC population to the total population is 16.48 per cent. Other states with SC population above the all India average are HP (25.3 per cent), Rajasthan (17.3 per cent), Tamil Nadu (19.2 per cent), West Bengal (23.6 per cent) and Delhi (19.1 per cent). In the first two states Congress has a comfortable hold over SC votes. In the next two states respectively the DMK-TMC alliance and the CPI(M) enjoy a stronghold. In Delhi, the Congress and the BJP are contending for the SC votes. The BSP is nowhere in the picture in these states. Bihar, Andhra Pradesh, Orissa, Tripura, Karnataka are the states where the SC population is near to the all India average. In these states too the BSP has no foothold. But importantly, in contrast to 1996, for the first time in 1998, the BSP succeeded in attracting backward caste votes. For example, in UP, despite decline in its SC vote share, the BSP's total vote share increased because of additional backward caste votes cast in its favour. One possible explanation is that the number of SC candidates fielded by the BSP in 1998 has come down while the share of its backward caste candidates grew.

Dalit assertion in party politics and governance through their own party is not a new phenomenon. The Jatavs in the Agra region keenly followed the debate of dalit emancipation between Gandhi and

Ambedkar. In 1944-45, they formed the Scheduled Castes Federation (SCF) of Agra which was linked to the All India SC Federation. Till the formation of the RPI in 1958, the dalit politics in UP kept swinging between the accommodative policies of the Congress and the radical politics of the SCF. These two tendencies of integration and separatism were to remain in the SC movement in the post-colonial India [Pai forthcoming]. The RPI phase lasted merely a decade. The RPI's influence was confined to UP and Maharashtra. The party won three parliamentary seats and eight assembly seats in UP in the 1962 general elections. Its performance was marginally better in 1967 when it won 10 assembly seats. After winning only two assembly seats in the 1969 election, the RPI finally declined to a non-entity in the subsequent elections. The 1970s is described by Sudha Pai as "a phase of integration and a hiatus between two periods of separatist political activity by the SCs in UP" [Pai forthcoming]. The Congress was able to co-opt both of them.

However, the BSP's emergence in the 1980s and the 1990s as a force to reckon with in the four north Indian states has its causality in the altered political context and the changes in the SC community itself. The steady decline of the Congress, which earlier used to more or less represent the majority of the SCs all over the country, created a political vacuum. This space has not been occupied by the BJP as it is dominated by the twice-born castes. Precisely because of this the SCs' party preference is quite dispersed among different parties. This may be true of some other marginalised social groups also, which probably explains the presence of not less than 30 parties in the 11th Lok Sabha.

It is necessary to dispel the commonly held belief that the BSP has a powerful electoral appeal among the urban educated middle class of the SCs. The figures on voters' background in UP for 1996 reveal that the BSP draws 62.7 per cent of its votes from non-lettered voters though they constitute only 44.8 per cent of the total sample of respondents. The next large share in BSP votes belongs to voters having secondary education. They constitute 27.4 per cent of total BSP voters. Voters, having completed graduation or above, constitute only 2 per cent of BSP voters though their representation in the sample is 5.6 per cent. In fact, only 6.3 per cent of the graduates preferred to vote for the BSP whereas this figure is as high as 51.3 per cent for the BJP. This finding proves that education has no direct connection to political consciousness. The assertion of

dalit identity in politics is essentially the assertion of non-lettered but politically conscious dalits.

Occupationally, the BSP's voters are mainly unskilled workers, agricultural and allied workers, artisans, and small and marginal farmers. Persons engaged in business and white-collar jobs constitute only 2.6 and 1.6 per cent of the BSP voters, respectively. The all India figures also resemble the trends observed in UP. For example, the all India figures reveal that 85.3 per cent of the BSP's votes come from the lower classes. Table 4 also suggests that the BSP is primarily a party of the rural poor.

The other party known for mostly representing the SCs is the Republican Party of India (RPI). In the 1996 parliamentary elections, the party emerged as the obvious choice of the SC voters wherever it contested elections in Maharashtra. Though the party failed to win a single seat, of the 11 seats it contested in the state, its vote share has been more than 20 per cent in five seats (the highest being 33.19 per cent in Akola constituency) and between 10 and 20 per cent of the polled votes in four other constituencies. The party polled more than 2 lakhs of votes in two constituencies (The Election Commission of India, 1996). But after entering into alliance with the Congress in the 1998 elections, the RPI won all the four seats it contested in Maharashtra. Its vote share in these constituencies ranged between 47-50 per cent. The Peasants and Workers Party of India (PWP) won the Kolaba seat in the coastal Konkan region of the state

by securing about 33 per cent of the total votes. However, in the case of Maharashtra, it should be remembered that dalits constitute only 11.09 per cent of the total population, making it imperative for any party to form a broader social and political coalition to succeed in the electoral fray.

LEGITIMACY OF POLITICAL SYSTEM: THE SC VOTER'S VIEWPOINT

Undoubtedly, what we observe today is a sharpening of political consciousness amongst the scheduled castes. Their participation in numerous movements suggests that their political vision is not restricted to electoral politics alone. In states like Bihar, Andhra Pradesh and parts of Maharashtra, Orissa and Madhya Pradesh, they have rallied behind the agrarian movement, the so-called 'Naxalite movement'. This movement has gained ground in a few other states also. In states like Gujarat and Maharashtra and at many places in other states, Ambedkarite organisations have become popular tools for the dalits to get organised. The left parties like the CPI(M), CPI, RSP, FB and the SUCI have succeeded in organising them in their mass organisations, particularly in the states of West Bengal, Kerala and Tripura, and parts of Assam, Andhra Pradesh and Tamil Nadu. The SCs working in the organised sector industries have been unionised by the trade unions. Though still a large segment of them, particularly in rural areas, remain unorganised and also suffer from intense internal divisions, the process of organisation, protest, mass

Announcement

Workshop on "Statistical Science and Environmental Policy: Possible Interactions", at the Indian Statistical Institute, Calcutta, 10-12 January 2000.

Organised by the Indian Statistical Institute and the Bernoulli Society, it aims at bringing together some of India's leading environmentalists and some of the world's leading environmental statisticians. The focus is on developing countries. The proceedings will be published.

All lectures are invited; there will be no contributed presentations. Audience participation is also limited. Please write to us by **31 October, 1999**, if you wish to participate. We cannot offer financial support but can help you find local accommodation.

For further information, contact: Barun Mukhopadhyay (Anthropology and Human Genetics Unit), Convener, Environment Workshop, Indian Statistical Institute, 203, B.T. Road, Calcutta - 700 035, FAX: 577-6680, E-mail: envconf@isical.ac.in

movement, and as a result, politicisation, is spreading. Above all, during the 1996 parliamentary elections the dalits were able to make remarkable electoral gains. This brings us to a situation where the SCs seem to be trying to reconcile two different approaches to political struggles – the parliamentary politics through elections and the politics of active opposition through various non-parliamentary means. This evokes both hopes and apprehensions regarding the credibility of the political institutions of Indian democracy. In this section I examine the perception of SC voters regarding the legitimacy of the political system which helps us understand why the recent political movements of the SCs tend to take the route of electoral politics and in the process reflect a justification for the political system.

The figures of both the election surveys clearly show the absence of any substantial difference between the SCs and the upper castes regarding their opinion about the efficacy³ of their vote. About 60 per cent of the SCs and 62 per cent of the upper caste respondents expressed faith in the power of their vote. In terms of class, the figures were, by and large, the same. The second important indicator of legitimacy of the system is the credibility of elections themselves. A sizeable proportion – 45.4 per cent of the SCs and 51.3 per cent of the upper castes – in 1996 expressed their faith in the usefulness of elections. The figures remain more or less the same in 1998. Classwise, 53.1 per cent of the SCs and 56.9 per cent of the upper castes belonging to upper and middle class, described elections as useful. The corresponding figures for the lower class in accordance to their respective caste groups are 43 per cent and 43.6 per cent. However, it is noteworthy that despite relatively high percentage of voting and moderate faith in the efficacy of vote, elections are yet to become the choice of the overwhelming majority as far as articulation of their political exercise is concerned. This may have resulted because of the persisting problems with the election system, like lack of choice for good candidates, absence of any accountability of the elected candidates, misuse of money and muscle power, etc.

Another indicator is the usefulness of parties in the perception of the voters. Political parties are the agencies for representing the electorate in power politics where public policies are determined. They provide the link between the civil society and the state. The quest for popular mandate casts onus upon the parties to influence the voter by articulating the issues and

demands of people's concern. It rather compels them to address all the available social cleavages and institutions. Significantly, only 41.4 per cent of the SC respondents accepted the usefulness of political parties in making government pay attention to them as against 46.9 per cent of the upper caste people. The response in 1998 was no different. Data reveal that those respondents coming from the upper and middle class background and expressing confidence in the usefulness of political parties happen to be 48.9 per cent from the SCs and 51.8 per cent from the upper castes. This is far more than the confidence level of their respective lower class respondents which is found to be 39.1 per cent and 39.9 per cent, respectively. During both the surveys, only 17 per cent of the SC voters confirmed meeting any political leader; only 20 per cent of them accepted knowing any leader personally. Figures in this respect are more or less similar for the upper castes, except that in 1998, 26.7 per cent of them acknowledged knowing any leader personally. When asked to respond to whether any political party cared for the interests of their caste group only 21.8 per cent of SC respondents and 18.1 per cent of upper castes responded in the affirmative in 1996. These figures were marginally better in favour of the SCs in 1998 as 24.4 per cent of them responded in positive compared to 15.8 per cent of the upper caste respondents. A similar response was noticed when an overwhelming majority (about 65 per cent) of both the castes responded in the negative during both the election surveys when queried about the party they felt close to. The upper and middle class are found better placed than the lower class in these respects.

Thus, the CSDS data reveal that the *legitimacy of the political parties is much lower than the legitimacy of the system in general*. The National Election Survey Report of the CSDS (1996) puts it as a typical example of *high legitimisation of the system and low legitimisation of the actors* [Singh 1996]. A contrast to this is to be noticed in the viewpoint of both scholars and political leaders in the 1950s and early 1960s who presumed the legitimacy of the new institutions as largely depending on the legitimacy of the parties themselves [Brass 1985:209]. One reason for distrust in political parties may be that, *a la* Max Weber, "the party is alive only during election periods. The parliamentary delegates and the parliamentary party leaders know to which local notables one turns if a political action seems desirable." We are also faced with a situation where

the upper class voters tend to participate less in direct political activities but have developed powerful stakes in the system. It points towards the continuing elitisation of Indian politics. The message is loud and clear to the political parties: they cannot take the present support of the SCs for granted. Low level of trust in the parties may lead them to chance further changes in party preference.

However, when the question, 'suppose there were no parties or assemblies and elections were not held, do you think that the government in this country can be run better?' was posed, an impressive 68.8 per cent of the respondents cutting across caste lines in 1996 answered in negative whereas this figure stood at 43.4 per cent in 1971 [CSDS data unit, Delhi]. Although no baseline is available, it can be safely presumed that the increase in percentage mainly comes from the weaker sections of the society, namely, the SCs, STs and the OBCs. Still, 74 per cent of the upper caste respondents approved this system as against 67.3 per cent of the SCs. The response remained almost the same during the 1998 elections. This finding is important to resolve the conflicting responses we observed with respect to the legitimacy of the different political agencies and institutions. This goes to show that despite being dissatisfied with different agencies of the system, the SCs discern no clear alternative to the multi-party parliamentary democracy. This gives them an added impetus to assert themselves as a political bloc in the electoral arena. On the whole, the Indian political system enjoys moderate legitimacy among the SC electorate, deriving legitimacy largely from the upper and middle classes than from the lower stratum. Nevertheless, its legitimacy among the lower castes has been increasing. This perhaps partly explains the reason why the SCs are thronging the electoral booths as never before.

CONCLUSIONS

There is an effort on the part of the SCs to carve out a distinctive political niche, indeed an identity, insofar as their voting behaviour is concerned. Recent efforts of the SCs to assert in the electoral politics show their concern to gain political strength in order to occupy political and economic space. To them political power may also work as a source of enhancing social status. However, any effort by the SCs to assert politically is bound to face stiff opposition – physical as well as political. The SCs in response to these hindrances seem to have adopted multi-dimensional strategies which range from social mea-

tures, like getting educated, to getting organised for both electoral as well as non-electoral battles. Recent efforts by the SCs to put their firm signature on electoral outcomes emerge as a culmination of their consistent struggle and collective strength.

There is a definite pattern in the party preference of the SCs who have gradually shifted from the Congress and opted for alternatives wherever they could find them. This change in allegiance is more guided by the secular concern to assert in the power structure in order to gain benefits that may accrue from it, than by mere parochial interests. This has led them to search for alternatives as they are no longer prepared to accept the role of a passive voter-supporter in the overall environment of subjugation and subordination. They have realised that the Congress Party has politically nothing to offer beyond the traditional loaves of rhetoric. At the same time, they are tactful enough not to opt for any party irrationally or indiscriminately. They are not intransigent either.

Exercise of voting right and its effective application to strengthen exclusively SC-based parties like the BSP, and the left and the left-of-the centre parties have been major highlights of their political rise. Internal cleavages within the SCs are largely manifested in terms of growing class differentiation within them. However, both the lower and the upper classes of the SCs are in the process of change so far as their party preferences go, with the former mostly inclining to the left and the latter to the rightist BJP.

Political institutions of Indian democracy seem to enjoy the support of the SCs but the political actors stand more or less discredited. This is an alarming signal for the political parties for they cannot afford to take the present overwhelming support of the SCs for granted. They will have to show genuine concern for the issues of the SCs lest the SCs may find the non-parliamentary path of struggle more rewarding than the electoral battles.

Notes

[This paper is based on the 1996 and 1998 national election surveys (NES) conducted by the Centre for the Study of Developing Societies (CSDS). The author is thankful to the CSDS for allowing him to use the NES data. This study was sponsored by the Centre for Social Studies, Surat. The author is thankful to Ghanshyam Shah, Jean Dreze, Prathma Banerji and Robert S Jenkins for their comments on the earlier drafts of the paper. The author also acknowledges the support and assistance of V B Singh, Sanjay Kumar, Himanshu

Bhattacharya, Arun Kumar, Anup Kumar Karan and Pankaj Naithani at various stages of the study.]

- 1 A very high percentage of 87.3 per cent overall voter turnout was reported in the CSDS sample as against the actual figure of 57.9 per cent. The CSDS Report (Report of the National Election Survey, 1996 submitted by the CSDS to the Indian Council of Social Science Research) clarifies this gap as follows: "Since voting is generally considered an act of responsive citizenry, there is a tendency of slight over-reporting in all such surveys. However, a wide gap of about 30 per cent in the present survey can be explained largely by two factors. One, span of survey period in a given locality was restricted to about 30 hours only including the night falling in between the two days. Therefore, only those present during this period harring refusals were interviewed. The people thus interviewed distinguish themselves as generally present in the locality and thus more likely to vote than others. Fully aware of this problem the interviewers were asked to ascertain, at least, voting-non-voting information about not interviewed respondents as well. Interestingly, only 36.9 per cent of the not interviewed respondents were found to have voted. This brings down the turnout figure from 87.3 per cent to 70.6 per cent. Finally, as by-product of this survey we came to know that as much as 12.7 per cent names in the voter list were non-eligible voters. That is, either they were dead, permanently migrated, working and residing far away from their native place or

were untraceable to the extent that they could be characterised as ghost voters. If these non-eligible voters too are excluded from the potential list of voters the actual turnout figure goes up from 57.9 per cent to 66.2 per cent which is very close to survey revised figure of 70.6 per cent."

- 2 Data released by the Election Commission of India on the respective elections.
- 3 This concept was first well developed by election analysts at the Survey Research Centre at the University of Michigan in the form of a scale of political efficacy, and subsequently applied in electoral research in many countries.

Dialectics of Caste and Casteism

C P Bhambhri

POLITICAL parties and intellectuals of every theoretical and ideological persuasion have to grapple with the changing dynamics of Indian caste system and Javeed Alam in his *'Is Caste Appeal Casteism? Oppressed Castes in Politics'* in *EPW* (March 27-April 2) has extended the frontiers of intellectual discourse on 'caste' by suggesting that "a few positive things in the politics of the oppressed communities/castes" have been ignored by a section of the middle class intelligentsia. Javeed in his presentation has maintained that under the impact of very powerful process of ongoing changes in the Indian society, the oppressed castes "have become a community in every sense of the term" (p 759). Javeed suggests that the oppressed castes are in search for equality and in the process they are least concerned with Hindu ritual system and "it is the upper castes of 'dwijas' who still refer to themselves as brahmins or thakurs" while the oppressed castes may be using Hindu symbols for 'mobilisation for power'; otherwise as newly 'emergent communities in India' the oppressed are fighting for equality in society.

Our understanding about caste in Indian society is that changes within the caste hierarchy cannot be properly appreciated without situating all castes and subcastes in the overall ideological umbrella of Hindu religion. Every caste and subcaste and Hindu religion of every variety are integrally interlinked and interrelated and if Javeed's claim that the oppressed castes have 'become a community in every sense of the term' has to be accepted, a few more questions will have to be asked and answered for understanding the inner dynamics of changes within the Indian caste system. Karl Marx had alerted us in his *German Ideology* and *Contribution to the Critique of Political Economy* that social ideologies do not hang in the air and they are powerfully linked with the material foundations of a society. "It is not the human consciousness that determines the being but social being that determines the human consciousness", is an apt approach to study caste in India. Caste is an ideological superstructural arrangement of Hindu society and caste has been used as an instrument for the 'extraction and appropriation of surplus value' in Indian

agrarian social structure. Caste is both an ideological superstructure of Hinduism and it is also an integral part of the "social base of material arrangements of 'cellular' kind of caste organisations evolved by Hindu social and economic order which has been inherited by us even during the phase of 'capitalist development of post-independent India'. Our major submission for the consideration of scholars studying recent developments within the oppressed castes is that Hinduism of every variety is very much in existence as a reference point of the worldview of the oppressed castes. A few facts may be mentioned to substantiate the statement that the post-Mandal developments of the 1990s have in no way transformed the Hindu religious worldview of the dalit castes. P V Ramaswamy Naicker launched a big renaissance movement against brahminical Hindu ritualised religion and achieved a lot of success in liberating the oppressed castes in Tamil Nadu from the ideological control of Hindu religion. The Dravidian parties in the 1990s are moving away from the anti-brahminical movement of Ramaswami Naicker towards collecting money for a temple renovation fund. It is not only Jayalalitha who is busy promoting the training of priests in Vedic knowledge. K Karunanidhi had to publicly rebuke one of his own ministers who was found performing traditional Hindu rituals in his house. The Dravidian ideology of anti-brahminical Hinduism has witnessed a great reversal in the 1990s and Tamil Nadu is witnessing a great revival of Sanskritic brahminical Hinduism. While the 20th century Dravidians of Tamil Nadu and the oppressed castes of Maharashtra witnessed social and intellectual renaissance and reform movements, the oppressed castes of Bihar, Uttar Pradesh and other north Indian states did not have any powerful movement which critiqued brahminical Hinduism. The consequences have been that the oppressed castes even in the process of democratic political change continue to remain under the influence of Hindu priests and practise Hindu caste rituals as specified for each jati and upjati. India has witnessed during the 1990s a simultaneous growth of dalit assertion and consciousness and also a revival of ritualised Hindu religion which is openly

practised by every caste and subcaste in the villages, small towns and cities of north India and the oppressed castes remain part of Hindu religious system even at the close of the 20th century. A demand for the appointment of dalit priests for Hindu temples by dalit organisations and their leaders substantiates the argument that temple-boycott is not the agenda of the oppressed castes but temple entry is still a part of their struggles in many parts of the country. Valmiki Ramayan, Valmiki temple or worship of Krishna by the yadavas or other Hindu gods and goddess preferred by dalits is an integral part of the agenda of dalit castes. Dalits are establishing their own distinct 'casteist' identity on the basis of their distinct religious and cultural symbols based on the umbrella religious system known as Hinduism. It is not frivolous when tallest leaders of the oppressed dalit castes compete with the leaders of the hindutva forces for placating the Hindu gods and goddesses during their visits to reach their voters. 'Jai Sri Ram' of the hindutva forces is countered by 'Jai Sri Krishna' of the dalit leaders. The 1990s have witnessed a simultaneous growth of the distinct social consciousness of the dalits along with the new caste and community religious assertions of the whole Hindu hierarchy. The development of this 'dual' and interrelated phenomenon of assertion of dalit identity and assertion of Hindu religious casteist identities during the 1990s has to be examined dialectically because the positive developments of dalit consciousness have been negated by the emergence of the renewed appeal of Hinduism to every caste group in India. It will be very simplistic to maintain that brahminical Hinduism as an ideology of the ruling castes is threatened by the dalit communities which are searching for social equality. The subaltern castes, by and large, are fully integrated in the Hindu religious worldview which provides and justifies the ideology of casteism. The new dalit castes are believers and practitioners of casteism while dealing with various levels of dalit caste formations and the sanction behind dalit casteism lies in Hindu plethora of gods and goddesses and priestly classes. Different dalit castes have different Hindu rituals which they practise in their family and group celebrations of birth and marriage. In the process dalit subcastes maintain social and ritualistic distance from other dalit subcastes on the basis of higher/lower scale within the dalits. The upshot

of above discussion is that Hinduism of any variety does not accept the principle of human equality even at an abstract level and this provides a sanction for the ideological basis for caste system. Since the dalits continue to be part of Hindu religious belief system, they practise the ideology of caste versus other castes and in the process dalit casteism has emerged in a big way. Otherwise one cannot explain the fundamental antagonism between Bahujan Samaj Party leaders like Kanshi Ram and Mayawati and the yadav socialist leaders like Mulayam Singh and Laloo Prasad Singh. Fragmentations among dalit castes have to be brought in while analysing the dynamics of changes within dalit castes and by ignoring this phenomenon, we will miss many important dimensions of the study of caste complexities in India. A phenomenon of new oppressor castes among the dalits has been observed while studying the politics of the backward caste middle peasantry in India. An antagonistic contradiction exists between the landowning dalits (backwards) and the landless agricultural workers and marginal farmers who are also dalits. Dalit's oppression of dalit is a social reality based on the objective economic relations prevailing in agrarian India. It is not without reason that the messiah of dalits like Laloo Prasad Yadav or Mulayam Singh Yadav like their high caste brahmin/thakur predecessors have not undertaken any land reforms during the 1990s and the real dalit is also not a beneficiary of reservations in public services as implemented on the basis of Mandal Commission recommendations. This significant development of the 1990s is continuing social fragmentation of the dalits and the real dalits are witnessing oppression by the landowning dalit castes along with the oppression of the traditional landowning castes whose power is declining because of the peculiar land reforms undertaken by the various state governments in India. Hence oppression and more oppression is the real social situation of the absolute majority of real dalits who are either landless agricultural workers or marginal farmers.

If dalit and oppressed castes are becoming 'communities' and new progressive social coalitions are emerging as maintained by Javed, the essence of these social changes could also be captured by bringing in the role of vanguard organisations, parties and leaders of the dalit castes. Marx and Lenin have alerted us about the role of parties of the proletariat in raising the level of working class consciousness in the process of class struggles and the famous statement of Lenin that

trade unions are the school of socialism for the proletariat deserves to be kept in mind. What is the type of leadership of dalit parties and movements in India and what kind of struggles have they launched to raise the level of consciousness of the dalit castes? V P Singh as a leader of the faction of exploiting classes and castes in his factional fights against some other factions of the dominant classes and castes implemented Mandal Commission recommendations for reservation of public services for the dalits in April 1990. It is a well known fact of bourgeois praxis of politics that factions of the ruling class leadership fight populist battles against other factions of ruling classes especially in a situation when revolutionary politics of the peasant and workers is not present on the national social agenda. The impact of V P Singh in Mandal politics was that the elite of the upwardly mobile dalit castes became very active because they were the beneficiaries of the new reservation politics for the backward castes. Similarly, the Bahujan Samaj leadership of Kanshi Ram and Mayawati mobilised the other backward-dalit castes who felt very protected under their party and the Anti-Atrocities Law was effectively implemented under the Bahujan Samaj leadership.

This is the track record of dalit politics of the 1990s. Caste versus caste mobilisation has made Indian society extremely caste conscious. Dalit oppressors and dalit oppressed are involved in bitter struggles in rural India, such as thevars of Tamil Nadu, or jats of western Uttar Pradesh are exercising their dalit political power against their antagonistic dalit social castes of the landless agricultural workers and marginal farmers. The Ranbir Sena of the high caste oppressors in Bihar cannot successfully liquidate the real dalits without some linkage with Laloo Prasad Yadav/Rabri Devi state government of Bihar which has been in power in the 1990s. Social antagonisms in India are perceived through caste consciousness and struggles to settle social antagonisms are launched by caste mobilisation. Caste remains a reference point of social power, deprivations, grievances and in the process caste relations get strengthened and solidified, and in this process caste gets converted into pure casteism. This is the reality of contemporary India and dalit leaders and ideologues have presented caste as a dominant factor of privileges and deprivation and the ongoing caste struggles have strengthened caste feelings and identities. Further, Hindu religion has provided a holdall platform to all the dalit

castes to operate in the overall structure of inequalitarian-ritualised Hindu belief system.

If one were not to fall in the trap of 'Philosopher Karl Popper's piecemeal social engineering strategy' or sociologist Talcott Parsons' theory that 'social change is an ongoing process' and human history has not witnessed any Hobbesian war of all against all, the task of Marxist social science is to relate the struggles of the oppressed castes in the framework of the nature of social and economic antagonisms of rural India. The material foundations of social antagonism in rural India are linked with the land question and the numerous dalit castes are fragmented in their relationships on the basis of ownership or absence of ownership of land. Dalit castes involved in the process of extraction and appropriation of surplus value on the basis of ownership of land are in an antagonistic relationship with those who work on land for their livelihood. Caste as an ideology is primarily linked with landownership and Hinduism sanctifies this ideology of caste domination and oppression. During the 1990s new dalit assertions have emerged in India and they deserve to be welcomed because it is a step forward in social change. It is quite hasty to jump at conclusions without seriously examining the relationships of dalit ideology, Hindu religious revival and dalit versus dalit oppressions on the basis of social antagonisms prevalent among the dalit caste groups. Caste in India operates as casteism because social antagonisms, both horizontal and vertical, are perceived and internalised on the basis of specific castes or groups involved in various struggles in society.

Caste continues to be sustained at an ideological level by Hinduism and at a material level by the prevailing land relations in agrarian India and caste has no potential for a socially progressive role unless its sustaining structures are completely weakened and broken. This is the essence of survival of caste in different reincarnations.

**NEED AN EXTRA TONNE OF CEMENT DELIVERED BY TOMORROW?
PLEASE DO NOT CALL US.**

Once you order ACC Bulk Cement, a customer service officer will call you everyday (a small service to make your life easier). You can inform him of sudden requirements, changes in your order or even specify the time you would like your cement delivered.

Our new fully mechanised Bulk Terminal at Kalamboli helps us do this more effectively. To begin with, it's within easy reach of most sites at Mumbai, Raigad and New Bombay. As soon as the customer service officer calls in with your order, a sealed bulker

is loaded with cement and despatched to your site, so that you receive the cement when you need it. We call this 'Just In Time' delivery, a concept that is the norm in every advanced country.

If you're interested in using ACC Bulk Cement,

do call us at 282 6913. It may be the last time you have to phone us.

ACC BULK

CEMENT. WITHOUT THE HASSLE.

**UNFPA****United Nations
Population Fund**

CALL FOR PROPOSALS

The United Nations Population Fund (UNFPA) as part of its Fifth Country Programme of assistance with the Government of India, is supporting research studies in Population and Development under project IND/99/P12 – Policy and Programme Research in Population and Development in India.

1. **Urbanisation forecasts at national, state and district levels:** Proposals should consider modeling which links economic growth and urbanisation. National and state-level forecasts are required; the possibility of district or sub-state level forecasts may also be proposed. The research would be based on secondary data and modeling and would require expertise in economics, especially modeling, and demography.
2. **Population & Environment:** The primary focus here is on the impact of population growth on water supply. This would involve first an assessment at the macro-level, for states and regions of the country, which could be done using secondary data. However, to understand the implications at the micro level, for villages, households and women, primary data may need to be collected. The project would require the involvement of scientists familiar with water resources, demography, and survey and anthropological methodology and may well require an interdisciplinary approach.
3. **Sex ratio, sex selective abortions:** The observed imbalance in the sex ratio in India could be attributable to sex ratio at birth and sex differences in age-specific death rates which are influenced by sex-selective abortions, infanticide and neglect. There is a need to make a detailed demographic assessment of sex composition by age to assess possible distortions caused by sex-selective mis-reporting and omission. A quantitative assessment of extent of foeticide and infanticide and their impact on sex ratios at birth and population can follow. Anthropological studies or focus-group discussions in areas known to have sex-selective foeticide or infanticide may be helpful. The project would involve detailed analysis of secondary data, records and micro-research. Expertise in technical demography, micro-research and familiarity with recording systems is essential.
4. **Consequences of fertility decline:** Recent studies have demonstrated how fertility declines benefited the economies of east and South East Asia. A similar approach could be used to estimate the impact of the slowing of the growth rates in certain Indian states such as Kerala, Goa and Tamil Nadu. This research might also use modeling to estimate quantum benefits of lower maternal and infant mortality, lower levels of unwanted pregnancy and child birth and fewer unsafe abortions. An economist or a population economist or economist-demographer team should conduct the research.
5. **Cost-benefit Analysis of Population Programmes:** When a programme provides comprehensive services as the Indian health and population programme does, a birth prevented saves further programme costs in related areas. For instance a Mexican study has estimated such savings using data on costs from health insurance programmes. For India, such data on unit costs of maternal and infant health care are not readily available although some recent surveys give some data on expenditures on health care. Thus the research could make use of the available secondary data and collect some additional data on costs. The project would require expertise in health economics and demography.
6. **Role of Panchayats:** A survey of panchayats would provide information on composition, finances, achievements and whether women and weaker sections are adequately represented. A sample of few panchayats can be taken up for detailed study. Such a study can also answer the question of ability of panchayats to raise funds to provide quality services. The involvement of panchayats in the health and population programmes is in varying degrees in different states. Therefore a cross section of two or three states representing the differing degree of involvement may be selected for the study. Researchers with experience in public administration and development issues may be involved in the project.
7. **Sexual Behaviour of Rural Population:** Health and population surveys rarely include a component on sexual behaviour because of apprehension of refusals to questions that may be sensitive or embarrassing. Hence, there is a need to adopt other methodologies. Social anthropological approaches in-depth interviews and focus-group discussions may be more appropriate techniques to gather such data. Naturally, this would mean that only a few sections of the population could be covered. A medical anthropologist or a team of demographer-social anthropologist would be needed to undertake this study.

Institutions interested in the project may send a preliminary proposal, not exceeding three pages, stating the name(s) of Principal Investigator(s), institutional affiliations, the study topic, issues to be researched, conceptual framework, research methodology, data requirements and data sources, time frame and the budget estimate. Proposals in the range of Rs 15-30 lakhs are being sought. Brief bio-data of the principal investigators need to be appended.

An expert team will screen proposals received. If short listed, a detailed proposal would be requested later. Collaborative research is encouraged. Total duration of the project should not exceed 24 months.

The preliminary proposals with all attachments need to be sent **on or before September 30, 1999.**

Vol XXXIV No 37 27th July - 1st August, September 11, 1999

Inside Indian Democracy

The processes around democracy in India have detached themselves from the infirmities surrounding democracy itself. The deepening legitimacy gained by democracy inheres in these processes which provide the space - now contracting, now expanding - for the range of resistance the people are capable of. This has been happening in spite of the shape that organised politics has acquired and points to the need for a radical revision of theories of legitimacy and of how it comes about and where it resides. **2649**

Agricultural Tenancy and Interlocked Factor Markets

Analysis of data on tenancy and interlinked transactions in Orissa in recent years shows that the marxist approach is more illuminating in studying interlinkage as it addresses the problem in the context of a differentiated class society. The autonomous role of class relations, however, must not be over-stressed. The macro variables that shape class relations and the enforcement devices of the dominant class need to be given due recognition. **2657**

Religion and Violence in the Dangs

The tribals of the Dangs region in Gujarat had been exploited by local elites and outsiders for over a century. When educated Dangi youth began to fight back, their first target was the corrupt Congress organisation. The issues were rights over natural resources, land titles, poverty and unemployment. Conversions to Christianity had led to minor skirmishes, but no worse. Hindutva organisations stepped in at this point, relegated the real issues to the background, sowed paranoia and reaped votes. **2667**

Political Budget Cycles

For a developing country such as India, political instability and frequent elections involve a heavy cost. In addition to the large visible cost of election campaigns and the expense of holding elections, there is a high hidden cost in the form of the efforts made by politicians to appease various lobbies at election time. An attempt to test the political budget cycle hypothesis in the Indian context by examining the behaviour pattern of macropolicy variables. **2676**

Kalpavriksh School

Kalpavriksh, which dates its formal origins to September 1979, provided early training in social commitment and has over the years made notable contributions to environmental education, documentation and activism. A 20th anniversary tribute. **2631**

Jat Assertion

The political waves created by the demand of the jats in Rajasthan for inclusion in the OBC category reflect the coming of age of the backward caste movement in the state. **2630**

Kargil and Kashmir

Kargil and Kashmir are inseparably linked and the alternative to a series of mature political engagements to regain the confidence of the people of Kashmir will be more Kargils, more killings and more betrayals. **2682**

Empty Empowerment

In the absence of devolution of financial powers from the state governments, the political empowerment of urban local bodies, as envisaged in the 74th Constitutional Amendment, remains devoid of content. **2637**

Scavenging Still

A national scheme to eliminate scavenging by putting in better sewage systems and rehabilitate scavengers has been in operation since 1991-92, but has achieved little so far. **2635**

Fair Elections

The hyper-active Election Commission has a vital role in ensuring that the elections are free and fair, but the success of what it proposes and implements depends on the commitment of the political parties and leaders to the democratic process. **2633**

Remembering V K R V Rao

His clear vision of economics as an integral part of the social sciences, concern as much as for the methods to achieve goals as for goal-setting and focus on people's welfare as the purpose of economic development were V K R V Rao's principal contributions. **2642**

Sexual Harassment

The manner in which the case of sexual harassment in the M S University has been handled by the concerned authorities underlines the need for a countrywide campaign for the adoption of the Supreme Court's guidelines. **2638**

LETTERS TO EDITOR

Sri Lanka's Indian Connections

THIS is with reference to Partha S Ghosh's article in *EPW* of June 19 on his impressions of a visit to Jaffna in Sri Lanka.

I wish Ghosh had a chance to investigate the sources of funds for the Liberation Tigers of Tamil Eelam (LTTE). I have heard about the drug traffic in Sri Lanka and LTTE's role in it. Secondly, I fear the present anti-south Indian (Tamil) attitude among Sinhalese and the consequent Tamil reactions have led to too much jealous rivalry to make any independent assessment of their ancestries worthwhile.

I was on a pilgrimage to Sri Lanka for seven days, June 3-10, 1999, in the company of some learned Sri Lankan monks and lay Buddhists. As we travelled by road from Colombo to Anuradhapura and Kandy, I was led to the impression that there was an alarming moral decline among Sinhala Buddhist youth. The discussion got focused on a front page article in a Sinhalese daily of June 6, 1999 about the steep rise in the consumption of narcotics in Sri Lanka in the last few years. As drug consumption among Sri Lankan Tamils (both Hindus and Muslims) was presumed to be negligible, it was concluded that most of the consumption was by the present generation of Sinhala Buddhists. My companions pointed their finger at the young Sinhala Buddhist driver of our vehicle who was not only indifferent to his religion but shockingly irreverent to the monks, playing aloud cassette tapes of voluptuous songs of love and sex. Whenever he dropped us at the temples or other historic sites, he used to return late, smelling of alcohol, perhaps enjoying drugs as well. I was distressed to hear from my companions that the smuggling of drugs was done by the LTTE for whom it was an important source of funds for purchasing arms. Drugs do more harm to a population than arms. I remember that on the occasion of the recent handover of Hongkong, the Chinese leaders were recalling tearfully the debilitating havoc that the British had done with opium.

History has so far been only speculative about the ancestry of the Sinhalese people. Like Ghosh, I too got the impression from them, both in Sri Lanka and in the US, that they are at times overzealous about their past links with north India. I think they use the expression north India rather loosely, not meaning Punjab or Rajasthan, but rather the north-eastern states like Bihar, Bengal and Orissa, because of their

associations with Lord Buddha, emperor Ashoka and his son Mahindra, whom they revere.

Again, one is not sure whether south India with its very close proximity has had no impact whatsoever on Sri Lanka. Kerala historians frequently refer to historical and cultural ties between Sri Lankans and Keralites. During my tour, I found coconut trees and coconut-based industries, as well as handloom and other industries as widespread throughout Sri Lanka as in Kerala. Coconut trees which were not indigenous to Kerala were originally brought from Sri Lanka. Like Sri Lanka, Kerala too had a Buddhist past, prior to the Aryan penetration from the north to the south around the 7th century A.D. Keralites at present are far outnumbered in Sri Lanka by Tamils, mainly because the erstwhile British colonists found it practical and economical to import labour from the former Madras province by the land-sea route connecting Dhanushkodi in India to Talaimannar in Jaffna, Sri Lanka. Today that route is closed, but there is now a booming air traffic between Colombo and Thiruvananthapuram and Colombo and Madras, carried by both Air Lanka and Indian Airlines. Thiruvananthapuram, the capital of Kerala, is only 45 minutes by air from Colombo.

In the last three or four years, large numbers of Ambedkarites in Kerala have embraced Buddhism. For meeting the spiritual needs of the Buddhists in Kerala, volunteer groups from neighbouring Sri Lanka seem keen to help, following a recent visit to Kerala by such a group.

Incidentally there is a Kerala Association in Colombo, whose vice president is a teacher of Malayalam to Sri Lankans. The Indian high commissioner in Colombo has frequently been a Keralite, including the present incumbent of that post.

P P LAKSHMAN

New York

Swaraj, Then and Now

THE point made by Mausumi Bhattacharya and Arup Kumar Sen to my article on 'Hind Swaraj' (*EPW*, June 12, 1999) regarding cultural nationalism as a response to globalisation is well made. In my understanding, the 'alienating homogeneity' as a consequence of globalisation, can lead to two kinds of response. Thus the response of reinforced 'cultural heterogeneity' can be either reactionary, as in the case of a cultural nationalism (as in India) and/or religious fundamentalism (as in Iran) that are ethnocentric and chauvinistic, or it can be an expression of a revolt against those at the centre of this process of globalisation, who promote and profit by it, by those at the margins who are disadvantaged by, and hence resist it. Such an opposition can have a positive and progressive content (as in Vietnam war and South Africa's rainbow coalition). Gandhi's swaraj too represented such a positive revolt, in stark opposition to the kind of negative swadeshi that is now being promoted by our present cultural nationalists.

Manufacturing Obsolescence

THE recently announced marketing agreement between Ranbaxy and the multinational giant Bayer marks a certain trend which has been evident for some time in the pharmaceutical sector all over the world. While the industry has certainly not languished, a number of factors in the last decade did force a slowing down of growth in the industry for the first time in the post-war years. The high cost of researching new products, the running out of the patent periods of many of the 'magic' drugs of the post-war decades and a growing awareness of drug risks and benefits among consumers, the greater stringency in the granting of new drug licences, newer and tighter controls on the import of drugs into third world countries – all of these contributed to the situation. This has led to some serious corporate shuffling in the sector with buyings, sellings, acquisitions and innovative new co-operative agreements. The Bayer-Ranbaxy deal represents one such trend.

Ranbaxy has agreed to sell the worldwide marketing and development rights for a novel drug delivery system (NDDS) or ciprofloxacin, one of the newer antibiotics, which it has developed and tested, to Bayer for what will amount to \$60 million. Bayer will have exclusive worldwide marketing rights except in India and the CIS, co-marketing and co-promoting it with Ranbaxy in some other countries. The new drug delivery system which is a product of Ranbaxy's research set-up took a few years to develop and is awaiting international patents. The new system will make it possible to deliver the drug to the system in just one dose a day instead of the currently available formulation which has to be taken twice a day. And this is a major breakthrough because it makes possible greater patient compliance. The deal is all the more profitable to both Bayer and Ranbaxy because the original patent on the drug held by Bayer expires in 2003, when anyone will be able to manufacture and market that drug. But now, with the new drug (which is what a novel drug delivery system amounts to) Ranbaxy and Bayer have positioned themselves to capture that market.

While this will certainly ensure that the profits keep flowing for the two companies, what does it mean for the consumers? With the patent expiring on the drug, more players would be in the market manufacturing the much-needed drug thus depressing the price of the formulation. If the drug were in the category of over-the-counter formulations such changes may not affect consumers as much. However, in the drug market, consumers rarely have a free choice, especially for prescription drugs. Moreover, in countries like India generic prescription is not the norm. This means it is not the consumer who

exercises her choice but the doctor who prescribes a branded product. With the well-established marketing methods and network which both these companies will be able to press into service for the sale of the new and more expensive drug, the older drug will get weeded out. This has been the fate of many older antibiotics which remain effective medically, but have been rendered obsolete by the marketing methods of pharmaceutical companies.

It is this manufacturing of obsolescence that is driving the pharmaceutical industry today. Ranbaxy, for instance, spends 4 to 5 per cent (projected to increase to 6 per cent) of its turnover on R and D and has filed patents for half a dozen more novel drug delivery systems (NDDS) in the areas of anti-infectives, cardiovascular drugs and antihistamines. It has also developed a new and advanced dosage form of the antibiotic cephalexin (which has a Rs 182 crore market) for which it has co-marketing arrangements with Glaxo. These two companies had a 55 per cent share of the cephalexin market which was being challenged by a new molecule, cephadroxin. For the consumer, of course, this can only mean a hike in prices. Among other developments in Ranbaxy is reportedly omeprazole, an anti-ulcerant with a \$3.7 billion market whose product patent with Astra expires in a few years. There are other firms too which have undertaken extensive bio-availability studies to come up with new molecules/NDDS here as well as in other countries. Bayer has recently signed an agreement, probably similar to the one with Ranbaxy, with Suntory of Japan for a 'new' antibiotic. An added advantage in the Indian market is ironically enough the government's various schemes for encouraging research in the pharmaceutical sector. New products developed in the R and D departments of Indian firms are offered a number of pricing concessions by which they can escape the price control basket such as it is.

It is not surprising then that pharmaceutical companies, including many in the 'Indian' sector, appear to be doing so well in India with share prices of leading companies showing a rising curve. One cannot, of course, cavil at the growth of the Indian pharmaceutical industry prompted by independent research and innovative marketing and production arrangements. It is also illogical to expect that the pharmaceutical sector, because it produces goods for the ill and is the one industry whose products are consumed by the rich and poor alike, should not be governed by the factors which move corporates everywhere, that is, profit and growth. Unfortunately, unlike for other products, the market here is a more or less a fictitious entity made up of those who have

little choice and can offer no resistance, despite the hard work of the consumer movement, to either price rise and or even quality unevenness. This being so, there have to be other mechanisms to ensure the availability of products necessary for the maintenance of the health of people. The dilemma that the Indian government faces today in its project of modernising the political economy is how to ensure this.

ARTICLE 356

Evading the Issue

IN his campaigns in Punjab and Andhra Pradesh, prime minister Vajpayee has been at pains to remind the people that the Congress had "misused the provisions of Article 356 and the authority of the president to pull down state governments". He asked the Congress to clarify the party's position on resort to Article 356 in future.

The choice of Punjab and Andhra Pradesh for raising the issue of misuse of Article 356 was deliberate, because these are the two states which have borne the brunt of such misuse in the past. Also it is the ruling Akali Party in Punjab which has been forcefully arguing for total abrogation of Article 356 from the Constitution. Even this time while the manifesto of the BJP-led National Democratic Alliance has chosen not to commit itself on the subject of whether or not the centre should continue to retain the power under Article 356 to dissolve a duly elected state government, the Akali manifesto has chosen to reiterate its long-held position with regard to this article, namely, that it needs to be altogether done away with. In Kerala, which was the first state to be subjected to the misuse of Article 356, the Left Front government has taken the position in practically all fora that not only should this provision in the Constitution be totally deleted but also that the post of governor should be abolished.

The BJP-led alliance commits itself only to "suitable steps to ensure harmonious centre-state relations in the light of the recommendations of the Sarkaria Commission...". It is noteworthy that the Sarkaria Commission did not recommend deletion of Article 356. What the Commission recommended was that the article should be resorted to "very sparingly, in extreme cases, as a measure of last resort, when all available alternatives fail to prevent or rectify a breakdown of the constitutional machinery in the state". More specifically, the commission recommended that a state legislature should not be dissolved before the proclamation under

the article has been laid before parliament and it has had an opportunity to consider it. The BJP-led alliance has not made its position clear on the subject, not even whether it fully subscribes to the position taken by Sarkaria Commission on how this particular provision of the Constitution has to be tightened to ensure that it is really resorted to only in extreme cases.

It is true, however, that the Congress Party manifesto which can otherwise not be accused of being short on words has chosen to be most economical when it comes to making any commitment on the subject of centre-state relations. While there is a vague reference to the party's belief "in a strong centre, strong states and in strong panchayats and nagarpalikas", everyone knows that in its 45 years of governance the Congress has demonstrated in abundance the extent of its commitment to federalism by its frequent use of the centre's powers to dissolve state governments and legislatures under the provisions of Article 356. It is therefore not surprising that in the party's manifesto all that is promised on the subject of centre-state relations is to "strengthen bodies like the National Development Council and the Inter-State Council and make their functioning business-like and purposive".

Even so, since the BJP-led alliance has chosen not to disclose its position on using the centre's powers to dissolve state governments and legislatures, it is obvious that prime minister Vajpayee was only trying to score a point against the Congress Party while canvassing in states where the public is still quite incensed on the subject, without bothering to make the alliance's own commitment clear on the subject. But will the voters be taken in by such tactics?

TAMIL NADU

From Region to Sub-Region

LIKE in the last two Lok Sabha elections of 1996 and 1998, the results of the present polls in Tamil Nadu are going to play a crucial, if not a determining, role in the formation of the government at the centre. The electoral battle in the state is being fought among three formidable fronts – the DMK-led National Democratic Alliance (NDA), the AIADMK-led Progressive Democratic Alliance (PDA), and the TMC-led Progressive Peoples' Alliance (PPA) – which has reduced the possibilities of a sharp swing in favour of any particular alliance, as happened in 1996 and 1998. Yet the dependence of the national parties, the Congress and the BJP,

on the DMK and the AIADMK to cobble up a workable majority at the centre remains undiminished.

The Congress, which claims to be averse to coalition politics, has entered into an alliance with Jayalalitha's AIADMK in Tamil Nadu. Ever since G K Moopanar left the Congress to launch the TMC in 1996, the Congress has been reduced to a nonentity in the state, a message that was driven home by Jayalalitha in her own cryptic manner when she absented herself from the joint rally in Villupuram addressed by Sonia Gandhi. On the other hand, the BJP which was a nonentity in the state till 1996, has gained acceptance and improved its vote percentage from 3 per cent in 1996 to 7 per cent in 1998 when it had an alliance with the AIADMK. In its new alliance with the DMK, which no doubt was facilitated by the resolution of the long-pending Cauvery dispute and the refusal of the BJP-led government at the centre to dismiss the Karunanidhi government, the BJP has been allotted one seat more than the five seats apportioned to it by the AIADMK-led front in 1998.

Interestingly, though the DMK-led front was the first to cement the alliance among its partners, it faced the maximum hurdles over seat distribution. Given that the PMK and the MDMK, two of the partners in the DMK-led front, have definite areas of influence in north and south Tamil Nadu respectively, seat distribution was bound to be a vexatious issue, especially after the PMK was generously allotted three additional seats in north Tamil Nadu while the MDMK was expected to remain content with the five seats it contested as part of the AIADMK-led alliance in 1998. The AIADMK-led front faced fewer hassles over seat distribution since, compared to the AIADMK, the other constituents of the front are dwarfs with small pockets of influence in the state. The seat distribution process within the three fronts reveals that sub-regional parties with near-total hold over geographically concentrated, specific castes or communities now have a larger say in the state. This is true of S Ramadoss's PMK which controls the 10-25 per cent vanniyaar vote in the northern constituencies, and of K Krishnaswamy's Puthiya Tamizhagam, a member of the TMC-led front, which enjoys similar clout among the pallardalits in the south. The AIADMK too has carved out a base amongst the thevars, kallars and agambudiyars – the three major OBC castes in south Tamil Nadu. In contrast, the support bases of the DMK, MDMK, the Congress and the TMC are diffused throughout the state among the advanced sections of the non-brahmin

castes, though the TMC is making attempts to cultivate a nadar base in the south while the BJP is involved in nurturing a Hindu constituency in the communally-sensitive areas of Coimbatore and Nagercoil.

As expected, the AIADMK has allotted most of the seats in the DMK-PMK bastion in north Tamil Nadu to its allies. Lately, in the wake of the police firing on agitating Manjoli tea estate workers led by Krishnaswamy in Tirunelveli, the TMC-led front has made a bid to consolidate dalit votes across the state. But given the combined strength of the PMK and the DMK in the OBC sections in the north, the weaning away of parayar dalit votes under the leadership of Thirumavalavan of the Dalit Panthers may not significantly alter the electoral outcome in the 18 constituencies in the north. It is in south Tamil Nadu that the DMK-led front is on a weak wicket. Except for MDMK's hold in certain regions, none of the alliance partners has a strong base there. With the nadars and dalits largely voting for the TMC-led front, and the Muslims and the Christians for the AIADMK-led alliance, which will have the additional support of OBCs in the region, the DMK-led front will be bereft of the support of any numerous significant community. In such circumstances, it may have to fall back upon whatever communal polarisation is generated by the presence of the BJP.

SPORT

The Best and the Worst

COMPETITIVE sport has been the focus of much ideological and philosophical debate over the last century. At various historical junctures fuelled by the capitalist ethic, the furtherance of the socialist dream and the bourgeois need for a healthy labour force, competitive sport is certainly in no danger of becoming defunct, as often used to be predicted. The idea that the element of competition need not be a part of sporting activity is today a ridiculous notion. Competition in sports is monitored by a host of sporting bodies which essentially contrive to offer that elusive 'level playing field'. Unfortunately so high are the stakes in competitive sport that these institutions have had to take on the garb and role of policing bodies. In sport after sport scandals of one kind or another have erupted and while they may have been resolved for the interim by stricter rules and rigorous monitoring mechanisms, the question that they pose is this: Is competitive sport facing an ethical and

philosophical crisis which may in its eventual resolution change the very nature of sport as we know it today?

In the last few weeks the track and field arena has seen some of the worst doping scandals ever. These have involved big names, including some who have always come out strongly against the use of performance enhancing drugs in sports. This in itself is not surprising, given the greater stringency in testing methods and the anti-doping campaign that the International Amateur Athletics Federation (IAAF) and the Olympic Committee have launched in recent years.

There can be no gainsaying that doping is not just a danger for a handful of athletes in a few sports, but is a real and serious risk for all athletes and for the future of athletics and sports. In recent years under the leadership of both the IAAF and the Olympic Committee, drug testing has become increasingly stringent and the list of banned drugs has lengthened. In fact, it may well be that the coming Sydney Olympics may see blood tests of athletes because it has been felt that they are more reliable than urine tests. Unfortunately, even as the tests have become more sophisticated and foolproof, the number of ways that drug offenders escape detection has also increased. Even worse, as the number of banned drugs on the list grows, the list has come to include substances which may have other uses and which athletes may consume unknowingly.

Early this year the president of the IAAF pointed out that the organisation had defended its jurisdiction and authority in enforcing some of the world's most severe anti-doping rules, having taken such defence all the way to the US Supreme Court and in Russia, France, Germany and Great Britain. All this he said was in the interest of creating a level playing field. And yet this level playing field is mythical and in the international arena some are more equal than others.

But even if we were to leave this irresolvable issue, there is need to ponder

over the crisis that is affecting all competitive sports. If the endeavour is to achieve physical perfection and to extend human limits beyond what was considered possible hitherto, then there will always be pressure to use aids of every kind. And if the aims and objectives of the international athletic movement are to ensure the health of the athlete and offer level playing fields, there are other issues which need equal consideration. While it may be unpalatable, it is a fact that the more rigorous training methods, some which actually harm athletes and limit their life-spans, too must come under scrutiny. All said and done it is only a small step from intense and severe training methods to consuming highly specialised diets to using supplements to enhance those qualities which would improve performance. It is here that international bodies must focus attention. Why, after all, is the use of performance enhancing drugs unethical, while the use of highly specialised diets and extreme training methods is not? And that is going to be a difficult issue.

Will this mean that fewer records will be shattered in future with better policing of the use of performance enhancing drugs? How great has been the fear of this was demonstrated by the accolades that poured in when US athlete Maurice Greene ran faster than any man had ever done over 60 metres, breaking the disallowed record of Ben Johnson who figured in one of the most devastating doping incidents in athletics. It is true that sports and particularly athletics produce intensely dramatic and near-superhuman triumphs – like the victory in every sense of the term of the gold and bronze winners in the 200m hurdles in the seventh world athletics championship in Spain, both of whom had battled with life-threatening disease only recently. But there is no escaping the fact that the arena which yields such shining examples of the human spirit is based on the ethics of intense and relentless competition which, more often, brings out the worst in the human spirit.

For the Attention of Subscribers and Subscription Agencies Outside India

It has come to our notice that a large number of subscriptions to the *EPW* from outside the country together with the subscription payments sent to supposed subscription agents in India have not been forwarded to us.

We wish to point out to subscribers and subscription agencies outside India that all foreign subscriptions, together with the appropriate remittances, must be forwarded to us and not to unauthorised third parties in India.

We take no responsibility whatsoever in respect of subscriptions not registered with us.

MANAGER

CURRENT STATISTICS

EPW Research Foundation

Despite signs of industrial recovery, India's export-import trade remains sluggish. Total imports in dollar terms rose by just 1 per cent in April-July and non-oil imports fell by 6.5 per cent. Exports showed a rise of 4 per cent rise, but with large month-to-month fluctuations.

LARSEN & TOUBRO

Restructuring Plans

ENGINEERING and cement conglomerate Larsen & Toubro (L&T) is the largest producer of cement in the country with a total capacity of 12 million tonnes per annum. The company has adopted a mix of expansion, acquisition and green-field capacity to boost its output over the years. However, high sunk costs as a result of this strategy have resulted in low margins not to mention increased interest burden due to the huge investments involved, and consequent low returns on net worth. The rise in the company's cement capacity has coincided with massive expansion of the domestic cement industry. Though cement accounts for less than a fourth of the company's turnover, it remains a significant factor as far as profitability is concerned.

The company faced a setback in 1998-99 when its net profit declined by 11.4 per cent over the previous year. Continued pressure on cement prices coupled with the higher depreciation and interest charges on account of the commissioning of cement plants in Gujarat and Andhra Pradesh affected the company's profitability adversely.

The company's engineering and projects business contributes around 60 per cent of its total turnover and it enjoys margins that are higher than average. Keeping in mind its core strengths, L&T has decided to take recourse to a restructuring plan for which it has appointed the US-based Boston Consulting Group (BCG) as advisors. The international consultants are expected to develop a comprehensive programme to steer the company to maximise shareholder value. BCG, which is to submit its recommendations by November this year, is expected to propose measures for value-creation through accelerated growth and enhanced profitability and also review the company's business portfolio and revalidate its strategies for becoming an Indian multinational.

If reports are to be believed, L&T plans to hive off its core businesses into separate companies. This move is expected to help the company leverage its strong fundamentals better in engineering, construction and cement.

Meanwhile, with cement prices firming up in recent times, the outlook for the company's cement business appears

encouraging. For the first quarter of the current year, the company's net profit touched Rs 208.5 crore as compared to Rs 289.3 crore in the corresponding period last year. Net sales improved by 34 per cent to Rs 2409.3 crore during the same period. The company's stock presently quotes at around Rs 352 on the bourses, discounting its 1998-99 earnings by 18.6 times.

HINDALCO

Right Decisions

One of the lowest cost producers of aluminium in the world, Hindalco has several strategic advantages which help it control the largest chunk of the Indian market for the metal. These include access to good quality and low cost bauxite reserves, captive power generation to meet most of its needs, alumina and smelting facilities, downstream production plants that span several products, and strategic joint venture companies that ensure uninterrupted supply of other key inputs such as caustic soda and aluminium fluoride.

The company performed well in 1998-99, notching up a 14.2 per cent increase in net profit on a 19.9 per cent rise in net sales. Though operating profit improved by 24.9 per cent over 1997-98, a sharp increase in depreciation (up 60.5 per cent due to the increase in fixed assets following completion of the capital investment programme) and interest (higher by 15.6 per cent) did curtail the rise in the company's bottomline to some extent. With earnings per share growing from Rs 66.6 to Rs 76.1, Hindalco raised dividend from 52.5 per cent last year to 65 per cent.

Keeping in mind that international prices of aluminium on the London Metal Exchange (LME) fell 18 per cent over the same period, the company's performance is quite encouraging. In fact, on an average, the company realised prices around three times higher than those in 1997-98, at a time when aluminium prices were at a five-year low.

One of the main factors responsible for Hindalco's improved performance was the fact that it completed its huge capital investment programme, carried out over the last four years, and these began to yield results during the year under review. Increased volumes with consequent cost advantages helped the company move against the industry tide. The technical

snag at Nalco's smelter, another major Indian aluminium producer, also provided Hindalco with an opportunity to increase domestic sales.

Another important strategy that the company has adopted is its foray into downstream products such as sheets, foils, extrusions and cans, and power transmission lines, which are the key to higher realisations. The significance of this move is evident from the fact that today though value added products make up no more than a seventh of the company's volumes, they account for half of its turnover annually.

Right decisions have helped the company build up its clout in the industry. Its decision to opt out of its proposed Rs 8,000 crore Aditya Alumina project in Orissa appears to be one such. With US-based consultants Kaiser Aluminium and Bechtel Inc having cast doubts over the viability of the project at its envisaged capacity of 2.5 million tonnes, Hindalco has decided to shelve the project as expected returns and shareholder value creation may not quite be commensurate with its large size and risks.

The company's stock presently quotes at around Rs 935 on the bourses, discounting its 1998-99 earnings by 12.3 times. The outlook for the company appears bright with aluminium prices having perked up at the LME during the current year. Though higher prices could lead to increased output all over the world, not to mention the off-loading of inventories built up over the past year, Hindalco should manage to hold its own against cheap imports because of its lower cost of production and other strategic strengths.

TATA CHEMICALS

Expansion Put on Hold

Initially manufacturing soda ash, Tata Chemicals later diversified into fertilisers and cement in the early 1990s when margins from its earlier product became stagnant. Today, while fertilisers (urea) contribute the largest chunk of its total revenue (up to 47 per cent), soda ash comes second bringing in another 39 per cent of total turnover. The balance is accounted for by products such as vacuum salt, sodium bicarbonate, cement, caustic soda and detergent.

The company's urea sales in 1998-99 were lower by 4.9 per cent over that in the previous year. Due to operational

NA. means not available.

problems, the company's fertiliser complex at Babrala produced only 8.78 lakh tonnes of urea as against 10.2 lakh tonnes produced in the previous year. The shutdown due to technical problems and the non-optimal operation also resulted in increased energy consumption, further adding to costs.

On the soda ash front as well, demand declined by 3.5 per cent during the year due to reduction in inventory by consumers and a lower growth in the detergent market. Exports too were adversely affected by the abundant availability of low cost soda ash from China both in south-east Asia and west Asia.

With urea coming under the Essential Commodities Act and its pricing dispatch and distribution being determined by the government, there is a high level of subsidisation of fertiliser for farmers, consequently leading to unremunerative margins for manufacturers. This has also led to Tata Chemicals putting on hold its Rs 1,200 crore investment plans for doubling the capacity of its urea plant at Bahrala in Uttar Pradesh to 1.5 million tonnes per annum. The current capacity of the Bahrala unit is 7,50,000 tonnes per annum and the expansion project envisaged a gestation period of over three years. The company has now decided to reroute the funds collected for this project to other ventures such as modernisation of its Mithapur soda ash plant.

A major development for the company has been the decision of the Income Tax Appellate Tribunal which allowed its full claim for deduction of Rs 86.42 crore paid as interest in the assessment year 1992-93. This ruling is expected to immensely benefit the company because it has a chain of claims of about Rs 350 crore on the same issue in the next couple of years. Reportedly, the company is expected to benefit by about Rs 200 crore when this ruling is given effect to.

The company's stock presently quotes at around Rs 74 on the Bombay Stock Exchange, discounting its 1998-99 earnings by 7.4 times. The company's strategy to diversify into urea in order to reduce fluctuations in its earnings from soda ash has not helped it much due to the fertiliser pricing system. The delay in determining the pricing policy of urea and the feedstock availability problems have already taken their toll of the company's performance. The company is now considering various investment options in the process industry. Though it is well positioned competitively, Tata Chemicals' future depends on government policy and possible future diversification.

RAJASTHAN

Backward Caste Movement Gains Ground

Nonica Datta

The continuing debate in the media over the status of jats in Rajasthan and Sonia Gandhi's decision to cancel her tour of the state are symptomatic of deep fissure in the Congress over the issue of including jats in the OBC category. Clearly, the backward caste movement has come of age in the state and political parties will need to accommodate their interests.

THE spectre of caste has increasingly come to haunt Indian politics. Caste, wrote the noted social anthropologist M N Srinivas, "is so tacitly and so completely accepted by all, including those most vocal in condemning that it is everywhere the unit of social action". Even though the role of caste is often decried as a fissiparous threat to national unity in some quarters, it is much more widely lauded as a channel of communication, representation, and leadership which links the mass electorate to the democratic political processes.

Caste as a factor in Indian politics is not new, though the resurgence of the OBC movement is of comparatively recent origin and can be traced to the process of Mandalisation initiated by V P Singh. With the backward caste movement gaining momentum throughout the country thereafter, the upwardly mobile jats in Rajasthan have also joined the race to secure access to the levers of power and patronage through reservations. The recent developments in this state, particularly on the eve of the forthcoming elections, is a pointer to the strength of the backward caste movement in Rajasthan.

The demand for reservations affects the upper caste Hindus more than any other segment of society. Hence, the organised opposition in Rajasthan, as indeed elsewhere, to the jat's demand for an OBC status. No wonder the Congress, having recovered the ground it had lost to the BJP, is sensitive to the upper caste backlash. But, in the process, it has alienated the jats, who had hitched their fortunes with the Congress in the recent assembly elections. The recently concluded All-India Jat Mahasabha in Jaipur, chaired by the former wrestler Dara Singh, has lashed out at the Congress for its 'betrayal'. The presence of Kanshi Ram, Ajit Singh and Tariq Anwar lent much political weight to what was

reportedly a massive gathering. The message emanating from the meeting was 'No quota, no vote'. "If khatris, charans, sunars and darzis are declared as backwards, why not us", stated Dharamvir, an IAS officer spearheading the present agitation.

Historians and political scientists have plotted the trajectory of jats in the plains of north-west India, comprising the states of Rajasthan, Haryana and western Uttar Pradesh. But much less is known about their counterparts in Rajasthan, whose origin and history, though documented during the colonial period, is still shrouded in mystery. Part of the reason for this neglect is that the jats in the region, once the stronghold of princely states and feudal barons, did not produce a high-profiled leadership either in the Mewar or the Marwar regions. Nobody acquired the stature of Chhotu Ram, who in the 1920s and 1930s, created among jat peasantry in Punjab an awareness of the importance of its collective strength.

Following the reorganisation of the states, the Rajasthan Jat Mahasabha, an offshoot of the All-India Jat Mahasabha founded in 1905, followed in the footsteps of Chhotu Ram. Local and regional jat leaders, some of whom allied themselves with the Congress, staked their claims through a well-organised campaign. They gained some advantages from their alliance, but the Congress, wary of alienating its upper caste constituency, has been reluctant to go far enough to fulfil their aspirations. The latest burst of anger against the Congress in not fulfilling its commitment to jats has been expressed by three Congress leaders, including a former union minister, who have recently defected to Sharad Pawar's Nationalist Congress Party.

Given their past and recent experiences, one can understand why the jats insist on

being included in the OBC list. Their chief grievance is that they have neither prospered during the long years of Congress rule nor found adequate representation in the bureaucratic or institutional structures. Though some amongst them have done well in the countryside, the rajput jagirdari elite continues to enjoy monopoly on land-ownership and the symbols and rituals of social deference. In some areas the rajputs exercise the right to decide on and enforce public rules.

In the 1920s and 1930s the Kisan Sabhas in Rajasthan organised large-scale agitations against the predominance of the upper castes: indeed their role was critical in mobilising important segments of rural society. The Arya Samaj movement, though based in Punjab, was also a catalyst of change and modernisation in Rajasthan. Prominent sadhus, including Swami Keshwanand and Karmanand, and religious bards toured jat villages preaching and singing of social reform, of the inequities of the existing order, and of the righteousness of the cause of social purification and change. They helped to foster a strong jat consciousness in a politically benign region.

Despite the pioneering role of the Arya Samaj, there is still strong resistance to any radical restructuring of the power equations. Balbir Singh, an elderly Delhi-based jat activist, insists that the social barriers, inherent in the caste hierarchy, have not been broken down. Many others like him want a share in the symbols of social dominance. I was told by a journalist from Nagaur, an important centre in Marwar and a citadel of jats, "that it is still uncommon for jats to ride elephants or any beast of burden before the hearths of prestigious rajputs". The point is well taken. The caste structures in Rajasthan are, to a large extent, intact. More importantly, the political and economic aspirations of the jats have not been fulfilled in a region where progress has been slow and tardy.

The strength of a community ('jati') lies in its representation in government and the profession. This is where the jats of Rajasthan feel left out. "Discrimination against us is rampant. This is the cause of our community's backwardness", observed Balbir Singh. Harendra Mirdha, son of the senior Congress leader Ram Niwas Mirdha, underlines the backwardness of jat peasantry in western Rajasthan. According to him, the creamy layer formula should be applied in the case

of reservations so that the facility benefits the most deserving.

It is difficult to foretell which way the wind is blowing: Sonia Gandhi's decision to cancel her tour of Rajasthan last month and the continuing debate in the media over the status of jats, is symptomatic of deep fissures in the Congress over the issue of including jats in the OBC category. But one thing is for sure. What is being echoed today on the streets of Jaipur and Jodhpur is nothing new. Long years ago, Chhotu Ram had made strenuous efforts to unite the jats of Punjab, western UP and Rajasthan: he even found in the sacred Pushkar lake a powerful symbol of jat unity. It was he who secured for them, though in a limited way, the status of a backward community. It was he who sensitised them to the importance of harnessing their energies to create a jat front.

Today, what is being demanded by the jats of Rajasthan may be seen as a serious

threat to the upper caste hegemony. But the fact is that the backward caste movements have come of age in Rajasthan, as indeed in other states. It would thus be foolhardy to disregard or take lightly their relentless quest for socio-economic empowerment and a greater share in the power structures.

In effect, political parties, having shed some of their past inhibitions and broadened their social base, will have to discover effective ways of accommodating the interests of the jats and other backward castes in Rajasthan and elsewhere. In the long run, this must surely be every party's agenda for the next millennium. Ashok Gehlot, the chief minister, should be able to read the writing on the wall if he wants to secure the support of the jats who can influence the result of 18 Lok Sabha seats in the September elections. How he deals with the rest of the OBC bloc, which is 26 per cent of the population, is a million dollar question.

Kalpavriksh School of Social Ecology

Ramachandra Guha

If the price for being a pioneer is that you don't get any credit then that is the price that Kalpavriksh would readily pay. A 20th anniversary tribute to the environmental organisation.

THERE is a price to be paid for being ahead of your time. In July-August 1983, a group of young students from Delhi University made a long, arduous journey on foot through the Narmada valley. They studied the landscape, spoke to villagers, interviewed government officials, and scanned through the available official documents on the largest development project planned in free India. After their return to Delhi the travellers wrote an extensive report on their findings, published, naturally, in the *Economic and Political Weekly*. The essay had a straightforward title: 'Narmada Valley Project: Development or Destruction?' (*EPW*, June 2-9, 1984).

The authors of this study came from a then-fledgling environmental group named Kalpavriksh. They were not professional writers, or professional social scientists. Yet there is a comprehensiveness to their analysis that, to my mind, has not been surpassed in the numerous books and essays since published on this most controversial project. In 13 closely — perhaps too closely — printed pages of the *EPW* were elaborated the ecological and cultural impact of the proposed dams on

the Narmada. The claims made by the state were subjected to close (and damaging) analysis. This was their conclusion:

Deforestation, soil erosion and impoverishment, siltation of reservoirs, pollution, land scarring, wildlife destruction, cultural disruption — all these seem to be inevitable impacts of the kinds of activities that the Narmada project in its present form envisages. In the long run, such environmental disruption is bound to reverse the temporary gains made by the project. Viewed from this angle, the project appears to us to be frighteningly suicidal in nature.

There is nothing of substance in Arundhati Roy's *The Greater Common Good* that had not already been stated in that article of June 1984. Kalpavriksh anticipated the novelist by 15 years. Indeed, they were there before Medha Patkar was. The *EPW* essay was, it appears, an important reason why Medha Patkar decided to shift from social work in Mumbai to social action in the Narmada 'ghati'.

If the price for being a pioneer is that you don't get any of the credit (when the world finally wakes up), then that is a price

that Kalpavriksh would readily pay. For it is an association with a remarkably undeveloped collective ego. The cause, rather than the celebration, has always been paramount. Of all the voluntary groups known to this writer, only the Peoples Union for Democratic Rights matches Kalpavriksh in its indifference to media attention or individual reward. (There is another way in which the two groups can be compared, to their mutual credit. This is the lack of sexism in their internal operations, the fact that in both the PUDR and Kalpavriksh women have played critical roles as actors and initiators.)

Kalpavriksh dates its formal origins to 19th September 1979, when the young girls and boys who were to be its founding members took part in a demonstration against tree felling on the Delhi Ridge. Regular meetings in schools commenced thereafter. Then, the next summer, a group of Kalpavriksh members went on a tour of Tehri Garhwal with the padayatri par excellence, Sundarlal Bahuguna. This, their first exposure to village India, was critical in bringing a social conscience to bear on an already developed environmental awareness. What they learnt in the Himalaya influenced their involvement in the campaign against the notorious Forest Bill of 1982. In the same year, Kalpavriksh also investigated and wrote about the deaths through police firing of villagers grazing cattle inside the Keoladeo Ghana National Park in Bharatpur.

I first made my acquaintance with Kalpavriksh in January 1983. I had just published an essay in this journal which questioned the faith among socialists that, especially in a poor country, environmental movements were but a 'bourgeois deviation'. While visiting Delhi I was contacted by three members of Kalpavriksh, and subjected to a searching examination. It was a singular experience, not least because the interviewers were much younger than myself. Two among the interview panel were still in school; one had just joined university. The interrogators wished to discover whether my *EPW* essay was the product of more than a passing academic fashion. I do not think I completely convinced them of my credibility. Since there could never be any question about theirs, I determined to pursue the relationship, regardless of any lingering doubts on their side. For some 16 years now I have been challenged and inspired by Kalpavriksh.

There are three areas of work in which Kalpavriksh has made notable contributions. The first is environmental

education. They have organised numerous lectures and exhibitions in the schools of Delhi, and have also published literature (based principally on their own work) for wider dissemination. I think especially of their documentation of the threats to little-known and fragile environments, such as the Andamans. These appear under their own imprint; in the wider world, meanwhile, two former members of Kalpavriksh, a husband and wife partnership, are among our foremost science journalists. Another person who spent her early activist years with Kalpavriksh is now a leading figure in a leading environmental NGO, and the author herself of influential essays on the politics of climate change.

Kalpavriksh has also built upon its early studies of large dams. When the Narmada Bachao Andolan got going in the late eighties, it was Kalpavriksh members who staffed and ran its Delhi Support Group. They helped link the Andolan with like-minded groups, and produced, and widely publicised, updated critiques of the project. For several years they circulated a fact-filled newsletter on dams. Individually, some of the teenagers I once knew have gone on to author impressive scholarly works on the politics and ecology of water use. One Kalpavriksh member published a fine sociological study of tribal participation in the Narmada Andolan; a second wrote a closely argued book on the political economy of water management in modern India. A third has just finished a doctoral thesis on the environmental and social implications of flood control.

Most members of Kalpavriksh came to the environment through an interest in wildlife. Bird and tiger watching produced, in this case, not a loathing for the human animal so easily perceived to be the 'enemy' but, rather, the desire to reconcile the sometimes conflicting aims of biodiversity conservation and social justice. The management of our forests and wildlife sanctuaries has continued to be of abiding interest. Bird counts have been organised in Sultanpur and Corbett; studies, set in other sanctuaries, conducted of the impact on biodiversity of commercial felling and mining.

An old faithful of Kalpavriksh has an unsurpassed knowledge of the status of our national parks. He has been in the forefront of the still evolving movement to make parks and sanctuaries more sensitive to the rights and claims of the human communities who live within or adjacent to them. His knowledge – leavened with his humanity – is embodied in dozens of essays and several books. A

honourable mention is also due to the Kalpavriksh member and erstwhile Narmada traveller who joined the Indian Forest Service to put his ideas and commitment into concrete practice.

The group now produces a regular *JPAM Update*, promoting the idea of 'Joint Protected Area Management', modelled on 'Joint Forest Management', whereby the state and local communities might come to work in creative partnership. But the academic study of forests and wilderness in India also owes an enormous debt to Kalpavriksh. I think of a young historian I know who has done important work on the history of wildlife conservation. Another historian is completing a book on the intellectual history of European forestry. A conservation biologist has published a well-documented analysis of pastoralists in Himachal Pradesh, knocking myths about the 'destructive' impact of grazing on biodiversity. An economist trained at the Delhi School of Economics, but oriented nonetheless towards fieldwork, published an essay in the *EPW* on Panchayat forests in Kumaun – this complemented by a more formal justification of common property resource management published subsequently in the flagship *American Economic Review*. The scholars who admire the work of these four lads do not generally know that, in each case, it might never have come to pass without Kalpavriksh.

Kalpavriksh provided an early training in social commitment for some who later moved out of the environmental field. Two of the stalwarts of the PU'DR, heroic and inspirational figures both, came to that organisation from Kalpavriksh. The youngest in the group that interviewed me back in 1983 moved into journalism; he now writes from that most difficult of outposts for an Indian reporter, Islamabad. (He earlier reported, outstandingly, from Colombo). I am told that the district magistrate of Latur in the post-earthquake rebuilding period was a Kalpavriksh man.

This listing is certainly incomplete, based as it is on one person's knowledge of the organisation. Other men and women from Kalpavriksh have gone on to become activists, social workers, and scholars. One, whom I did know, came from an aristocratic Delhi family, yet chose, with her doctor husband, to run a rural clinic and motivate peasants to protect forests in the Kumaun. It was in those forests that she died, tragically and before her time, working to the end in the spirit of quiet, unself-conscious service that Kalpavriksh has made its own.

Role of Election Commission in Ensuring Fair Polls

A K Roy

THE Election Commission can play a vital role in ensuring that the elections are fair and free, but the success of the measures it proposes and implements depends critically on the degree of commitment of political parties and leaders to the democratic process and the well-being of the people.

EVEN without Kargil and the monsoons this mid-term poll would have been a most crucial election for the country. Within four years the country is facing the third election. If this time also the election fails to give any party a clear majority and produces a hung parliament this may well become the last election under the present Constitution. Elections have become increasingly costly affairs and result in stalling all developmental activities. In Bihar the Lok Sabha election cost Rs 10.45 crore in 1952, Rs 9.5 crore in 1957, Rs 7.31 crore in 1962, Rs 10.96 crore in 1967, Rs 14.43 crore in 1971, Rs 29.81 crore in 1977, Rs 37.07 crore in 1980, Rs 78.28 crore in 1984 and Rs 110 crore in 1989 and in the country as a whole the amount would be several times higher. In the 11th Lok Sabha election (1996) Rs 542 crore was spent, in the 12th Lok Sabha election (1998) some Rs 750 crore, and in the present 13th Lok Sabha election (1999) the amount is likely to be more than Rs 1,000 crore. So in this election not only the fate of political parties but that of the Constitution and the country is at stake. This has put some additional and extraordinary responsibility on the Election Commission, political parties and, of course, on the people to make the polls fair, the results clear and the whole exercise healthy leading to a better tomorrow.

The role of the Election Commission is important. The main point is how to eliminate the domination of money and muscle power and put a check on the fanning of parochial feeling, derailing the process of election. Though the issue is connected with the broader question of social values and of the system itself, the Election Commission can have a catalytic role in the process. In the past the commission used to be considered a wing of the administration to complete the formalities of the election. Nobody even

knew the name of the Election Commissioner, or gave any importance to this institution or even took notice of its activities. However, after the coming of T. N. Seshan, there was a change. Till Seshan was in office he used to be the most talked-about person in any election, towering above all candidates, making his presence felt on all – the government, parties and the people. A model code of conduct was made to operate firmly and sometimes quite absurdly, showing the hitherto undiscovered and untapped power of the commission hidden in the Constitution. The way the election in Patna was declared null and void and officials shifted overnight over the head of the government made the administration shudder. Though after Seshan that initial momentum has slowed down, the trend continues and the office of the Election Commission and its wings in the states may not now be taken for granted.

Though Seshan's shock treatment is considered better than no treatment and often admired, experience shows that this does not solve the real problem. So the initial euphoria, the 'Seshan effect' started evaporating even during Seshan's time. One of the reasons was that the commission could not work as a super-government nor was it meant to bring about social reform. Sometimes it appeared that even the direction was wrong, defeating the basic objective. For example, the commission issued an ordinance last year to enhance the security deposit of candidates from Rs 500 to Rs 10,000, i.e., by 20 times, and increase the limit on expenditure from Rs 4.5 lakh to Rs 15 lakh. The reason given for the first was to discourage non-serious candidates who used to regard the election as a sport (there were 13,952 candidates in the 1996 election for 542 seats). But the treatment was worse than the disease and was definitely of no help in reducing the influence of money power.

On the contrary, it made elections even more the exclusive playground for moneyed people where the poor could not think of getting an entry. If the aim was to eliminate non-serious nominations, the number of proposers should have been increased such that before aspiring to contest the candidates and their parties would need to build organisations in the constituency instead of arranging for the enhanced security deposit.

Regarding the limit on expenditure, experience shows that for a candidate and a party with roots in society and feet on the ground, the amount Rs 4.5 lakh is not small since the campaigning time has been reduced to 20 days (i.e., Rs 22,500 per day, when the average per capita income per day of the people who are to vote is less than Rs 35 and half of them live below the poverty line). To curb money power in elections what is needed is not an increase in the legal limit on expenditure but a ban on donations from business houses and to make it compulsory for candidates not only to submit the actual account of expenditure in elections but also the source from which funds are collected. It is good that a major left party has refused to take a donation from a big business house. Real representatives of the people can go to parliament if parties learn to live on small subscriptions from people and the candidates are made to walk on the ground to find out the ground reality.

The recently published report of the Law Commission and the letter of the law minister also show how divorced is the thinking of the governing bodies and the law-makers from the real problems standing in the way of making elections fair and yielding results in the interest of the country. An absurd and totally irrelevant proposal in the name of avoiding instability of the government is to minimise the number of independents, whose number was only six in the last parliament by increasing the security deposits of the independent candidates to Rs 2 lakh. This means that only the rich people will have the opportunity to stand as independents. Moreover, political instability in the country has not been because of independents but the big parties in which principles have taken a back seat for long. The bigger the party the greater is its contribution to the instability. In the recently concluded conference of leading social workers and intellectuals on July 24-25 at Sewagram, Wardha, there was even an 'Appeal to the Nation': "The

people should reject those parties which have been in power at the centre and in the states and who have been responsible for the present wars in which the country finds itself."

The Election Commission should evolve some code and enforce it with or without the consent of the major parties to disqualify all those from contesting who change parties or enter parties after the dissolution of Lok Sabha, i.e., with an eye to get a ticket. Parliament is not meant for such self-seeking speculators. This means that the law of defection is to be made to operate not only when there is a parliament but also after it is dissolved.

State funding of the parties for elections is another proposal. Politicians and political parties squeeze the state exchequer enough after being elected and it would be ridiculous if they are to be funded for the elections as well. Instead of election campaigns being funded by the state there should be heavy taxation of every party's election expenditure.

What affects the results of elections the most is the increasing bogus voting. In the past this used to be at the most 5 to 10 per cent, but now it exceeds 50 per cent in some places in Bihar. Practically one-third to half of the votes are bogus. Previously there used to be long queues of voters with 50 to 55 per cent polling, but now there is hardly any queue and still polling is 70 per cent. Things have become worse with local toughs, the polling machinery and policemen participating in all this. So as part of its 'arrangements' for the elections, one party in Dhanbad collected the list of polling parties and their centres and reaped rich dividends the last time. People have become so disillusioned that many have started subscribing seriously to the naxalite view that elections are a farce. It is good that the Wardha conference suggested that "on the day of election, vigilance should be organised at polling booths by local volunteers with the permission of the Election Commission in order to ensure that the election is free and fair and is not vitiated by booth-capturing or other malpractices".

To combat this menace Seshan thought of photographs for voters, but for strange reasons the system which could have had some effect in the industrial urban belts with large floating votes was not put to use. However, even this would have had only partial effect as the main problem lies elsewhere. Now large-scale

rigging takes place not by impersonation but by a few persons stamping the ballot papers in full view of the polling authorities. This generally takes place at the end of the day or at the beginning when the voters are yet to exercise their franchise.

The best way of resolving this problem is to organise people's resistance, as the Wardha conference has suggested. But where that is not possible, another step is to examine on complaint the counterfoil on which each voter is to sign before voting and which is preserved. It is difficult to ascertain that those signing are indeed casting their vote, but if the signatures or thumb impressions are found to be of the same persons then the fraud can easily be detected and it concluded that the election has not been fair. Polling officers may not be able to detect impersonation, but they would definitely be able to notice bogus stamping and must report it after the poll, if it is not possible to do so during the poll process because of the lack of security. If the polling officers do not complain but aggrieved parties do and the complaint is later proved to be valid on examination of the counterfoils, then these officers must be brought to book for

conniving with the fraud and concealing the facts.

To curb the use of muscle power in elections, the local police and administration which generally connive in such acts must be shuffled. The day the campaign stops and until the end of the polls the entire administration should be put under the Election Commission and should function directly under the president. This would help eliminate many of the grievances of opposition parties about real or imaginary misuse of state power by ruling parties in elections.

There is talk of reviewing the Constitution and the election system and switching over to the proportional representation or list system. But with the ever-changing parties and a fractured polity, this will create more problems than it will solve. And India is not Germany. What is more, the fault is in us and not in the Constitution. Perhaps this was anticipated by B R Ambedkar when he said while replying to the debate on the Constitution on November 25, 1949: "I feel, however good a Constitution may be, it is sure to turn out bad, because those who are called to work it happen to be a bad lot".

CENTRE FOR SOCIAL STUDIES SURAT

Training Course on "Computer Applications in Social Sciences"

The Centre for Social Studies, Surat is organising an ICSSR sponsored course on **COMPUTER APPLICATIONS IN SOCIAL SCIENCES** from Oct 25 to Nov 3, 1999. The Course is meant for social science researchers who are engaged in survey research and need to deal with analysis and data processing. Knowledge of basic statistical method is essential. This course is designed to orient the participants to **fundamentals of computer, computer processing, foundation of data processing, quantification methods, statistical techniques and use of SPSS.**

Travel (to and fro second class), lodging and boarding will be provided free to the selected participants. Those selected will have to deposit Rs 500/- as earnest money which is refundable only after full attendance in the course. Participants will be charged a fee of Rs 800 in case of teachers; Rs 400 for PhD student with fellowship; Rs 200 for PhD student without fellowship.

For applications: **Course Director, Centre for Social Studies, University Campus, Udhna-Magdalla Road, SURAT- 395 007** latest by **October 8, 1999**. Phone: (0261) 227173, 227174, 226391. Telefax: (0261) 223851 E-mail: social@bom6.vsnl.net.in

Rehabilitation of Scavengers

Ramesh Chandra

A national scheme to eliminate scavenging by putting in better sewage systems and rehabilitating scavengers has been in operation since 1991-92. But it has achieved little so far.

RESTRICTING or forcing a person to any particular occupation on the basis of caste has been a great flaw of the Indian social system. Nelson's theoretical interpretation of the Indian caste system – genesis of social structure and basis of social order – seems obsolete in present times when society at large seems in no mood to accept this idea of structure thrust from above any more. More so, in the light of technological and scientific attainments, continuance of use of human labour to carry out tasks which involve the notion of filth is unacceptable. Scavenging is one such occupation, a blot on the Indian social system. People engaged in this occupation are, as a social group, called the 'bhangis', who were labelled as an exterior caste and polluted people throughout the country. This view was held even by Hutton, famous for his caste-based census enumerations of the country (1931), "it is not possible to say generally that such and such caste is exterior to Hindu society and to apply that dictum to the whole of India. *It may be possible to do so in the case of certain castes such as dom and bhangis.* A reflection that bhangi in background of its hereditary occupation is regarded as exterior everywhere in India and thus scavengers are lowly placed in social hierarchy in Indian society, is easily discernible" (italics added, Bindeshwar Pathak (1991): *Road to Freedom: A Sociological Study on Abolition of Scavenging in India*, Motilal Banarsidas Publishers, Delhi). It is rather unfortunate that although equal opportunity to all and right to a dignified life were incorporated in Indian Constitution, it is still not a reality 50 years later.

The low cost sanitation system, Sulabh International, developed by renowned action sociologist Bindeshwar Pathak, is important for the liberation of scavengers. 'sulabh shauchalaya' serving as a public utility and conversion of dry latrines into water borne (based on pit system of wet sanitation) would help improve sanitation and liberate scavengers from their traditional occupation. Planners and social policy-makers formulated a national scheme of liberation and rehabilitation of scavengers and their dependents with a view to eliminating the practice of scavenging altogether.

This national scheme of eliminating scavenging and disposal of 'night soil' on

human heads was initiated in 1991-92, but became effective during the eighth plan period when the ministry of welfare initiated a scheme for abolishing night-soil disposal on human heads.

"The process of liberation of scavengers involves not only value conflict, rehabilitation and change in the means of livelihood; it is also closely related to the change in social status and patterns of social relationship" [Pathak 1996: 14]. While this aspect of liberation depends on social and cultural constraints, one thing which can be done immediately is stopping the use of traditional dry latrines altogether. It is heartening to note that the scheme of liberating scavengers through low cost sanitation has been introduced in different parts of the country. Bihar introduced the scheme not only in cities like Patna and Ranchi but also in smaller towns like Purnea, Medhuhani and Arrah besides some industrial towns like Dhanbad and Jamshedpur [Pathak 1996: 19]. However, Delhi illustrates how a scheme began with good intentions can become skewed and non-operational.

The national scheme of liberation and rehabilitation of scavengers has been envisaged with two integral components with a view to eliminate the practice of scavenging. One is to restructure the mechanism of disposing night soils by introducing water borne latrines and the other is to rehabilitate the scavengers in some other occupation by providing adequate training.

The work of conversion of dry latrines into water borne is a prerequisite to stop the practice of scavenging. Dry latrines are found in towns and rural areas all over India. Responsibility for conversion of dry latrines lies upon agencies such as municipal corporations and other local government organisations. At national level the responsibility of such conversion of dry latrines into water borne ones is with the ministry of urban development.

The rehabilitation of scavengers thus freed from the traditional work of disposing night soil as headloads, is the responsibility of the ministry of welfare. This is the 'soft-core' work of the entire scheme of liberation and rehabilitation. To meet this objective the scheme evolved three dimensions in its implementation. One, a time-bound programme of identification of scavengers and their dependents at the

national level in different states/union territories and up to the level of village. Two, a survey of aptitudes of scavengers for alternative jobs or trades and a comprehensive training programme for identified trade or job. Necessary training of a duration of one to six months would be arranged in local training centres of different departments of state/central government. Besides, NGOs and such other organisations, which have some expertise in the respective subject of training, are to be involved in the programme. Three, the financial component for rehabilitating scavengers in different trades or jobs by providing adequate loan or subsidy and margin money, etc. through banks and direct central assistance.

Further, an expenditure of Rs 5,000 per month and a stipend of Rs 150 each for identified liberated scavengers and their dependents was envisaged. For their rehabilitation a sum of Rs 50,000 has been fixed as financial assistance to the project for each beneficiary. It includes 50 per cent of subsidy subject to a ceiling of Rs 10,000 of capital cost, margin money loan of 15 per cent of the project cost at a nominal interest rate of 4 per cent. Remaining portion of fund requirement is to come from commercial banks who are under advice of Reserve Bank of India to entertain such proposals. However, the entire amount of subsidy on training is to come from the central government while the outlay on margin money is to be shared by respective state and the central government in the ratio of 49:51.

Ever since the inception of the scheme of liberation and rehabilitation of scavengers in 1991-92 with total fund of Rs 50.50 crore as central assistance, there has been an upward increase steadily in fund allocation. During the eighth plan period, 1992-97, Rs 464 crore was set aside for this problem. A look at the yearwise financial involvement and performance of 'training and rehabilitation' programme helps us to assess the performance of the scheme at the national level (Table 1).

TABLE 1: FUNDS AND ACCOMPLISHMENTS OF SCHEME

Year	Funds Released to State Government (Rs Crore)	Number of Scavengers	
		Trained	Rehabilitated
1991-92	50.50	-	-
1992-93	60.73	16288	19007
1993-94	70.97	13266	40820
1994-95	73.00	24568	63746
1995-96	90.00	50000*	100000*
Total		104122	223573

Note: * Proposed by state governments.

Source: Annual Report, Ministry Welfare, New Delhi, 1995-96.

The survey for identification of scavengers was carried out in 13 states and union territories – Andhra Pradesh, Assam, Haryana, Himachal Pradesh, Jammu and Kashmir, Kerala, Madhya Pradesh, Orissa, Punjab, Rajasthan, Tamil Nadu, Delhi and Pondicherry. The survey identified 7.36 lakh people (Ministry of Welfare, Annual Report 95-96). Statewise survey statistics are given in Table 2.

In western states of Gujarat, Rajasthan and Maharashtra work of rehabilitation has been slow or negligent. In none of these states has the training component covered more than 3.15 per cent of the identified scavengers; and in rehabilitation accomplishment is about 11.00 per cent in Maharashtra. In Delhi, where the abolition of scavenging was announced by the prime minister from the rampart of Lal Quila, out of 17,420 identified scavengers only 153 were offered training in alternative vocations and 701 were

rehabilitated by 1994-95. Situation at the national level is far from satisfactory. Of the total number of identified scavengers (7,36,114) only 13.29 per cent could be trained and 25.74 per cent were rehabilitated until 1995-96 (Table 3).

It is disheartening to observe the dismal performance of the scheme so vital to social upliftment of the downtrodden and neglected people. This in spite of the fact that a simple technological solution has been available since the 1960s. The constraints are of two kinds 'hard core' – conversion of dry latrines into wet water borne ones, and softcore – training and rehabilitation programme.

Conversion of dry latrines is a subject under the charge of department of urban development. Bearing expenses on account of dry latrines poses a problem. Under the general policy, the government can bear cost only in case of those belonging to weaker sections of the society who are below the poverty line. This allows limited scope for conversion work. Dry latrines exist in small and medium class towns of varying community and income group composition. Even in municipal towns of bigger sizes or class there are dry latrines. In Delhi, a proposal to bear expenses of conversion of dry latrines irrespective of economic status of residents was rejected because the better-off residents would also benefit. Unless some stringent law is enforced to do away with the practice of disposal of nightsoil manually by compelling the residents to incur such necessary expenses on conversion works this practice will not end. However, funds do play a deterrent role in this major task. The problem can be solved only if the civil residents themselves come forward on their own to go for conversion work at their expenses.

Constraints were observed in the soft-core sector of training and rehabilitation as envisaged by implementing agency.

The rate of stipend, Rs 150 per month, for each trainee is much lower than the average income earned by scavenging. There is a proposal to enhance the stipend from Rs 150 to Rs 750 per month.

Although loans are to be granted to individual target beneficiary as per norms laid under the scheme with arrangements with the Reserve Bank of India, subsidiary banks have shown reluctance in sanctioning loans to those found defaulters on account of other developmental schemes, and to more than one individual of the same family. These banks refuse to sanction loan on technical grounds, non-feasibility of projects and in default cases for want of assured repayment of the loans.

Inadequate infrastructural support and contribution at grass roots level is yet another impediment to the scheme. In fact

different state departments are supposed to cater to the need for providing training to identified persons. The training gets weakened firstly by poor enrolment of persons due to lack of initiative and sufficient stipend amount; and then, by poor co-ordination and inadequate facilities.

As regards the rehabilitation programme, project formulation has not seen beyond the traditional avenues of piggery, poultry and the like which turn to be non-viable. There is a need to evolve projects on the basis of current demand for goods and services.

Considering the poor performance, there have been a number of attempts to expand the scope of scheme qualitatively. One such attempt is to reformulate the training modules so as to incorporate TRYSEM norm of training conducted in the rural development sector. Diverting the channel of central assistance through the state scheduled caste development corporation (SCDC) directly through its nodal central agency, the National Scheduled Caste and Scheduled Tribes Finance and Development Corporation is another major breakthrough.

The focus is being shifted from individual beneficiary to his/her family unit so as to widen the scope of group projects to be taken up for rehabilitation. Yet another significant step has been the setting up of National Commission for Safai Karmacharis in 1994. This commission is to recommend specific programmes for elimination of inequalities between states. To provide education to the children of scavengers and others in unclean occupations, under a scheme in operation since 1977, financial assistance such as scholarships, is provided. The central government bears 50 per cent of the expense (Rs 1.98 crore at the end of the sixth plan period). Besides, an ad hoc grant of Rs 500 per month to all eligible children and scholarship is given for 10 months in a year to both hostelites and day scholars.

No matter how well-formulated a national policy is, success depends upon commitment, implementation and the response of the target groups, their ethno-centricism, population size, socio-cultural characteristics and will to accept change. Merely pumping in funds cannot help solve the problem. There must be a two-way reciprocal arrangement between the policy-makers and the beneficiaries. Much can be achieved with limited funds if the size of target group is contained and alternative avenues are explored.

[This is a revised version of 'Rehabilitation of Scavengers: Some Policy Perspectives' presented at a seminar held at the Centre for Social Studies, Surat, in 1997. The views are of the author and not of the organisations with which he is or has been associated.]

Myth of Empowering Urban Local Bodies

Soumen Bagchi

In absence of devolution of financial powers from the state government, the political empowerment of the urban local bodies, as envisaged by the 74th constitutional amendment, fails to make much sense.

It is a common belief among the scholars, policy-makers and many others involved in the sphere of urban problems and issues that the Constitution (seventy-fourth) Amendment Act, 1992, has been a breakthrough in the history of urban local governance in India. Apparently it may seem that the 74th Amendment, 1992, has made a dent in the urban governance in India in comparison to the status enjoyed by the urban local bodies (ULBs) prior to it. It is to be noted that the local administration was a state subject according to article 12, schedule 5, list II of the Constitution. Article 268 and article 269 of the Constitution of India specify the duties that are to be levied by the government of India but will be collected by the state governments. It also clearly mentions those duties and taxes that will be levied and collected by the government of India but are to be assigned to the states. No such provision was kept for the urban local bodies in India. The 74th amendment, 1992, was in reality reluctant enough to keep such provisions. Article 243X of the Constitution of India does not specify the duties, tolls and taxes to be levied and collected by the municipalities and those to be collected by the state and assigned to the local bodies. The ultimate decision of authorising and assigning selective taxes to the local bodies continues to reside with the state legislature. However, the formation of the state finance commissions (SFC) has been a significant move in this direction. Article 243Y empowers the SFCs to make governing principles regarding (a) the distribution between the state and the municipalities of the net proceeds of taxes, duties and tolls leviable by the states, (b) the determination of taxes, duties, tolls and fees which may be assigned to or appropriated by the municipalities, and (c) the grants-in-aid to the municipalities from the consolidated fund of the state. Thus, it can be seen that the 74th amendment, 1992, has more or less succeeded in keeping the financial powers of the local bodies within the jurisdiction of the state governments. Similar is the case so far as the devolution of functions and responsibilities to the local bodies is

concerned. Article 243W (XIIth schedule) of the 74th amendment, 1992, consists of a long list of obligatory functions for the ULBs. However, what functions and responsibilities should actually be assigned to the municipalities in place of or in addition to what they already have is still left to the state legislatures. Thus, if the provisions in the 74th amendment, 1992 are analysed critically, the amendment seems to have succeeded only in providing a long list of functions and responsibilities to the local bodies without doing much in empowering them with the financial powers. It seems at the moment that the 74th amendment, 1992, itself needs certain amendments for it to be more specific in its objectives. Empowering the ULBs should not remain limited to political empowerment as it does not make much sense without financial empowerment.

In fact, shortage of resources is a major problem faced by the ULBs in India. On the one hand, the local bodies have few buoyant taxes at their disposal, and on the other, even these taxes undergo certain unscientific method of computation, as in the case of property tax, or suffer from inefficient collection because of unwarranted political intervention. The empowerment of the ULBs has more or less remained a matter of discussion for scholars and researchers. So far as the financial condition of the ULBs in India is concerned, it is largely dependent on state government's transfers either through various grants or assigned revenues. The financial situation of the ULBs further deteriorated except for Gujarat and Maharashtra with the abolition of octroi and without providing an appropriate alternative for the same. Octroi is supposed to be the only source of revenue based on the level of economic activity of the city and had the required growth potential according to the increasing resource requirement of the ULBs. Often the abolition of octroi is justified on the ground that its method of collection led to enormous wastage of time and energy. So, the best way to improve the situation, it was thought, was to do away with it rather than attempt a more scientific and time-saving mode of

its collection. This drastic step satisfied the affluent few but in the long run handicapped the ULBs already in a financial mess. Thus, on the one hand, the objective is to empower the ULBs to make them go to the capital market and private partners for lumpy capital investments, and on the other, make them more dependent on the state government grants by abolishing the most buoyant revenue source which could have been used for various other purposes including debt-servicing. In the states where octroi has been abolished, it is being compensated by an octroi compensatory grant from the respective state governments. The situation is however far from satisfactory. While the octroi accounted for nearly 60-70 percent of the total revenue and grew over time with the growth in economic activity of the city, the grants, besides being a fixed amount, account for a mere 15-20 per cent of the ULBs' total revenue. Thus, it has been often observed, the policies adopted by the government become self-defeating.

The state government is no more in a position to continue subsidisation of the civic amenities and has to look for unconventional method of financing urban basic services through funds from the capital market or public-private partnership. Nevertheless, the success of such experiment will depend to a large extent on the financial self-sufficiency of the ULBs. Hence, the government will either have to reinstate octroi or will have to allocate an appropriate alternative for the city level government, provided the alternative source grows with the growth in city's economic activity and of course, does not have to face the similar hazards in its collection as was the case with octroi.

Dealing with Sexual Harassment at Workplace

Impasse Continues

Bina Srinivasan

The manner in which the case of sexual harassment in the MS University has been handled by the concerned authorities points to the need for a countrywide campaign for the adoption of the Supreme Court guidelines.

THE MS University campus has been fraught with tension over the issue of sexual harassment since March 1999. As has been extensively reported, it was the complaint of a PhD student that triggered off the furore. In response to the student's complaint of sexual harassment by her guide, the vice-chancellor instituted an inquiry committee to go into the issue which, to put it mildly, gave the lecturer a clean chit. The MSU syndicate lost no time in unanimously accepting the report without a murmur of protest at the language or the obvious biases of the inquiry committee report.

Close on the heels of the inquiry committee report came the report of the Guidelines Committee which presented the syndicate with recommendations to set up a redressal mechanism to deal with sexual harassment on the campus. On August 2, 1999 the syndicate unanimously rejected this report. The syndicate contends that the recommendations are one-sided. A new committee has now been set up to 'look into the recommendations', and amend them suitably. The genesis of the rejected report can be traced to the Supreme Court judgment on sexual harassment at the workplace which was delivered in August 1997. The then vice-chancellor, Padma Ramchandran set up a Guidelines Committee to go into the means by which a redressal mechanism could be instituted in the MSU primarily as a preventive measure. The Guidelines Committee also had a mandate from the syndicate. The Supreme Court judgment legitimised and endorsed the concerns expressed by women within the university and other women's groups. Indeed, the SC judgment gave an impetus to women's groups in campuses all across the country. Many consultations and discussions have been held since then. As a result, many groups have come up with drafts for policies that could be instituted by educational institutions. Following the UGC directives to all universities, the efforts of

women's and students groups have been further underscored.

At MSU, the Guidelines Committee looked up various draft policies, legal provisions, the SC judgment and formulated a set of recommendations. Some of these are: – A permanent cell called the Sexual Harassment Prevention and Redressal Cell should be constituted with seven members on board, half of whom should be women. The cell should also be chaired by a woman and include representatives from the Baroda University Teachers' Association (BUTA), the syndicate, an academic member, Women's Studies Research Centre, an NGO working on women's issues and a PhD student.

– A constituting committee should be entrusted with the selection of members of the cell.

– The functions of the cell should include dealing with complaints of sexual harassment, and creating a gender friendly environment.

– The cell should adhere to the Supreme Court definition of sexual harassment.

The Guidelines Committee report has two dissenting notes. The first one asks for punitive measures for the complaint, "in the same manner as it would have been imposed on the accused if found guilty", if, "the inquiry committee comes to the conclusion that the complaint is baseless and it is made by the complainant with the mala fide intention of harming the reputation of the accused". The second dissent note says that, "the accused must be suspended from his duties immediately", once a complaint has been registered.

As is evident, the Guidelines Committee has taken care to include representatives of all the parties that would be affected by complaints of sexual harassment within the university, i.e. students, teachers and women. NGO members have been included to safeguard against internal pressure. The arbitrary dismissal of such recommendations seems to indicate a mis-

placed fear on the part of the syndicate. When seen in conjunction with the syndicate's acceptance of a report that has made short shrift of a complaint of sexual harassment against a lecturer it seems ominous. In addition, the recommendations adhere so completely to the Supreme Court guidelines that it is surprising, to say the least, that the syndicate has reacted in this knee-jerk and short-sighted fashion.

Here a comment on the first dissent note is necessary. A cell set up to look into sexual harassment cannot begin with a stipulation that 'false complaints' need to be punished. Such a stipulation overlooks the situation on the ground. Central to the issue of sexual harassment at the workplace is the misuse of power and the silence that usually surrounds it. Sexual harassment is an expression of domination in the crudest sense as it inhibits women from functioning without fear of violation of their sexual dignity. A cell to go into cases of sexual harassment is geared to cater to the needs of women who are vulnerable to misuse of power. If creating a women-friendly environment is the basic issue, then introducing a punitive clause is self-defeating. Instead of preventing sexual harassment it will prevent complaints against such acts.

The way the syndicate has chosen to react to both the reports reveals a deep-rooted resistance to making fundamental structural changes. This opposition seems to hinge on two factors, (i) the fear of taking an unambiguous pro-women stance, and (ii) the reluctance to allow for mechanisms that would break the silence around sexual harassment. The silence imposed on women in this context is linked to a morality that sanctions the supposedly 'predatory' nature of male sexuality. The two polarities at play here are male privilege and female assertion. Since one cancels out the other there is a clear oppositional dynamic. When institutions decide to disfavour female assertion, they take sides with male privilege. Any mechanisms that seeks to break the silence overturns the balance of forces. By that standard a perspective that allows for any move towards such an overturning can indeed be called biased. However, the objective reality is that women, even in positions of power, are often vulnerable to a morality that glorifies submission and celebrates domination. The SC guidelines are a breakthrough in that they represent an attempt by the state to articulate a women-centred point of view in terms that unequivocally favour gender-justice.

It is true that merely constituting a cell as recommended above will not solve all

problems. All such bodies would be subject to various kinds of influences. However, the importance of the existence of such a cell is that it would act as a deterrent to acts of sexual harassment. This is precisely what the SC guidelines hope to initiate when they refer to preventive measures. That, however, is the second step yet. In MSU, as is perhaps the case elsewhere, even the first step, i.e., the need for a cell has met with such resistance that we seem to be decades away from any effective implementation of the SC guidelines. At this juncture, the struggle it seems, is about the acceptance of the SC mandate. Implementation and devising ways in which they can be complemented with tamper-proof measures will be a protracted and perhaps, acrimonious affair if educational institutions refuse to re-examine some of their inherent proclivities towards preserving the male dominated status quo.

Despite the wide publicity given to the SC judgment it seems that the authorities in MSU have failed to realise that not taking active steps to amend their statutes in accordance with the judgment, is tantamount to contempt of court. At the National Consultation on Sexual Harassment on University Campuses organised by Indian Association of Women's Studies and the Human Rights Programme of the University of Hyderabad in January 1999, most groups reiterated the many frustrations of working with similar attitudes. In rejecting the recommendations as biased, the MSU syndicate endorses its belief in the submission of women to structures of power governed by a male-dominated ethos. The new committee refuses to allow for participation of women's groups both inside the university or outside. This surely reveals what could be called anti-women prejudices on the part of the syndicate. A bias in favour of vulnerable sections is an acknowledgment of the disadvantages caused to vulnerable sections of society by structural biases and displays a will to rectify that. However, a disposition in favour of existing power structures that are predicated on the subordination of these vulnerable sections negates the very basis of justice. Indeed it calls into question the very objectives of setting up any mechanism that ostensibly speaks for these sections. So while we do have a committee in place at the MSU, it remains to be seen as to what mantle it will don.

As none of these developments have occurred in a vacuum, it is even more clear now that given this environment, if the SC guidelines have to be implemented, the struggle would have to be across univer-

sities, across all workplaces. As it were, battlelines have been drawn in a war that seeks to decide if sexual harassment on campus is an issue that merits any serious concern. In a context vitiated by Machia-

vellian tactics, women in MSU may find themselves bereft of even the minimum support the system can offer in terms of safeguarding their interests on the campus.

Russia: Twilight of Yeltsin Years

P L Dash

Yeltsin's last year as president is the most intensely political year for Russia. Yeltsin needs a man he can trust as the new president considering his shady links with Russia's oligarchs and the Russian mafia. But there is a real challenge posed by Moscow mayor Luzhkov and ousted prime minister Primakov. The economy and the common people continue to suffer while politicians play politics.

IN the autumn of 1991, expectations were high in Russia. The unsuccessful *coup d'etat* of August 19 had finally revealed to the public the incapacity of Mikhail Gorbachev to bridle his regime. His reinstatement in power within two days of the coup never revived the aura of his political prowess for the rest of his tenure. For Russia, Gorbachev was gone and the political hero was Boris Yeltsin, a populist maverick catapulted to prominence by the 'velvet revolution'. His demagoguery had buried forever the essence of glasnost under the debris of a crumbling Soviet Union. Within just four months, the Soviet Union was no more. In retrospect, it seems Russia's real agony had just begun.

The period since August 1991 in Russia has remained as tumultuous as the country's bumpy path to capitalism. Native prescriptions for quick capitalism have landed the country in chaos. An established system was thoroughly dismantled in favour of a system that has never fully taken root. The shenanigans of unsuccessful reforms have more horrifying tales to tell than just explain the inability of political leadership. The failures are reflected in the everyday misery of Russia's people.

In the book *Genocide* published in Russian in 1997, Sergei Glazyev states that from 1992, a consistent tendency of depopulation is discernible in Russia: the death figures are 1.5 times higher than birth. The per woman birth rate is just 1.3 children – lowest of all European countries. At the same time, 15 deaths are registered per 1,000 population – the highest in entire Europe. This tendency, if continued, suggests that by 2005, there will be a 6 per cent or 9 million decline in Russian population. Longevity is declining, currently at 57.5 years for men

and 70.4 years for women. Infant mortality is rising.

The post-Soviet economic difficulties have negatively affected the Russian reproductive behaviour. Lack of employment opportunity, less pay and often no job along with all attendant difficulties of transition from socialism to capitalism have largely discouraged the population to procreate. Seventy million people or half of Russia's total population are on the brink of or below the poverty line. Compared to 1990, the level of poverty in Russia was up 15 times in 1997; and after the August 1998 economic crisis, it has soared higher driving nearly 70 per cent of the population to the brink of subsistence.

A couple of years back, when Anatoly Chubais obtained the ouster of the then Central Bank chief Victor Gerashchenko, easy credit flow suddenly ceased. Inflation was attacked through monetary starvation and debts and wage arrears piled up. Much of the economy shifted to the rails of barter, and when that failed to yield results, a large part of the population of Russia was reduced to hand-to-mouth existence. This was the cumulative result of years of experiments with dismantling the Soviet economy. This was indeed the real shock therapy for the Russians. After eight years of reforms, less than one-third of the Russians expect to have enough financial resources to consider buying a house; and only one-sixth think they could borrow a few weeks' wages from a bank. In contrast, as noted by Robert V Daniels, "capital accumulated from speculation or from natural resource exports was squirrelled away in Swiss bank accounts and London real estate to the tune of perhaps \$ 100 billion a year". It is clear that when people suffered, racketeers profited.

Employment in Russia has decreased 14 per cent, from 75 million in 1990 to 64 million in September 1998 and GDP has fallen during the same period by more than 40 per cent. The minimum monthly wage is currently 83 rubles or just around \$ 4. Some 15 per cent of the Russian population in 1996 was made up of people who were 'very poor'. While only 3 per cent of the poor live in metropolitan cities like Moscow and St Petersburg, poverty has become a chronic phenomenon in rural Russia where it is estimated to be 43-44 per cent. With low education, inadequate occupational skill and lack of access to landed property, the 'very poor', obviously unemployed, remain invariably the worst sufferers.

While this lowest decile of the population is the cause of concern, in spring 1998, three in five Russians were not getting the wage or pension they were entitled to. This trend has increased ever since. Russia's per capital GDP in 1998 fell by 4.6 per cent and is expected to drop further by 3-4 per cent in 1999. Amidst this gloomy picture of a country that was once a superpower, Russia is drafting a budget for 2000, which is just \$ 24 billion or half the budget of Texas. In 2000 Russia is going to spend 42 per cent of the budget in debt servicing. It targets an economic growth rate of just 1.5 per cent with 18 per cent inflation. These figures are unlikely to take Yeltsin's countrymen to a luxurious millennium.

In the past eight years of Yeltsin's rule analysts encounter the ebbs and tides of incredible negation. Prime ministers appear and disappear, but the country's president goes on to throw surprising reshuffles of his political cards. Aligning with the forces of foreign capital controlled by the native neo-rich called oligarchs, ailing Yeltsin is the typical symbol of Russian decadence. Russia's cadence of sorrow is really the decadence of its leadership. His promises of a prosperous Russia have proved empty promises, and people doubt that they would ever be fulfilled.

In the past 17 months, Yeltsin has changed five prime ministers. First, Victor Chernomyrdin was replaced by Sergei Kiriyenko in March 1998. Kiriyenko lasted five months and was thrown out in August 1998. Yeltsin's efforts to reappoint Chernomyrdin at that time met with the Duma's stoic opposition. Yevgeny Primakov, who rose as a compromise candidate endorsed by all was unexpectedly out by May 1999. His failure to minimise economic problems and handle the Kosovo crisis to the linking of the west

earned him the displeasure of Yeltsin. His place was then taken by Sergei Stepashin, who continued in office for a mere 82 days up to August 9, 1999. From that day, a little-known Vladimir Putin, who was once a close associate of the discredited St Petersburg mayor, Anatoly Sobchak, has taken over the mantle to take Russia to the 21st century.

Why has Yeltsin been changing prime ministers so frequently? A look at Yeltsin's way of functioning through the years of presidency reveals a tussle between the president and the Duma. Over the years the president has grown apprehensive of a danger to the very presidential system Russia has evolved in post-Soviet years. The danger first stemmed from the communists led by Zyuganov; secondly, from the ultranationalists headed by Zhirinovskiy, and thirdly, from the rest of the innumerable factions opposing the presidential system in general and Yeltsin in particular. Yeltsin's forte has been doing damage to these groups and sending them into political oblivion.

The other apprehension is family centred. Under the shadow of Yeltsin's failing health, the coterie around the family has grown more powerful. Active here are people as much from the immediate family as from the political family. The blood relatives are Yeltsin's wife Naina, his first daughter Yelena Okulova and her husband, his second daughter Tatyana Dyachenko and her former and present husbands and a host of people close to her. They include media tycoon Boris Berezovsky, journalist and book writer Valentin Yumashov, former ministers Anatoly Chubais, Boris Nemtsev, presidential staff Aleksandr Boloshin and gas magnate Roman Abramovich. All these people act in a close coterie to Yeltsin and manage Russia and her politics the way they like. Yeltsin, himself incapable of physically overseeing all their activities, gives in to what they say. Tatyana Dyachenko plays the conduit between various factions within the coterie in her official capacity as advisor to the president. Major appointments and dismissals including those of prime ministers are decided in this coterie. No Russian premier has ever been privy to this circle of fortunate few, who take major decisions about Russia's future.

The other consideration is the Luzhkov factor. Moscow mayor Yuri Luzhkov is currently the most popular person. Hand-in-glove with the powerful mafia, Luzhkov is chary of contesting the forthcoming elections, and instead has expressed his support for Yevgeny Primakov. Yeltsin's

alarm stems from the fact that the political equations are fast changing, particularly after the announcement of parliamentary elections to be held on December 19. Experience of the hostile Duma over the past years has compelled Yeltsin and his cronies to ensure that the next parliament is not entirely anti-president.

Yeltsin's last year in power is Russia's most intensely political year. New alignment of political groups are surfacing to take Russian national cause to the people during the two upcoming elections: first in December 1999 for the Duma, and then in July 2000 for the presidency. Yeltsin, who has kept himself away from the public throughout his tenure after re-election in 1996, seems now to be concerned about his political legacy.

In fact, his legacy for Russia is of taking revenge on his comrades of yesteryears and coterie rule. Politicians of different hues and creed agree that right from his 'five hundred days reforms' through 'shock therapy' to total privatisation, he has been a saga of continuous failures. A question that must be haunting Yeltsin in his sleep is: will he be tried for his failures after he leaves office? Russia in turmoil has no clear answer to it; and possibilities are many.

Therefore, Yeltsin along with his close coterie of half a dozen people, has been searching for ways to ensure adequate safety to his political future, economic interest, and physical well-being after he leaves office. Behind the removal of every prime minister Yeltsin had the aim of reducing their stature. Now history may repeat itself at Yeltsin's cost. Since the country's constitution provides for the prime minister to take over the presidency in case of the president's sudden demise, personal reasons and deteriorating health have compounded the issue of succession. Yeltsin apparently wants his trustworthy man in that job. He feels uncertain about the security of his family members and friends, particularly those very close to him, and those who know the details of his shady dealings with the oligarchs.

In recent times, after the dismissal of Primakov, there has been regrouping of political forces. Moscow mayor, Yuri Luzhkov and many regional governors have formed a political alliance. Their objectives are obvious: to gain electoral leverage in the Duma and then counterpoise the pro-Yeltsin nomination in presidential elections. Luzhkov has also hinted at fielding Primakov as a presidential candidate.

On the other side of the judiciary, a legal battle looms large. Russia's dismissed

procurator general Skuratov, who was conducting investigations against oligarch Boris Berezovsky, had successfully handed down the job to his deputy, Yuri Chaika, who in turn, has found money laundering and charges of corrupt banking deals right from Russia to Switzerland. The Swiss authorities are investigating cases against 24 Russians, an action that might snowball into a scandal against Yeltsin and his oligarchs. Haunted by the ghost of financial racketeering and apparently blackmailed by the oligarchs and the mafia, Yeltsin and his daughter Tatyana Dyachenko spend sleepless nights to refurbish Yeltsin's image. However, Yeltsin's presidency is a sinking ship in troubled waters.

It sounds absurd when an incumbent president nominates a successor and announces his profile to the public. But Russia's fragile democracy is mature only to that extent. In the absence of a viable succession procedure, and with scant regard for constitutional provisions, Yeltsin first tried to explore extra-constitutional means of staying in power. Suggestions were few. One debate centred on the very premises of the presidency. Yeltsin was not the elected president of independent Russia in June 1991. He transformed himself into Russia's president after the Soviet collapse in December 1991. That he could contest for a third term was hitched to his actual years as president. The matter was referred in vain to the constitutional court for advice. Irrespective of the merits of this argument, Yeltsin has been president of Russia ever since December 1991 when Gorbachev ceased to be Soviet president. The new Russian constitution provides a maximum of two terms of four years for the president; and Yeltsin is apparently crossing that time limit.

The supporters of Yeltsin have tried an alternative postulate. In case of a Slavic Union with Belarus—its young and visibly effective president Aleksandr Lukashenko might contest as Russian president. But such a union has not materialised. Besides, the western countries would not like Lukashenko simply because he is the odd man out in the CIS. He holds the fort of socialism in the midst of turmoil and trauma of capitalist reforms. He has not dismantled the socialist edifice of Soviet years and has continued to advocate the efficacy of the system, particularly in ensuring social security for the young and the aged. He has rebuffed outside pressures and rejected IMF prescriptions for Belarus to follow. Such a man, the west opines, cannot be trusted to carry on with the burden of

Yeltsin's Russia. Added to all this, Lukashenko is not a citizen of Russia and Slavic Union is not an official entity.

Russia today is polarised between the lofty and the low. On the one hand stand Yeltsin and his daughter Tatyana along with a handful of friends with dubious credentials. On the other, there is Moscow mayor, Luzhkov, speaking for the masses. With him stands the Leviathan of the Russian apparat, and all of them enjoy the support of the mafia. Their number is in thousands. The third group consists of the parliamentarians and law-makers, who have already outlived their longevity in the present Duma. Once upon a time the communists led by Zhyganov and the LDPR led by Zhirinovsky fiercely opposed Yeltsin. However, over the years, Yeltsin has either lured them over or decimated them by political cunning. Although these law-makers now meekly accept what Yeltsin says; they worry the president, who foresees a danger in their possible proselytising in the election year. He keeps dividing them, sometimes wooing, sometimes luring and often punishing. If all the parliamentarians align with Luzhkov, the president fears, the forthcoming election outcome cannot be pro-Yeltsin.

Meticulous observation of Russian political development through the past decade and sensible analysis of the current equation of political forces yield six possible scenarios.

One officially, Vladimir Putin has been announced Yeltsin's successor as Russia's next president. However, there is little credence attached to the presidential announcement because over the years Yeltsin has not groomed anybody to be his political successor. Whosoever analysts considered his successor, be it Chernomyrdin or Primakov, was shown the door unexpectedly. In the given situation, Putin is a feeble contender in Russian politics compared to other heavyweights like Chernomyrdin, Primakov and Luzhkov.

Two, Primakov and Luzhkov are the two names making the rounds in the Russian press as next year's presidential candidates. Neither seek Yeltsin's favour and both are fiercely disliked by his coterie. Although considered a heavyweight, Primakov is currently a political non-person, while Luzhkov basks in the sunshine of power as Moscow's mayor, who enjoys considerable mafia support. Certainly, a combination of efforts by both these politicians would be a lethal answer to Yeltsin and his oligarch friends.

Three unofficial, but a real possibility is the role of the powerful Russian mafia. It is sure to play its role in the upcoming elections, at least for its own survival. There is already evidence of cracks appearing within the mafia: the elite supports Yeltsin; and the rank and file stand by Luzhkov. Any widening of this gap over the next few months would determine the political shape of things to come.

Four, Russia's elections, both to the Duma and presidency, will not be issue-based. By all reckoning, it is likely to be centred around the personality of the candidate. The communists and the ultranationalists, who had entered the Duma in 1995 had considerable popularity in the presidential elections in 1996. Their popularity has however outlived the needs of Russia's electoral politics. They have grown relatively poor and their frequent compromise with Yeltsin's erratic activities has exposed the pernicious side of their vital public role. The possibility of their coming to power is remote.

Five, there is evidence of new political alliances cutting across party lines and territorial boundaries. The recent alliance of regional governors with Luzhkov is a good example. This has generated hopes about coalition politics becoming a reality. Yabloko. Our Home Russia and Fatherland Party may align with like-minded groups to forge a stable alliance in the Duma election in order to give coalition politics a chance in Russia.

Six, with their diversified approach and incoherent agenda, Russia's political parties and groups are too feeble to withstand the onslaught of the incumbent president who is all-powerful. His 'heart beats like a clock' and together with his oligarch friends and mafia barons, he rules the roost in today's Russia. All of them together wish to continue in power. While the ways and means are unclear, it is possible that they would grab power or cancel the elections or declare a state of emergency to prolong Yeltsin in power. This would spell the doom of the country's fragile democracy.

Economic Ideas of V K R V Rao

S L Rao

His view of economics as an integral part of the social sciences, participation in goal-setting as well as the methods to achieve them, aiming at people's welfare and quality of life as the goal of economic development, strong belief in good survey-based data and involvement in policy formulation – these were V K R V Rao's major contributions. As an institution-builder he had the capability, so rare in India, of thinking carefully about the organisational structure of institutions so that they could survive his departure.

I CAN claim to have read much of V K R V Rao's writings, but a long time ago, and I have not re-read them. However, I have had the privilege of witnessing his preparing many of them. I have also listened to many of his addresses. I cannot recall an occasion when a speech by him was not delivered to packed halls. He was a great speaker, and a passionate believer in communication and dissemination of his ideas. In his later years I was also able to talk to him at length about his experiences in his life and his work. In this very personal and unscholarly paper, I attempt to link many of his ideas and his work to his life and upbringing. Those who knew him in his active years will recall his charismatic personality, his gift for clarity and articulation, his enormous energy, his charm, his sometimes overbearing personality, his uniformly equal treatment of people irrespective of their age or position, and his regard for youthful talent. He spotted talent and some of the greatest names in the social sciences, particularly in economics, were spotted by him and given early opportunity and recognition. He was not threatened by young talent, and indeed actively searched for it, and brought it into his institutions.

V K R V Rao belonged to an impoverished Kannada-speaking south Indian brahmin family living in Srirangam, the home of Ramanuja, the great Vaishnavite saint. Throughout his life, he remained a deeply religious man. His father worked for a while as a minor government servant. For some reason, he gave up his job, and disappeared for almost two years, leaving his wife and (at that time) four young children to survive on the meagre allowance of a posthumous daughter by a first wife, which stopped when the lady died suddenly. The father had gone to far away Bombay where he established himself as a practising astrologer to some of the

leading Bombay industrialists and lawyers – mainly Gujaratis.

Astrology was an uncertain profession. Believers use astrological forecasts for decisions about matters where results are not amenable to interpretation. They are more imminent than, say, the estimates by the government's Central Statistical Organisation of the gross domestic product (for which there is no finality!), or the industry ministry's index of industrial production (which assumes too much), or the other statistical tools used by economists. Their forecasts are based on cosmic data, not observation of human behaviour, but they cannot afford to be wrong.

For almost two years the family lived in not-so-genteel poverty on the Rs 20 a month that was the allowance of the step-daughter. Then they were left with no income. They finally found the father in Bombay and the family started getting an erratic remittance. The wife and children went through years of extreme uncertainty and penury, indeed of real poverty. However, V K R V Rao does not seem to have had an unhappy childhood, though he was rebellious, disobedient, and not easily amenable to rules, traits which he seemed to carry into his distinguished adult life as well.

Soon the father sent for the family, and they settled down to life in a one-room tenement in Gamdevi in Bombay. VKRV was seven years old. His father chose him as the one most likely to change the family fortunes. He received preferential nutrition over his older brother and sisters from the uncertain and meagre earnings from astrology. Perhaps this family history might explain his interest in forecasting the future but with a good data base, his interest in nutritional programmes, in equality of opportunity which was his interpretation of socialism, in spotting and nurturing young talent, and in programmes to not

only eradicate poverty but to enable a better quality of life for the poor.

The contrast between the small towns in the far south and the modern, bustling city was striking. Bombay ignited the fire inside him, which till then had found expression only in pranks and juvenile antics. English became his medium of instruction, and the new challenges evoked a quick response so that he had a very successful school and college career. Around this time two of his sisters were married soon after puberty, and both had large families. Indeed, his four siblings who survived to adulthood, had a total of 28 children. With his own three who survived out of six, that was a total of 31 children to be supported by families that were by no means well-to-do. Only one sister completed her schooling, and his brother became a registered auditor which enabled him to practise as an accountant. Two of his three brothers-in-law had to start working in their teens. Bombay was even then the promised land for impoverished south Indian families. The 1920s and early 1930s were very difficult years what with the killer influenza epidemic and subsequent economic depression which lasted almost to the beginning of the second world war. Young boys flocked to Bombay from all over south India to find employment, mostly as clerks and stenographers, because of their good grounding in English and arithmetic. It would not be surprising if these happenings triggered his interest in demography, employment, population control, understanding the structure of the economy so as to intervene for solving social ills, the empowerment of women through education and programmes for their health and nutrition.

Bombay was in many ways the home of the Indian nationalist movement. The darlings of the bright young college students of those days were a great British journalist, Benjamin Horniman, editor of *The Bombay Chronicle*, and Yusuf Mehraully. V K R V Rao has told me that they were leaders of the Young Socialist League and attracted bright young men like him. He had to soon decide whether to be an activist, or merely the intellectual backdrop to the movements. Given his family's desperate need for him to bring in some income soon, he decided against active politics. Instead, he said to me, he became the pamphleteer for the movement. His writings of those days are not to be traced. Perhaps they were unsigned, or as is also likely, he just wrote and then moved on. He did not collect what he

wrote, at any time in his life, making the job of bibliographers and interpreters of his thinking very difficult.

We cannot talk about the important influences on V K R V Rao's economic ideas without referring to his years as a postgraduate student of economics. The thinking of Marshall and Pigou were to deeply influence his view of economics as a social science to improve the human condition. As a student of Keynes, and part of the small group of students who interacted closely with him, he was of course to discover the tools of government intervention to achieve this objective. Colin Clark stimulated his interest in statistical demography and his work on national income accounting.

The strong intellectual basis for his social democratic beliefs was to develop later when he went to complete his postgraduate and doctoral work in the UK, and interacted with the wellsprings of social democratic thought in England like Harold Laski. But his family environment and his early introduction to socialism gave him an unshakeable belief in the equality of man. The influence of Mahatma Gandhi inculcated a far more tolerant attitude to other castes and religions than would normally be the case with a brahmin with a priestly ancestry and from a small town in south India in the old Madras presidency. The social class that he belonged to was intensely caste conscious. The oppression over centuries of the non-brahmin majority by the small brahmin community was to result in a major social revolution. In the next 60 years this revolution was to sweep over the whole of India and fundamentally change the bases of social and political power. VKRV remained true to his devout religious background, but had none of the caste superiority and discrimination. All this developed in him the ideas of equity and social justice, and a passion to improve the human condition, which found intellectual support from his studies in England. His interest in the fledgling subject of economics might well be traced to these experiences.

Gandhiji stimulated his interest in rural India, small industry and the idea of swadeshi. These were to lead to his keen involvement in agricultural economics, and making that an important subject for research in the Delhi School of Economics and the Institute of Economic Growth. His interest in small industry as a means particularly suited to solve India's need for employment and development led to his encouraging the earliest research in this field by P N Dhar at the Delhi School. Swadeshi made him a lifelong proponent and user of khaddar. It also led him to ideas of self-sufficiency, which later led to policies of import substitution. As has

been documented in studies on productivity in Indian industry, the extreme forms that this took in actual policy implementation led to very high import tariffs and quantitative restrictions on imports, making India into a relatively closed economy, with little competition, and low productivity.

What could be identified as V K R V Rao's contributions to economics? The first and the most significant, in my view, was his clear understanding that economics was a social science and that its practice must inevitably mean interaction with the other social sciences. He saw economics as a means to improve people's lives *en masse*, and his interest from the outset was not as much in theory as it was in application and developing policy conclusions. He and D R Gadgil were perhaps the first among economists in India to give it this strong orientation to policy.

Because he wanted to use economics for policy purposes, he was also committed to comprehensive field observation, data collection and analysis. That was what perhaps made him develop the methods to do the first scientific estimates of India's national income, developing in the process a framework which with some modifications is still in use. His work on estimating national income took him to the study of agriculture, in which he made some significant contributions. He became an authority on cotton as one result. He initiated the first socio-economic surveys of refugee townships which helped considerably in understanding the economic and social problems of refugee rehabilitation. These impelled him in later years to initiate other similar studies, some on a continuous panel basis, in Delhi and other towns, and many years later in Tumkur in Karnataka. These ground level studies and the continuous surveys initiated in the Agro-Economic Research Centre that he founded at Delhi gave him the idea in later years of district level planning, and the concept of village clusters for various development actions. The early work of the Institute of Social and Economic Change that he established in Bangalore in 1972 was in this field and he was a keen participant in the thinking behind the panchayat raj experiment developed by Ramakrishna Hegde as chief minister of Karnataka. The institute conducted many training programmes on the subject.

His strong sense of fairness, equality and justice led him in the formative years of the United Nations to develop the ideas of international action to promote development and food security in the poor countries. All his life was devoted to applying his brilliant mind and the concepts that he had learnt or developed himself to one purpose, namely, the improvement of the human condition.

It was in institution-building that he excelled. In another life he would have been a very successful entrepreneur. His imagination had no limits, and he did not consider any task too difficult; only, how he could accomplish it. He dreamt grand dreams, and achieved them. Elsewhere, P N Dhar has described how he visioned the Delhi School of Economics in 1944, when the whole economics department in Delhi University was in two small rooms in temporary barracks, and the faculty consisted of Rao, B N Ganguli and P N Dhar. But his vision of a teaching and research institution to rival the London School of Economics came to pass, and 50 years later its faculty and students are respected the world over.

No description of Rao's ideas can be complete without mentioning his great capabilities as a teacher and as an administrator. At the very young age of 28, he was invited by the great industrialists of Ahmedabad to become the principal of two colleges, one an arts college and the other a commerce college, still among the best in India because of the traditions that he set for them. His experience there might have some bearing on his recommending in 1961, when he was chairman of the Committee on Commerce Education, that the curriculum could be strengthened and commerce education given a great deal more importance in Indian education, because it met the vast needs for trained people in industry. Then, in 1942, Maurice Gwyer, the vice-chancellor of Delhi University, decided to start a Department of Economics in the university and offered the department to Rao. He was 34 when he came to Delhi. He stayed there till 1972, and was actively involved in all the major policy formulations regarding the economy during these 30 years. In 1957 he became vice-chancellor of Delhi University, and in 1960 a member of the Planning Commission. In the latter capacity he tried to bring his economic ideas and thinking to bear on policy and implementation. In 1967 he joined the Congress Party and entered politics, becoming a minister on his election. As minister of transport and shipping, and later of education, he brought his great administrative skills to bear on his portfolios, but there was no particularly new economic idea that emerged out of his experience of active politics.

Let me now take a quick look, through his work, at the influence he exerted on economic ideas and thought. His first published work was on the taxation of income in India. This was his thesis for his Master's degree in economics from Bombay University and was published many years later in 1931. It set the tone for his work in future years, empirical and policy-oriented. It must have been of some

value to him many years later, in 1953, when he was appointed to the Taxation Inquiry Commission under the chairmanship of John Mathai. His work on national income was done in fulfilment of his MPhil and, later, PhD programmes at Cambridge in England. He and Simon Kuznets drove the International Association of Income and Wealth, which sought to standardise methods for national income estimation over the world.

His 'Essay on the Nature and Purpose of Economic Activity' was delivered on his appointment as Professor of Economics in Delhi. At that time the most significant writing on the subject was *Nature and Significance of Economic Science* by Lionel Robbins. Robbins had stressed scarcity of resources and choice between alternatives as the core of economic science. Rao on the other hand stressed that economic activity was of the nature of both ends and means activity, unlike Robbins who urged that economics is neutral as to the ends and is concerned, given the ends to be achieved, with the use of means in the most economical way. This essay demonstrates Rao's approach to economics as an integral part of the social sciences and the humanities, one that must interact with sociology and anthropology. It explains why the two great research institutions that he established had the ends defined in their names, the Institute of Economic Growth and the Institute for Social and Economic Change. It is interesting that at least some economists are moving once more to this view of economics in the nature of their work. PC Joshi has acknowledged Rao's "interest in bridge-building between economics and other disciplines and in the interaction of social science and policy-making" which helped Joshi "to evolve my own interdisciplinary and social action oriented perspective of social science".

According to H W Singer, the evolution of thinking from GNP growth to the reduction of poverty and the satisfaction of basic needs as the primary objective owes a great deal to Rao. Singer traces it back to the work done by Rao as chairman of the United Nations Sub-Committee on Economic Development in 1947 or so. His "analysis of the national income concept as applied to developing countries" was "basic to the first stage of aiming at GNP growth as a development objective". He was perhaps the earliest economist to argue for development oriented towards employment. His theoretical writing on this subject was, in Singer's view, "particularly seminal in the development of the ILO World Employment Programme." Singer goes on to say: "In the later stages, when questions of poverty and basic needs came to the fore, once again we find that

Rao gave early attention to the 'Human Factor in Economic Growth' [written in 1963]". "[H]e was also influential in creating ideas and shaping policy in the international aspects of the attack on the world poverty."

Another area of deep interest to Rao was, according to C H Hanumantha Rao, "the study of the sources of growth of agricultural output and variations in its performance according to crops and regions in India. His presidential address to the...Indian Society of Agricultural Economics...in 1961...was a pioneering study". He goes on to say that "in 1967 he predicted the rising significance of rabi cultivation in Indian agriculture owing to its profitability as well as the relative certainty of yields".

Rao in an article titled 'Deficit Financing, Capital Formation and Price Behaviour in an Underdeveloped Economy' in 1953 in the *Indian Economic Review* made a strong theoretical case for government intervention through massive public investment financed by a reasonable level of government deficits for building the basic infrastructure and the heavy industries, large irrigation projects, etc, essential for the development of an underdeveloped economy. This was one of a series of three articles. His argument about the investment multiplier in a developing economy provided the theoretical underpinning for high direct taxation, incentives to savings, and a large role for government in capital formation. In recent years, east Asian countries replaced this dis-saving by government with a budget surplus. They achieved this with large inflows of foreign capital. The latter, along with strong export-orientation, gave those countries spectacular economic growth for over a decade. The Indian formula, accompanied by policies of self-sufficiency, import substitution even when the result was high cost, massive tariff walls, protection of jobs even at the cost of efficiency, and a negative attitude to export-oriented growth, resulted in poor growth in the 1960s and 1970s, and in the 1980s to unsustainable growth leading to a balance of payments crisis. In retrospect, it does appear as if the desire for self-sufficiency, suspicion of foreign investments, the closing of the economy, the central direction of resources, a commanding role for government in the economy, a belief that growth and social justice could be achieved together through a 'socialistic pattern of society' were ideas that together prevented Indian entrepreneurship from getting a free hand to show its capability, and led to an economy that was not only cut off from the world, but was also inefficient and uncompetitive. Thirty years of economic policies are now seen as having been ineffective. Rao as

a key economic thinker and policy-maker, like many others who are still with us, must bear responsibility for this. Many who participated in developing these ideas and policies have recanted, and are at the forefront of thinking and policy formulation on liberalisation and economic reform. Rao in his conversations with me in the last two years of his life accepted that we had given far too much primacy to government in the economy.

As a footnote, we must not overlook the great meltdown that is taking place in south-east Asian economies as well as that of South Korea. Even Japan and China are likely to see major turmoil as they improve the efficiency of the financial systems in their countries. But these countries did register spectacular levels of growth for many years. As a result, their peoples gained superior standards of living and improved quality of lives. It was in India that the intellectual argument for a major role for the state in economic development, of which Rao was the leading proponent, was developed. It worked for many years in those countries. If it did not work for India, and instead distorted the Indian economy, there were other causes which had to do with the nature of Indian democracy and its bureaucracy.

This cannot take away from Rao's fundamental contributions to economic thinking in India, as has been described in this paper. Economics as an integral part of the social sciences, participating in goal-setting as well as the methods to achieve them, aiming at people's welfare and quality of life as the goal of economic development, strong belief in good survey-based data, and involvement in policy formulation are his important contributions. His monuments will be the many institutions that he built and others that he initiated. As an institution-builder, he had the capability, so rare in India, of thinking carefully about the organisational structure of institutions so that they could survive his departure. The loss of a founding father has led to the decline of many other institutions in India.

V K R V Rao was, in the ultimate analysis, a selfless man. Many who knew him might disagree with me when I say that in a very real sense his apparent ego was in fact a reflection of his passionate commitment to his ideas and his objectives, and his impatience to realise them. He built people and institutions. His judgments were honestly arrived at, even if with hindsight we find that some were wrong. He had no hidden agendas. His thinking was not for sale to the bidder who could pay him the most in terms of money or position. Whatever his ideas and actions, they were meant for the good of the people of India.

Broad-Brush Picture

Prabhu Ghatge

Words Like Freedom: The Memoirs of an Impoverished Indian Family: 1947-1997 by Siddharth Dube; Harper Collins Publishers, India, 1998; pp x+297, Rs 395.

THIS is a consciousness-raising book about the painfully slow climb out of grinding poverty of a scheduled caste *pasi* family in a central UP village. The story is told with a passion that emerges not only from the words of three generations of family members themselves, but also from the author's analysis of the broader political economy. Given Dube's method, the test of the book is whether he gets the 'feel' of it right. This he does admirably, through faithful recording and fine descriptive writing. To take just a few examples: the stoic acceptance of mortality (10 out of 12 of Ram Dass' children died), the true experiential meaning of 'words' like widowhood and caste violence, coping as an orphan, being handicapped, struggling as an 'educated unemployed', making progress as a migrant worker in Bombay, and the role of individual characteristics in the making of differential life fortunes. We get horrific glimpses of the not so recent past "there were no crippled children then in the village... because sick children would all die" or "once when...the rats started dying...we all ran away into the fields and we stayed there for 15 days...whoever stayed in the village died, maybe about 50 people". Illuminating the accounts of the family members are the author's own commentaries on topics like the Congress Party and land reforms, the caste system, movements in the poverty line, Ambedkarism, Indira Gandhi's populism, UP politics, the national failure in literacy. By using the device of the changing fortunes of a single family as a convergence point, the author makes the forces of recent history as well as topics like gender, literacy, health, migration and many others come alive, making the book of great interest to the general reader and placing it in the genre of other well known books that have contributed to an interest in rural development. It will no doubt also be widely used in school and college courses at home and abroad.

While the broad picture is well presented, specialist readers more interested in the details and nuances will have to look elsewhere. Part of the interest of a new

case study is the extent to which it modifies or corroborates the prevailing generalisations. However, this is not a work of economic anthropology. (Indeed, we are never told how the author met the family, how long he spent in Baba ka Gaon, where he lived, etc.) While many aspects of poverty are inherently unquantifiable (the sense of precariousness, exclusion, physical vulnerability, gender relations, legal and other disabilities, in conveying all of which so well Dube helps to redress an imbalance in the poverty literature) there are other aspects of poverty that are best measured. To take just one example, wages are a measurable variable not only at the level of the single household, the author's unit of analysis, but also surmount the sample-of-one problem in being uniform for the village as a whole for long periods of time, as analysed in another recent study of a UP village (*Economic Development in Palanpur over Five Decades* edited by Peter Lanjouw and Nicholas Stern (reviewed in *EPW*, June 12, 1999)). Like *Words*, the Palanpur volume spans the last 50 years and tells a similar story of slow and modest economic gains but wide-ranging social and political failure. Given the scope and depth of the Palanpur volume it is probably the definitive study so far of rural development in the Gangetic plain, and will be used here as a comparator for *Words*' findings. On wages, *Words* supports the Palanpur volume's finding that wages were stagnant (rose very slowly) till "about ten years ago" (the mid-80s). However, we are left wondering why they were so much lower than in other UP villages at 1.5 kilos of grain a day, how much they went up by as result of the concerted refusal to work for less than the 'government' wage of Rs 18 at the time, how much are they now, etc.

While the author draws liberally from the literature and his understanding of the broader 'macro' context at the national and state level, only a sketchy picture emerges of many aspects of the immediate village context. While a village study was not the author's objective, he could perhaps

have garnered more information from other villagers and the available village records on contextual questions. Thus only the broadest picture emerges on the distribution of castes, holdings, and occupations, the extent of migration, regular employment outside the village, irrigation, tenancy, etc. One result is that the rest of the village remains undifferentiated. While the advantage of focusing on three generations of the same family gives us a good sense of slow progress over time, it would have been more satisfying to see for ourselves rather than merely being told at the outset that the family belongs to "that small percentage of the poor" which has escaped poverty. The reasons for the escape may have been even more untypical. The crucial events in the family's escape from impoverishment appear to have taken place some time ago when Ram Dass's father and uncles migrated to Bombay to work in the railways. Ram Dass and his son Shrinath followed them for spells in turn, enabling Ram Dass to pay off the family debts (we are not told how much these were) and to buy some land, and enabling Shrinath to get an educational edge over other village children to eventually become a teacher and buy more land. The family ends up with an operational holding of 5 acres (half owned, half share-cropped). As important as a source of income is Shrinath's job.

We learn only from the Palanpur volume however that the *pasis* are unusual in having a greater historical exposure to the outside world, mostly through railway work, and that many of them migrated originally from eastern UP with the expansion of the railways (an example of the importance of caste-based connections in securing outside employment). Jatabs on the other hand, the largest and poorest SC group, continued in Palanpur to have extremely limited access to regular (as opposed to casual and semi-regular) employment at the end of the 50-year survey period. Largely as a result of this difference, the per capita income of the *pasis* was three times higher than that of the jatabs. It was second only to the *muraos* (or *mauryas*, a cultivating middle caste) and higher than that of the *thakurs*, the dominant caste in both villages.

Further, did the growth in the size of the family's holding make its experience much more typical of the middle castes than of the SCs? The Palanpur volume documents the ascent of the *muraos*, which began with the abolition of zamindari in the

1950s and the tenurial changes that followed, consolidated by the skilful use of technical change and the increase in real wages which gave them an advantage over thakurs who used to rely intensively on hired labour. As a result of land sales and a relatively high rate of population growth, per capita landownership had declined much more for thakurs than for muraos. Tenancy had the effect of further reducing caste differences in land cultivated. However, as we are told was the case in Baha ka Gaon, there was little improvement in the economic condition of the jatabs, who continued to live in conditions of acute deprivation on the margin of society, a "caste apart". By the end of the survey period, thakurs owned about a fourth as much land as they had in per capita terms.

These trends may not have been so marked in Baha ka Gaon (BkG), (nor was the author equipped by his method to measure them) but they illustrate the importance of an understanding of context. Of course, the author would be justified in pointing out that if a pasi family had to struggle so hard and for so long, one can imagine the plight of the poorer families and the destitute, aspects of whose experience he does describe.

The broad-brush treatment of village-level variables including anti-poverty programmes gives us no sense of the nuances in the relevance and implementation of different social security, basic needs and redistributive programmes. While the overall feel conveyed of tokenism and callousness (e.g. in the administration of widow's pensions) has resonance, some of the programmes surely work better than others. Shrinath himself says about the distribution of new house-sites, "at least this was done honestly!", and the family did receive two-thirds of an acre of farm land (in another place we are told one-third) as did apparently the rest of the village. Tarring every programme with the same brush of leakages leaves us with no sense of the way forward – do we throw all the schemes out, or are there any design and incentive issues that might improve things? The example of the hand-pump that had been put up as a 'show' for Rajiv Gandhi's visit to a nearby village is probably a bad one – Jean Dreze and his colleagues in a chapter in the Palanpur volume found public hand-pumps to be one of the few schemes out of the 18 examined that were widely welcomed by the poor. Another useful scheme was the seed store, whose credit operations are contrasted with the Farmers Service Society, which had been honed into an instrument to defraud poor borrowers. (An

interesting question arises – has action ever been taken in clearly documented cases of corruption such as this, although the evidence is thrown up as a by-product of social science research? Is the Development Commissioner listening?) The consolidation of holdings was another successful programme, since it had the backing of politically influential groups such as affluent landowners.

At the other extreme, the consistent neglect of the basic needs of politically disadvantaged groups, such as primary education and health care, is laid by the Palanpur book at the door of the failure so far of state politics, local democratic institutions, and more generally of collective action. Adversarial collective action does succeed sometimes as in the 1995 panchayat elections in BkG when the maurya candidate unseated the thakur incumbency of the post of pradhan for the first time since 1952. We are told that the elections irrevocably changed caste equations in BkG, but not what difference it made to outcomes. One looks to a postscript in a subsequent edition to show what this meant in practice to redistributive programmes. In Palanpur it made very little difference when a backward caste gadaria ("a notorious thug") replaced the thakur pradhan in the same elections.

As for collective action of the co-operative variety, the mystery remains. Why is it so rare? It does not entail the costs of adversarial collective action, including violence, well documented by Dube in the 1995 BkG election, nor is it forthcoming even in situations of homogeneity, as in the failure of neighbours to dig siltage pits for effluent from hand-pumps, or to contribute shramdan for the paving of village lanes, or report the village school teacher for non-attendance, some examples analysed in the Palanpur book.

While Dube's analysis is admirably holistic, there is little doubt that the factor he holds responsible for the continuing "perpetuation of mass poverty", the title of his last chapter, is the failure to implement land reform. He brings out very well the history and political economy of this lost opportunity ("original error") but insists the scope for further redistribution is "still gigantic" and would significantly reduce poverty. However he fails to test this assertion against the evidence of his own village. Putting together numbers contained in different parts of the book in the testimonies and his own commentary we learn that in a village of about 850 acres and about 100 families two thakurs had about 35 acres each, and the remaining 20

smaller thakur holdings and about 8 brahmin and middle-caste holdings had an average 10 acres each. We are never told how the rest, presumably more than half of the village land, is distributed. But even if the two large holdings were above the official ceiling (we are told they were, but not what the ceiling was in their case, or whether any attempt had been made to enforce it) it sounds as though partitions though succession have made land reform a historical issue in this as in the vast majority of western and central UP villages.

This does not mean that it may not still be possible to give most if not all villagers title to small pieces of land under consolidation of holdings operations, which provides for the appropriation of about 5 per cent of village land for approach roads, village commons and related purposes. The Palanpur volume says there is no active resistance to this policy and there probably would be none if the level of appropriation were raised to a level adequate to provide an acre to each landless labourer (requiring an additional appropriation of less than 2 per cent of village land). While this would not achieve much in terms of egalitarian objectives, as the authors point out, it would be an important step in raising both the status and social security of the allottees. Such distribution on a smaller scale have taken place in the past in both villages, but have been plagued not only with the poor quality of the land distributed, but also with corruption, inability to take possession, and other implementation problems. The problem with an excessive preoccupation with what might have been is that it diverts attention from tackling such problems, and from pursuing other approaches that might now be much more promising such as massive land development programmes, or financing the purchase of land by the poor as some of the state scheduled caste corporations are doing (e.g. in Andhra Pradesh).

The rather strong conclusion in the last sentence of the book – "In the future, as in the half-century past and in centuries earlier, India is destined to remain the land of hunger, want and suffering" – is premised on a continuation of failure to undertake widespread reforms. While one cannot disagree with the basic diagnosis as political failure, the more interesting question is what is the scope for manoeuvre within this constraint, how can it be relaxed and with what programmes? Books such as this sensitise us to the problem, but it remains the task of careful social science research to show us the way forward.

Probing an Area of Silence

Shilpa Phadke

Question of Silence? The Sexual Economies of Modern India, edited by Mary John and Janaki Nair; Kali for Women, New Delhi, 1998; pp 412 Rs 420.

IN the 1990s sexual health and sexual rights have become important areas of inquiry and intervention at the international level. The discussion of these polemical ideas, which was until recently restricted to the academic milieu and to the feminist movement, has undergone a process of legitimisation in international fora. The concept of sexuality is one among those which have been recently discussed and included in the programmes of action of the International Conference on Population and Development (Cairo, 1994), the Fourth World Conference on Women (Beijing, 1995) and the World Summit for Social Development (Copenhagen, 1995). Sonia Correa (1996) points out that despite such apparent acceptance, it continues to be important for feminists to clarify meanings associated with concepts like gender, reproductive rights, and sexuality to counter the possibility of oversimplification or distortion.

In India, too, recent work by feminist scholars has problematised sexuality as an important area of research to understand gender concerns and the myriad crises of modernity. The essays in this edited volume attempt both textual and contextual analysis as they address various operational dimensions of sexuality, and attempt to uncover the rationales of political economy that underpin them. As such, they engage in discussions of race, caste, nationalism and politics, media and popular culture, consumerism and capitalism with relative fluidity.

Perhaps more interesting than the individual essays themselves is the fact of their being together in one volume. In an incisive 'Introduction', the editors have successfully tied various threads and themes, simultaneously providing a cogent and comprehensive overview of the many complex debates surrounding the issues of sexuality, reproductivity, violence and the ways in which these are enacted on women's bodies. They have also looked at the debates from the perspectives of different disciplines and discourses: demography, anthropology, law, art and media, being some among them.

It is with some delight that one encounters editors who successfully manage to take their project very seriously without taking themselves too seriously. Wry comments about how some issues have provided more than their fair share of grist to the academic mill are adequate testimony to this. "For instance", they write, "over the past 10 years, studies, of the social

arrangements within which devadasis worked and flourished in the period before colonial decline have burgeoned into a veritable cottage industry" (p 11).

In 'Unravelling Kamasutra' Kumkum Roy focuses on the socio-cultural context of the 'sutra' and tries to lay open its complexities and ambiguities and the fact that women's sexual subservience represents a continuity. Roy examines, on the one hand, the codification of the Kamasutra and the disjunctions between prose and verse that are apparent in the process. On the other hand, she analyses the more modern problems of translation: selection and interpretation in the context of patriarchal society.

Samita Sen analyses how the issues of women's employment and migration in colonial Bengal were closely linked to male control of both women's sexuality and labour power within marriage and the complexities that arose from differences/gaps in law and custom. Anandhi S examines the complexities of the birth control debate in colonial Tamil Nadu. She addresses debates by referring to the eugenic justifications of birth control vis-a-vis caste and class lines, the linking of Indian women's sexuality to marriage and reproductivity (as opposed to the 'sexuality materialistic' western woman's body). Most relevantly, she discusses Periyar's advocacy for women to have control over their own bodies.

Tejaswini Niranjana interrogates the categories of 'modernity' and 'Indianness' to understand questions of gender, race and sexuality in Trinidad, and juxtaposes these with the experience of 'Indian nationalism' and 'womanhood' in the sub-continent. Uma Chakravarti discusses the crisis of the Indian state in the late 1980s and relates this to the spate of television serials ('Udaan', 'Sangarsh' 'Ramayan' and 'Mahabharat') which appeared to respond 'dialogically' to the crisis of legitimacy of the Indian state. These serials according to Chakravarti, could have been sanctioned for the express "purpose of ideologically reconstructing the fragmented nation" (p 244). In particular she interrogates the tele-serial 'Chanakya'. 'Chanakya' is presented as authentic history and constructs India as a "strong, unique, spiritual and decisively Hindutva nation" (p 250). Celibacy is valorised as enhancing male vigour and women are relegated to stereotypical roles. This, Chakravarti avers, has relevance for the contemporary politics of the Hindu Right.

U Vindhya analyses issues of gender and sexuality in Andhra Pradesh in the context of the pioneering creative work of Chalam who successfully initiated a feminist debate, more particularly a feminist critique of the revolutionary left which in turn can transform the quality of revolution as well.

Susie Tharu discusses the journalism and writing of the Gujarati writer Saroj Pathak. She contends that Pathak's work focuses on "the oscillations, impasses, irresolutions that menace Indian modernity" (p 217). In Pathak's writing, sexuality thus becomes an important site for diverse arguments on citizenship and subjugation in relation to the Indian state in the 1960s. Ravi Vasudevan looks at the question of sexuality through the prism of the narrative form of popular Bombay cinema through a critique of the film, 'Awara'.

In exploring the cultural components of modernity, Kalpana Ram introduces the lens of subjectivity in her ethnographic study of construction of puberty among the coastal women of Kanyakumari district. Using the medium of orally related biography, Ram locates the puberty ritual and its understanding within the wider construction of masculine power and sexuality that have been given a new life in the politics of Dravidian cultural nationalism. Using her work with battered women in Madras as a resource base, V Geetha discusses the language in which women articulate their feelings on marriage, desire and sexuality, and analyses the category of the masculine contained in these expressions. In conclusion, she argues that "violence is the form assumed by sexual love in the conjugal context" and asserts that "eros [has] to be rescued from the domain of the family and conjugality... The right to be free from sexual hurt... the right to demand in the most intimate of relationships, an accountability to freedom, equality and dignity..." (p 324-25). Prem Chowdhry, in the context of rural north India, analyses the threat posed to patriarchal and patrilineal kinship linkages by marriages that infringe cultural norms and practices of endogamy and exogamy, and the subsequent violence inflicted in those who break these codes. An important aspect of such enforcement is the control of female sexuality, and reproductive and productive powers. This is particularly the case with upper caste women. Lower caste women, on the other hand, by definition have neither 'honour' nor 'purity' to protect. Chowdhry addresses the complex linkages of caste, gender, control of land and property and the new urban influences which mediate these experiences.

Using globalisation as a lens Mary John interrogates the area of sexuality with reference to the media, the various political economies of the 'beauty' industry and the

opening of new spaces to understand sex and conjugality in popular Hindi cinema. This is perhaps the most significant essay in the collection, not the least because it charts out future research agendas in sexuality. John's highlighting of the institution of marriage puts heterosexual desire and intimacy back on the feminist agenda as an important area of inquiry and theorising. John points out that critiques of heterosexuality (its intimate connection with patriarchy exemplified in the slogan 'the personal as political') resulted in a climate where not only was heterosexuality seen as politically suspect but also seen as unthinkable within feminism. Through her focus on heterosexuality, John has drawn our attention to the loss inherent in such hegemony.

Some western feminist scholars have also put forward similar arguments. For instance, Jane M Ussher (1997) points out that the radical feminist rejection of heterosexuality may not correspond to many women's lived experiences, and may lead to feelings of guilt or shame at the pleasures and desires in which they indulge. She argues, very relevantly, that "it is not only heterosexual sex that is associated with issues of power... Lesbian (and gay male) sex is not immune from power games" (p 229).

In recent decades, there has been prolific work in the area of gay and lesbian sexuality and rights but the sexual rights of heterosexual women have elicited more silence than anything else. Women who are heterosexual by choice find themselves caught between images of women as victims of sexual violence on the one side and the rights debate in homosexuality on the other. Women, theorising on heterosexual pleasure, run the constant risk of being accused of trivialising the issue or, worse, of being traitors for 'sleeping with the enemy' and seeking pleasure in it.

The contraceptive revolution in the west led to the sexual revolution in the 1970s. In retrospect, this revolution has been critiqued by feminist scholars as a male revolution. However, Barbara Ehrenreich et al (1986) point out that the sexual revolution also meant substantial gains for women. They point out that the notion of heterosexual sex changed to a more open-ended and varied kind of encounter.

In India, on the other hand, the introduction of contraception and even the legislation of abortion were linked to demographic goals and family planning programmes rather than having any significance for sexuality. Even today, for Indian women the Sitaesque ideal of chastity continues to exercise enormous importance.

While, particularly in urban contexts, there is an increasing incidence of sex outside matrimony (pre- and extra-), this is still stigmatised and must be conducted in the strictest secrecy. While many popular magazines are discussing sex and sexuality, it is yet to become an arena where women and men meet as equals. Sexuality, in the Indian context, is still in many ways shrouded in silence as the title of the present volume suggests.

From Kamasutra, the text, to Kama Sutra, the condom, the book takes one on a rigorous journey through various pre-colonial, colonial and post-colonial contexts. The essays are well researched, if not always insightful. The book, however, effectively raises several significant and timely questions in the area of sexuality and makes a valuable contribution to the growing body of literature on the subject.

NEW FROM SAGE

A MANUAL FOR CULTURALLY-ADAPTED SOCIAL MARKETING

Health and Population

Edited by T SCARLETT EPSTEIN

This manual is a user-friendly guide for all those engaged in social development - especially those focusing on issues of health and population - who wish to successfully bring about changes in human behaviour. The effectiveness of social marketing is considerably enhanced if it is in tune with the culture of each target society. To this end, the authors have formulated a culturally-adapted approach to social marketing which they call CASM. The manual presents six case studies of the successful application of CASM in different parts of the world. Each chapter has a list of recommended readings, while a questionnaire on readers' views on CASM completes the book.

DISINVESTING IN HEALTH

The World Bank's Prescriptions for Health

Edited by MOHAN RAO

The Structural Adjustment Programme (SAP) propounded by the World Bank and the IMF was introduced in India in the 1990s. Bringing together activists and scholars from diverse disciplines, this volume constitutes perhaps the first critical appraisal of the likely impact of the SAP on India's health policies and programmes. In addition to developing methodological and conceptual critiques, these original papers provide empirical data within which policy implications can be located. The volume advocates a people-based and humane model of health care and draws attention to the need to reconsider many of the questionable assumptions which inform the current approach to the health sector in India.

What Is Happening Inside Indian Democracy?

Javeed Alam

The processes around democracy in India have detached themselves from the infirmities surrounding democracy itself, whether these be of the leaders or the parties, and have acquired an autonomy of their own. The deepening legitimacy gained by democracy inheres in these processes which provide the space, now contracting, now expanding, for the range of resistance people are capable of. This has been happening in spite of the shape that organised politics has acquired and points to the need for a radical revision of theories of legitimacy and of how it comes about and where it resides, as elaborated in academic studies.

DEMOCRACY in India is well over 50 years old. It has survived with full and equal legal citizenship. Its survival has belied the prophets of doom who had since the late 1950s, starting with Salig Harrison, prophesied its oncoming demise. Not only that nothing of the sort happened, but Indian democracy could even overcome the trauma of emergency terror with only a few scares on its body politic.

Contrary to the general perception among the educated strata, it is possible to show that democracy in India has acquired deeper roots over the last 50 years. People are more favourably disposed towards it today (with all the shuffling of governments, instability and what not) than they were in the post-Nehru era under Indira Gandhi with all her radical populism which marked her ascendancy in the first phase as prime minister. All this may seem intriguing, but is what has happened, as data will show. In fact we are in for some real surprises when we scan the data on Indian politics today.

All this is so in quite a paradoxical way. The intelligentsia is dot right when in numerous ways of expression in newspapers, T V, books and journals they have concluded that people across the social spectrum, looked at as modern classes or active communities of caste and religion, have become sceptical of the functioning of the government; that is, in other words, they are mistrustful of or have a low esteem for political leaders and political parties and what they talk about and promise. Yet from that to infer that democracy as a system of governance has become suspect is to make an unwarranted jump. As we will soon see, logical deductions do not hold good in understanding the complex and contradictory connections and their perceptions which partially go to make the functioning of democracy possible in our country. This will also show that the consciousness of the people is inherently

internally contradictory and the contradictory elements may hold good for a long time without necessarily having any adverse impact on the popular acceptance of democracy.¹

An overwhelmingly large number of our people are living under simply disabling conditions. They are reeling under abject poverty, discriminations and lack of facilities to realise their meagre wishes, leave apart having capacities to become what they may be capable of being. So it often becomes common sense to assume that they would much rather like, in some form or other, a satisfactory solution of these problems over, what is considered by many, the luxury of freedom or the somewhat spurious electoral choice. But what seems evident logically is patently untrue. They would not like to have democracy denied to them for a promise of solution of their problems through a non-democratic government. In other words, to put it in a slightly technical language, there is an obvious discrepancy between efficacy and acceptability of parties and leaders on the one hand, and trust and confidence in democratic rule and legitimacy of institutions informing that rule on the other. The question is not only how such a situation comes about but what makes it persist for so long.

I will begin this account of democracy by putting forth for consideration some data on this issue: that is, the nature of assessment of democracy and the powers that surround it.

PERCEPTION OF INSTITUTIONS AND GOVERNANCE

When we scan the data on people's assessment of democracy in India a rather complex but highly revealing picture emerges. Democracy is both a system – norms and procedures and a set of institutions – on the one hand, and actors and functionaries and officials who run

these on the other. For the people it is also a pattern of experiences. The experience of these two facets is at sharp variance; that is, when seen from its general side like the norms or values or procedures laid down as against the concrete experience of those who become in charge of giving these a shape or who work them. The complexity which reveals an interesting feature has to do with contrasting assessments of these two facets of democracy – the system and procedures and how they are made to work. In any society there is always a possibility of a certain discrepancy between these two facets, though we have no way of comparing different societies; yet in our situation the discrepancy is very glaring. In clarifying the reasons for the contrary assessments we will be able to understand the shifts which have come about in the experience of people over a period of 25 years; that is, between 1971 and 1996, the two points at which data were gathered through a cross-polity survey of popular perceptions of socio-economic and political variables.² Let us have a quick look at some of this data. And let us start with specific institutional mechanisms of democracy, viz, the vote, the representation and political parties and leaders, before we put all these together and look at democracy at a general level.

More people now in 1996 believe, close to 60 per cent, that their vote has effect on how things shape up in the country. Twenty-five years earlier in 1971 only 48 per cent thought so. This is an enormous increase in the trust people have acquired in the potential and power of their vote. This is also reflected in the fact that for ordinary people the act of franchise has by now become a carnival of democracy, a celebration of their power. Now this is no simple error of judgment on their part because in their assessment of other related or proximate institutions – variables – there is a consistency with this which is

noteworthy. Look at their approval of the system of representation. About the same number of people think that election of representatives is an important part in making the system work. Likewise a slightly larger number, 61 per cent, consider political parties as important institutions in the working of democracy. This is an enormously high level of trust in and approval of some of the key institutions of democracy viewed especially against the background of illiteracy and poor levels of living of the majority of the people. We will later see that if we were to look at this approval in relation to classes and communities, the poor and vulnerable people show a higher degree of approval than those who are better off or occupy vantage positions.

The fortitude with which people express this trust in some of the democratic institutions and mechanisms as noted above really comes as a surprise. It is surprising in the extreme because this trust sustains itself in the face of the fact that more and more people, around 63 per cent, now think that the representatives they chose do not pay attention to or care about what the voters think, whereas only a few, just about 22 per cent, think that they care. Now this low level of the sense of efficacy of people who get elected in contrast to the high level of esteem in which the system of representation is held is indeed a source of anxiety. In 1971 the number of people who thought so was less at 58 per cent. Also important to note in passing is the fact that those who rated the effectiveness of their representatives highly is down from about 27 per cent to 23 per cent between 1971 and 1996. It is quite obvious that though people value the system of representation, they do not find the representatives elected by them as worthy of regard. This tallies to a large extent with their assessment of government officials who run the administration which is important for their everyday life. Only as low a number as 31 per cent think that the relations between government officials and people are cordial. A still lower number, 28 per cent, are of the opinion that the attitude of the police towards common people is humane. Looking at the bureaucracy at large, as high a number as 42 per cent do not at all have trust in it and as high as 57 per cent do not trust the police at all. (It therefore should not come as a surprise that more than 80 per cent of the people have never contacted any political leader or government official for any of their needs or problems.) It can be easily shown that this is no random reflection of the attitudes of the people.

They do assess some other institutions quite highly and on this count their assessments may well be quite in tune with those of the informed critics of the system of parliamentary rule in our country. For example, over 75 per cent of the people think that the judiciary and the Election Commission function in a commendable manner.

DEMOCRACY AS AN ARENA OF PARTICIPATION

Now when we come to the system called democracy – not how it is conceived of by the people in respect of this or that aspect but its overall experience – the matter is entirely different. And this is where a crucial rupture comes in the way people have learnt about and relate to politics. Their experience of politics has a complexity which has not been captured in our academic or journalistic accounts of Indian democracy. And it is precisely here that we also notice that simple logical deductions do not help in the understanding of the intricate manner in which implications are drawn from experience by the people. Democracy for the common Indian is something he would not like to see replaced even if another system is offered to him on grounds of quicker solution to his problems. The dissatisfaction and alienation from leaders, parties, and certain institutions do not, in their eyes, discredit democracy as a system of governance. When it was put to them that if there were no parties and elections were not held, did they think that the government of the country would run better, the suggestion was summarily rejected. Close to 70 per cent of the people said no and only 11 per cent thought that it would run better. Whatever has been happening to the parties, on which there is no need of a commentary here and the supportive institutions which too have seen a rather pronounced decline over the last two decades, has not effected people's faith in democracy as the space for struggles. In fact, their confidence in it has grown and become widespread. Twenty-five years back in 1971 far fewer people, 43 per cent only, thought on the same lines. There were more undecided people then, 42 per cent, whereas now when only 19 per cent do not have a clear opinion, only 14 per cent felt that it would run better without parties and elections. There is then a difficult angle in the perceptual perspective. The more observable or tangible a feature of politics like the leaders or the parties with which we directly interact, the less the faith in it. The more removed from direct experience a phenomenon like democracy in general

the greater is the faith in it; that is, contrary to what one may anticipate, as we move from the abstract to the concrete the trust declines. As I will try to show later, democracy in popular experience is not a conceptual entity but a set result in their life conditions. What makes the data on this matter quite reliable is the high degree of agreement, as we have seen above, in the assessment of the effectiveness of the vote and the system of representation on the one hand, and on the other the acceptance of democracy in general terms as something desirable. Now let us look briefly at the time – the 25-year gap in the two sets of data – over which this extensive approval of democracy as a welcome presence in our politics has come about.

1971 was the high mark of radical populism and a triumphal moment for Indian nationalism. The survey then was taken after Indira Gandhi decisively defeated the conservative wing in the party and to isolate them went about announcing one radical measure after another, culminating in the most catchy slogan ever coined in Indian politics, 'Garihi Hatao' (remove poverty). All this turned into euphoria with the defeat of Pakistan in the war and the creation of Bangladesh out of the erstwhile Pakistani province of East Pakistan. But surprisingly, the period following this moment of electoral triumph was one of momentous challenges to the Indian state. Instead of consolidating on this triumph the Indian state soon faced very sustained popular assaults. There was a popular revolt in Gujarat followed by a protracted mass movement in Bihar and soon these grew into what came to be called the JP movement, a mass movement all over India. How and why this came about and its consequences will be looked at later in another paper. The period also saw an intensification of earlier forms of struggle – agitations of the working class – culminating in the great railway strike.

The Indian state, which was going through a process of rapid centralisation of power ever since Indira Gandhi effected a split in the Congress Party in 1969, met all such challenges to its authority by increasingly sharp authoritarian measures. More people were arrested during this period and more of them died in police firing than at the time of the Quit India movement. All of this climaxed into the darkest chapter in the history of independent India, the jettisoning of democracy and the imposition of internal emergency. Authoritarianism which was sporadic and ad hoc in Indian politics till then became institutionalised; happily for us it lasted for only 19 months.

Now a feature of Indian politics then which persisted into the 1980s is worth recalling in passing before going further with this account of what is happening to Indian democracy. Beginning with 1971 when Indira Gandhi received a massive mandate from the Indian people when the united opposition, barring the communist parties, called the 'grand alliance' was routed right through to the 1984 elections in the wake of Indira Gandhi's murder which also saw a murderous frenzy, an invitation to the cold-blooded massacre of Sikhs, which catapulted Rajiv Gandhi into power with the largest majority as well as vote, Indian politics has been witness to rapid popular reversion of moods. The same people who voted the governments with huge mandates soon turned against their own governments and the Indian state was under constant popular assault. The phase following the 1971 elections we have noted above. The Janata government which followed the defeat of the emergency regime and which restored democracy faced the same situation in the way of popular agitations. The same had been the case in 1980 and 1984. This is an important indicator of the unresponsive nature of the ruling class vis-a-vis the problems of the people and the lack of adequate accountability of the governments of the day. All this finally ended after the 1989 elections which ushered in the era of coalition or minority governments which is still with us today.

Now it is clear that this phase of politics devalued the leaders, political parties and certain institutions which lost their autonomy and were converted into mere instruments of powers that began during emergency and have more or less remained so ever since. It is therefore understandable that people have lost faith in them. With the incessant revelations of cases of massive corruption and defrauding of public funds by the political leaders from the prime minister downwards, Rajiv Gandhi with Bofors and Narasimha Rao in innumerable cases, it is unlikely that the political leaders will soon regain the faith of the electorate. Nor is the story of political parties any better, barring the Left and the Right reactionary BJP and some regional parties. It is important to keep this in mind. The disease actually afflicts the centrist parties which have been singly or in combinations providing the government at the centre. People see what the Congress has done to the country and rebuff it and what comes in its place led by Janata Party or Janata Dal tries to rule with good intentions but cannot hold for long. Splits and self-disruption seem to be built into

it. Where do people go from here? If not BJP, it is only one or the other centrist party which can provide the core of the government. So when people actually talk so negatively of the political parties it is really their experience with the unseemly behaviour of these centrist parties which they have in mind.

Before looking into the reasons for the strong and widespread approval of democracy as a system of governance when much that surrounds it is suspect, we must note an implication of the approval as a significant fact. Approval for democracy now after its long journey through turbulent times stands on its own. It is valued for its own sake. It does not any more, like earlier, require crutches in the shape of tall or powerful leaders to survive. These were the guardians of democracy and the trustees of the people. It was Nehru's deep commitment or Indira Gandhi's false populism which provided democracy with the cushion to survive in, what was considered to be, an inhospitable environment. Emergency changed all that. It showed people what it means to lose freedom. Retrospectively they also learnt that it is possible to fight for liberty, even if not really extensive; and along with this they also realised how precious is its possession even when poverty stares them in the face. Ordinary people were always subjected to institutionalised violence, oppression and terror in Indian society, apart from exploitation which is normal in every class divided society. But all of this except exploitation was ad hoc and sporadic in nature earlier. Emergency made it systematic and pervasive to the extent that the privacy of the person, though little, was daily invaded by the lumpen elements of the ruling party and the agents of the state. What we today call the criminalisation of politics becomes a feature of Indian politics in a systematic way since then though one cannot deny its intermittent presence earlier.

Today in spite of the leaders and elected representatives, it is the environment of public opinion which provides sustenance to democracy and the leaders manage to be worth something because democracy cannot be run without the system of representation and because elections cannot be fought without the parties and their leaders. Leaders, formations around them and parties are the necessary means through which alone the representative system can work in large democracies like India's. In other words, one may be quite right in inferring that many parties and their leaders and other representatives are being tolerated because people want democracy

This reversal from earlier phases is important in itself. It provides a better grounding to the democratic institutions and compels practice to be, in some minimum degree, in conformity with the norms which sustain democracy. In the words of the debates in political theory what we have been witnessing is the shift of legitimacy from the authorities to the regime or from the political class to the institutional set-up. This is the biggest gain in the political realm of 50 years of experience of democratic politics; its inadequate performance but together with a chance to make oneself heard. Democratic polity seems now finally to have become integral to political consciousness. It seems now to be a choice of the people rather than something given to them.

Before we proceed further a note of caution about an inherent danger to the survival of democracy is needed here. In spite of the deep conviction people have acquired in the overall worth of democracy, it may still be swept off by a demagogic intervention *a la* Vajpayee or Advani; not because they are shrewd but because there is an element within the popular perception which can become potentially unsettling for the survival of democracy as an institutional and procedural system. Struggle for power, I presume, is suspect in India. 60 per cent people feel that parties struggling for power is bad. They do not; it seems to me, realise that majority in a democracy is a contestation; it is made and unmade as one struggles for power. It we do not consider this struggle as something intrinsic to democracy, it is difficult to conceive how majorities can be made and unmade. It is therefore not very unexpected that 73 per cent of the people think that a strong and determined leader is what is needed to tidy up the political mess and a mere 8 per cent disagree with this. In a country which abounds with demagogues and whose number is increasing day by day, this is a bad forewarning. This is precisely the sense in which in the beginning I had talked of consciousness as (potentially) inherently contradictory and unstable. The legitimacy of the system has to be seen in the circumstance of this inheritance of a deep-rooted contradiction of the popular consciousness. That the BJP's campaign for a presidential form of government which is supported by an assortment of political opinions has ominous implications.

Legitimacy for democracy means in other words that it has acquired social roots. This in turn implies that legal and constitutional guarantees are not the only sources for the practice of democracy but

popular mood now is its chief foundation. All this suggests that democracy now in Indian society is a model morally approved by the people. It does not any more need guardians or trustees protecting it as earlier. This means that highly respected leaders as Nehru and others who were seen as embodying the legacy of the Freedom Movement are no longer the only basis for the survival of democracy.³

TERRAIN OF LEGITIMACY

How did this come about? Indian governments have solved none of the basic problems of livelihood – food, shelter, health, work, etc – whether suffered singly or collectively by the people. That these problems are less severe or that fewer people statistically speaking are victims of these problems is a moot point. Also the point is not that there has been very little development in building a modern economy in India. Even if it is less than what India was capable of, it is quite considerable looked at from the sheer increase in the size of science and technology, industry, agriculture, infrastructure and so on. But what singularly marks the Indian experience with development even when we compare it with not east and south-east Asia but even countries like Tanzania, for instance, is the complete inability of the Indian style of development to solve the basic problems of poverty, health, literacy livelihood, housing, etc. Economic and technological development in India, in other words, has failed to solve social problems. So obviously the growing acceptance of democracy is not because it has solved the problems of society. Thus the Indian experience with democracy seems to me to be somewhat unique. Where then do we look for the explanation for such widespread acceptance of democracy as desirable?

The clue, I would like to suggest, lies in what has happened to the social structure with the working of democracy in the context of the development of capitalist relations in India. This has unhinged the rigidity of the mechanism through which social conformity of the most severe kind was conventionally enforced. All traditional societies enforce strict conformity; that is, codes both at the level of morals and conventions are not advocated but imposed: force rather than persuasion is the mode of enforcing compliance. This is important because advocacy implies persuasion whereas imposition is evidently coercive. But in India, in addition to this much else is involved. With its caste system India has been quite a case by itself. There is a powerful in-built mechanism in it to

push people towards a status-ridden, hierarchic downgrading and through this process a systematic denial of respect to people in the lower orders of the caste system. Because of the scriptural sanctions that it enjoyed, it has been a self-validating system of authority and traditions associated with it. All this started breaking up, slowly in the beginning but gathering strength as time went by, with industrialisation and urban growth, increasing penetration of capitalist ways of accumulation of surplus in the countryside, subsumption of labour and all else which goes with the development of capitalism. This process of capitalist development has taken place within a framework of a more or less sustained working of democratic institutions and practices and intense electoral competition. This has given a specific flavour to the making of modernity in India.

Modernity may, as it is alleged, enforce normalisation – everybody made to live by the same standards and norms and of an origin which is not indigenous – but it is not conformist in any sense. Modernity allows for a great deal of autonomy of persons. It does so, first, by giving rise to an objective, historical process of individuation – making persons bound up within communities into (self-referring) individuals and by putting a high premium on individual choices for lifestyles and self re-making. It permits me to become different from my surroundings and to live at a certain distance from the communities out of which I may have emerged. It undermines those conditions which make life unfree. Democracy when it functions uninterruptedly in the context of such a change, facilitating and checking its excesses, has a loosening effect on the inherited social structures, which were always seen to be excessively oppressive, especially their hierarchical features based on notions of high and low in terms of purity and pollution. This is what seems to have been happening in India over the years of functioning of democracy. Rule of majority, whatever its limitations in India, recognises individual-level equality of vote even when other aspects of equality are regularly denied in practice.

Denials and affirmations are a complex amalgam here. As a dalit social being I may be denied access to village wells or an upper caste house. As a woman I may not be allowed to regulate my time or work. But as a citizen my vote, whatever my social status, is not worth any less than that of a brahmin or the patriarch. Or my evidence as a witness in a judicial process does not count as of any less weight. Even

very marginal increases in worth of people of low status is a challenge to those of an upper caste. For a brahmin to be told that the word of his village dalit is worth as much as his is a serious insult to his (false) sense of esteem as also an experience of pain inflicted on his self.

This disjunction between social existence and citizenship does, no doubt, lessen my functioning as a citizen but it does not negate it. In fact it opens up a terrain for struggles and however constrained my struggles, they are a means of enhancing my capacity to function as a citizen and to narrow the gap between this and my social existence. With this when people become conscious of group numerical strength, there also comes to them a greater sense of ability to move things in their own favour, a little here and a little there.

Democracy in India is therefore an assertion of the urge for more self-respect and to be better than what you were made out to be. This is a clear manifestation of the secular power of politics which is simultaneously the erosion of the self-validating nature of the power of the social structure and the traditions sustained by these. All this has conferred an added thrust to and taken forward the radical impulses generated through the powerful popular movements during the freedom struggle, in spite of the ruling classes acting as brakes on the process. Whatever the limitations, democracy in India has opened up the spaces for the great battle for egalitarianism. Let us look at this a little closely.

Indian society for ages had given an effective voice only to a small stratum made up of what are called the 'dwija' castes. It may have, perhaps, been overtly less repressive than other pre-modern class societies but its mechanisms of conformity were more elaborately ideological in nature and based on internalisation of direct scriptural sanctions than anywhere else. The voice of everyone else was taken away by this 'dwija' stratum headed by the brahmins. Democracy with all the struggles, agitations, mobilisations of all kinds, electoral participation and such other things broke the rigidity of the enforcement mechanisms of the social structure. The most lowly placed in the Indian society, the worst victims of this, could feel a little less suffocated; in a *minimal* way they could feel what it means to breathe the air of freedom, a perception as well of what all freedom can become.

Here we must be careful and not overread the situation. What the ordinary people have gained, given the conditions of their

social existence, is really very little. It is important to realise what is the limit on this freedom. It is exercised in a very narrow space. And this space becomes available by the traditional power becoming *loosely regulated and sporadic in its nature*. It has not broken down and therefore conditions which constrain the people from exerting their powers to enhance the realm of choices remain ever present. To put it in another way, it means that reprisals have become ad hoc in nature. Ordinary, poor people can go on doing things in their own way, contrary to inherited norms. But then at points unforeseen they may be hit at with varying severity. But then again they now can register an FIR with police and/or, more importantly, organise more people of their kind to fight back. This is the opening they really cherish. In defending the democratic (space) system it seems to be this little gain that they cannot think of being deprived of.

From the point made above, an important implication follows. The conditions of social existence being what they are, the inequalities within the society have, without becoming any less severe, changed, seen in a relative sense, their terrain in an important sense. What started people in their face and which took away their voice were the ritual-status inequalities. In their place have come to the fore the economic inequalities and with this those of power in the secular sphere. Inequalities of power in the secular world, unlike those of the ritual world, do not restrain the assertion of civic and political rights; in fact they encourage these and help bring together, as is happening all over the world, egalitarian values as integral to the democratic principle, for struggle and debate. It is in the very essence of economic and other secular inequalities to elicit a counter trend of fighting against this. And it is this which is the basis of all radical, including socialist, consciousness.

The loosening of the social structure and therefore the margins and spaces becoming available to the common people allow them to fight for dignity, rights and entitlements and to resist oppressive social custom to which the ordinary people, especially those belonging to lower castes, were systematically subjected. Precisely due to this they see democracy as an arrangement which permits a fight for a decent life in whatever minimal way they conceive it; given the social and material inheritance of the people this may well be felt by them as a large 'concession' won. In fact the very nature of caste and the relations of 'jatis' to 'varna' order itself

have undergone a drastic change. None of the lower castes – the dalits or the OBCs – any more are prepared to accept or act in the public sphere as lower category people. They do not any more accept that they are unpure and therefore polluting in nature.

This has come about with the emergence of new modern classes within the old caste order; crucial within this class formation is the making of a more or less numerous middle class, with literacy and skills in handling the secular world being the most important assets. And it is these strata who are waging a battle for equality on behalf of their communities.⁴ What is entailed in democracy is seen by them as a set of diverse resources. Hence a deeper commitment for democracy among these people. Confirmation of this comment and a deeper substantiation for the observation comes from another set of data. If we cross-examine the data on the growing acceptance of democracy and the institutions which surround it in terms of the weaker and vulnerable sections of society as against the relatively more privileged, we get some rather revealing sketches of preferences in relation to castes and communities. Let us therefore look at this data a little closely.

To do this, I only take for the present the changing nature of the electorate for some scrutiny. What we do here, to put it in another way, is to look for the inner composition of the aggregate of those who vote or do not vote; the emphasis though will be on those who vote. What strikes one immediately is the change in the composition of the electorate. This is important because the percentage of the electorate which votes has not changed in a pronounced way between 1971 and 1996 but the composition of those who vote or do not vote has changed in a dramatic manner. Compared to 1971 those who vote have, within the same overall percentage, got altered. There are more illiterates, rural-based people, scheduled castes and OBCs who comprise voters today than earlier. In 1971 there were more upper caste, urban, and college-educated voters than in 1996. Similarly, the percentage of Muslims or tribals who deviate from the national average is more pronouncedly towards voters than non-voters. Which means that the percentage figure converted from the sample to the overall electorate will add into millions of voters from these groups; in other words, these vulnerable sections of electorates make up more of actual voters now in 1996 than they did in 1971. We can therefore say with a fair degree of confidence that the democratic foundation to power today

is made up much more of the vulnerable sections than in 1971. The change in the composition of those who choose to vote out of the total electorate is rather unnoticed, when as so often happens we confine our attention to the surface observations. If we go behind what is hidden by the *aggregates* we get the startling fact that the fate of those who will rule within our parliamentary governance is now being determined, in an unexpected way, more and more by those who are weak and powerless and driven by need.⁵

Put differently, to say that the voting percentage in India has remained more or less the same hides more than it reveals. If fewer well-off people come out to vote than earlier and more poorer people decide to vote, then does this reveal anything significant about Indian democracy? If democracy has to solve problems in society then these concern more of those needs which pertain to the poor, viz., illiteracy, health, nutrition, housing, livelihood, etc. These same problems have got sorted out more or less satisfactorily vis-a-vis the well-off sections of society. We found earlier that the clue to Indian democracy surviving for half a century is not in the nature of problems solved or not but in the space that democracy provides for the vulnerable communities or sections⁶ to stand up and fight for their rights and entitlements. So let us pursue this story further and see what is specific to each of these.

In the analysis which follows I only take for consideration the communities which are vulnerable. This is for a simple reason. The exploited like the workers are uncomplicated in terms of opting to vote or not and cannot easily be prevented from voting. This is very unlike the case of certain communities whose fate in terms of choices is not the same across the communities nor is it uncomplicated. Oppressed communities in India are of two kinds in class terms. There are the *propertied oppressed* like many of the OBCs, though not all as many of them are in various handicrafts. The propertied oppressed were mainly, before the land reforms, dependent peasantry. Within these there is, obviously, bound to be class differentiation but we need not, at this point, go into this. There is then the *propertyless oppressed*. The most pronounced groups which make up this category are the dalits, being mainly landless agricultural labourers, but also in sizeable number in 'unclean' traditional work like that of various kinds of cleaning or leather work and so on. Among the propertyless are also the most backward

classes who are largely in 'clean' traditional occupations like barbers or washermen, and so on.

When we look at the changing composition of the voters we get an interesting picture. Let us look at this in relation to the castes, starting with the OBCs vs the upper castes. In 1996 over the average polling of 58 per cent, there were 1 per cent more OBCs voting as against nearly 2 per cent less of the upper castes; that is 59 per cent OBCs vote as against 56 per cent upper castes. It becomes more pronounced if we look at the scheduled castes who are 2 per cent above the average, that is, about 60 per cent of them vote as against 56 per cent upper castes. In 1971 the difference was not at all pronounced as it is now. Then both the OBCs and upper castes were 1.5 per cent below the average, but the scheduled castes were then only half a per cent above the average.

When we move, secondly, to the distinction in terms of education there is a more pronounced shift. Here we look at the illiterates vs educated (up to college level and above). In 1996 we have slightly less than half a per cent more illiterate vote above the average but what really comes as a surprise is that nearly 5 per cent fewer than average of those who are educated exercised their franchise; in other words, if 60.5 per cent of the illiterates are voters then only 55 per cent of the educated chose to go to the polling booth on election day. Here there is a rather drastic shift in the inner composition of the voters. The active portion of the electorate now is comprised of illiterates who obviously also are much more poor as against the college educated who more often also come from the better-off strata of our society. In 1971 there were slightly above 6 per cent educated above the average of 55 per cent as voters as against the illiterates who were 3.5 per cent below the average.

Here we then have a comparative puzzle which is also so from a commonsensical point of view. Comparative studies based on cross-polity surveys and other types of similar aggregate data have very clearly shown that the survival of democracy is negatively related to the persistence of illiteracy, poverty, oppression and related features. Furthermore, it is features of this kind that make a society prone to demagogic manipulations and populist manoeuvres. Not that India did not have a share of these. Radical populism followed up with some measures in the policy and administrative spheres has an undoubted place in all societies with socio-economic conditions like those of India. The euphoria

generated in 1971 in the wake of radical pronouncements but which soon dissipated in ruling class manipulation, as noted earlier, is a witness to that. But the Indian experience also very clearly shows that empty populism and radicalism which turns into empty rhetoric has been seen for the bluff that it is. The decisive rejection of the emergency regime by the ordinary Indian people is as emphatic a proof as one can ask for. Commonsensically too, as revealed in newspaper reporting, the apathy within Indian democracy happens to be with the sections who are illiterate, poor, etc. Let us for instance note that during every election during the last few years, news correspondents travelling across the country for reporting, repeatedly come up with the news that there is very little interest in the election campaign among the people. From this they often have inferred about voter apathy. Ordinary people do not, perhaps, talk politics as often and as coherently as we in our living rooms; or, at least, do not do so with us. What has not been realised is that there is much greater self-mobilising among these people than before. More of them are making up their minds about how to vote without being prodded.

Let us look at two more vulnerable groups or communities in a broad sense, viz, tribals and Muslims. This will further the substantiation of the assertion made above. In 1996 the aggregate vote of the various tribal communities is slightly less than 1 per cent below the national average. In 1971 it was below the average by 8.5 per cent. That is, on the average of 58 per cent it stands at 57 per cent in 1996 whereas in 1971 on the average of 55 per cent it stood at 48.5 per cent. This represents an enormous increase. In the case of Muslims it is exactly 1 per cent below the average whereas in 1971 it was 7 per cent below the average.

Now Muslims, unlike tribals, include non-vulnerable sections as well. There are landlords and professionals and a sizeable, though not quite as big as our impressions are, middle class among them. But it has been calculated by the data unit at the CSDS that the number of better-off section among the Muslims is no more than a third of their population and the rest of them are no better than the OBCs. Only among the dalits (19 per cent) and adivasis (16.4 per cent) is the proportion of better-off sections lower than among the Muslims. Clearly, the Muslims are not 'pampered' and have not gained excessively because of the appeasement policies of the 'pseudo secularists' when we compare them with the upper castes (the category here includes

the dominant castes such as the jats and reddy and so on among whom the number of better-off people is more than two-thirds of their population. So minus this small stratum the rest of them can be treated as vulnerable. They are vulnerable in another sense. Given the history of their role during the freedom struggle and varying degrees of identification with the separatist politics of the Muslim League they are a suspect presence in the eyes of a large number of people and this takes two forms: a non-hostile suspicion among a sizeable section of non-communal people and open hostility as by the hindutva forces and the like-minded. It leaves them as an aggregate of communities bewildered and insecure and this increases because the history of riots and their sociology are a gruesome aspect of Indian politics.

Let me end this story of numbers with another pair: the urban vs the rural population. Now it is not my contention that the rural is vulnerable and the urban is not. It will be an absurd position, though from Charan Singh on this too has been a refrain in Indian politics. The rural areas also contain a reservoir of the most reactionary ideologies in the presence of landlords who roughly constitute about 4-5 per cent of rural population and in addition to them there is a sizeable presence of kulkas and rich peasants. Likewise, the urban areas contain the most systematically exploited section like the working classes and also the run-away destitutes; all this and more. Nevertheless the urban areas also have the concentrated presence of the information and media networks and access to them is a source of potential power; there are the most powerful professional groups; and, above all, the most strong and stable section of the ruling classes, the bourgeoisie. All of this gives it a very pronounced advantage. This indeed is the reason for giving it consideration. Now as we look at this pair we find that the votes of those residing in rural areas are 1 per cent higher than the average, whereas in 1971 it was a little over 1 per cent lower. This is not a very significant shift as in case of some others we have considered above, but 1 per cent converted as absolute number given the size of the rural population is a huge number. But it acquires a significance when looked at in relation to the voters in urban areas. In 1996 the vote of the urban residents was lower by about 3.5 per cent but in 1971 it was higher by 4 per cent. So the overall decline in the proportion of urban voter is rather pronounced, suggesting the relative rise and fall of interest and apathy among the electorate.

What all this reveals is the infirmity of common sense and the untenability of facile comparisons; alternatively, we can say how deceptive are the surface looks of a phenomenon. When looked at closely appearances dissolve into questionable commentaries and what emerges as coherent pictures are the invisible underlying patterns. To note this is important to recognise who the democratic masses in India are. It is also important to call the pontificating bluff of the withdrawing elites who loudly blame the ordinary people for all the ills which no doubt inform the working of Indian democracy and the untidy manner in which the extension of democracy is taking place.

It is nobody's case that serious problems, almost a crisis, are not being encountered by Indian democracy especially in the working of democratic institutions and more particularly of governance as well. It is important to note in passing that the crisis of governance is due to, more than anything else, a sort of contradiction that has emerged between the 'principle of representation' and the 'requirement of parliamentary rule'. This has come about because the conditions determining representation are moving in directions in which the acquisition of majority by any political party is becoming difficult.¹ This has become in fact more pronounced with the slow erosion of the support of the Congress since the Emergency and after its sudden decline after the 1989 parliamentary elections. All this is due to the ineptitude of the 'governing class' which is largely made up of the established elites and those who are emerging from different hitherto excluded strata and are joining the established elites. The point to emphasise is that the danger to democracy comes not from the ordinary people but that the threat lies in the lack of skill of the emerging elites to properly run the democratic institutions and in their propensity to violate the rules of the game and to pay scant regard to the procedural aspects of democracy. More seriously the rise of Hindutva is also an effort on the part of the erstwhile dominant elites to regain the prominence they have been losing with the emergence of and ascendance to power of the middle classes from within the vulnerable communities.⁸

The predicament is precisely that which lies with the ruling classes and their political representatives. It is evident that ever since crises points emerged in Indian politics from the late 1960s the ruling establishment has shown a strong propensity to take recourse to authoritarian means for handling popular pressures; all this

culminated in the declaration of internal Emergency in 1976. One can therefore argue that democracy in India survives not despite the illiterate and poor people but due to their pressures for democratic governance. The elites in India have line-tuned the culture of evasion and repression. We see all the time efforts to solve people's problems through bureaucratic and technical means. It is only under intense pressure of popular movements and agitations that limited political recognition as agents is acknowledged vis-a-vis the people. It is this space that people want to protect and preserve. And it is this space which is under serious threat from Hindutva forces – the militant Hindu right-wing – emboldened to indulge in arm-twisting and illegal exactions on society.

Like with the exercise of vote, if we were to look at all the institutional aspects of democracy and popular orientations to these as well as their assessment of democracy in general, what comes as a revelation, no more unthinkable I hope after what has been disclosed above, is the fact of the much more widespread acceptance of these by the ordinary people than the better-off sections. But this is something I will not go into here, it has to be a story for another occasion. This acceptance furthermore is towards these as values and the processes by which these are being realised and which are affirmed irrespective of how these are made to function by the political elites, which is more often as we have seen viewed as a let-down. It is important to note this because an *inner agreement* is emerging among the oppressed about Indian democracy, whatever be their political fractiousness, which is in no way visible to us. It may be fragile and ad hoc but nevertheless an indication of its incipient strength. The fragility may largely be due to the weaknesses of the ordinary people who may or may not be able to beat back an assault launched by the ruling classes. Let us take the case of globalisation frantically under way now. People may know of its implications when they become victims of its consequences but they are not equipped either to its logic or to foresee the consequences. The ruling classes have the means and strength to push these through authoritarian methods. Nonetheless we will see that compared to any other section of society the ordinary and vulnerable are the ones who feel more strongly for democracy and its institutional set-up as well as the surrounding conditions.⁹

The central point underlying the picture that emerges from what we have seen through the data reported above and the

argument built around them can be stated as follows: the processes around democracy or the democratic process have detached themselves from the infirmities surrounding it, whether they be of the leaders or the parties or representatives, and acquired an autonomy of their own. The deepening legitimacy for democracy inheres here in the process – the struggles including electoral battles and their locales – and the process is the space which becomes available, now contracting and now expanding, for the range of resistance people are capable of. The invisible incremental advances and 'concessions' won are registered here. This happens in spite of the shape that organised politics has acquired. This also suggests that a radical revision of the theories of legitimacy together with how it comes about and where it resides, as elaborated in academic studies, is called for. The functioning of democracy in India has not provided an opportunity for a revolutionary advance. But it has given rise to a new kind of democratic progress, constrained no doubt by the hegemonic bourgeois condition. The question how do we overcome this condition remains the key question as it has been for quite some time.¹⁰

Notes

[This is not so much a continuation but a follow-up of my previous article 'Is Caste Appeal Casteism? Oppressed Castes in Politics', *EPW*, March 27, 1999. In that article I looked at what is constitutively happening to the various castes and its implications for social existence and political mobilisation as well as the reversal taking place within the 'varna' order and its implications for the nature of social mobility. Here I shift the focus and look at how the oppressed castes who, as has been argued earlier, are increasingly becoming 'communities', relate in complex ways to democracy in India.]

1 Consciousness, in the limited sense in which I am using it here, is what one draws or which gets unreflectively drawn from the experience plus stable ideological orientations where ideology itself is the sum total or framework of all our separate representations of the world we live in. Representations of all the things are never all the time right. So consciousness is never one like knowledge of reality which can also be validated in one way or another. Therefore, one facet of consciousness is always shifting because of the contradictory multiplicity of experiences people undergo and a good bit of it they may never sort out. But the other aspect of consciousness is more anchored, based as it is on the ideology people live by. This is important to keep in mind because in the course of this essay we will often use the word without specifying which side of it we are talking about.

2 All data are drawn from the CSDS data unit.

Data for 1996 based on a cross-polity survey conducted immediately after the parliamentary elections. The data for 1971 too are from a similar survey done then, a gap of 25 years which has seen momentous developments in Indian politics.

3 Legitimacy is something distinct from legality. It is always a flow of sentiments from below, from within the society, for practices or authorities or institutions whereas legal injunctions are directions from above, from the competent authorities, which then move down into society; even when those directions do not find acceptance they have to be obeyed. In other words, there is always a degree of compulsion inbuilt in legality. Legitimacy is, to the contrary, an active and willing endorsement of something as desirable. For example, practice of untouchability or asking for dowry does not enjoy any legality; these are banned practices. Yet these are widely prevalent across classes and communities. For legal injunctions to become legitimate these must come to be seen as desirable or morally binding by society as such in terms of its own volition. There can always be a disjunction between legality and legitimacy in any society but it is generally more pronounced where a change is sought in the values and outlook of the people, as is happening in our society.

4 For a detailed elaboration of the logic of this development see my, 'Is Caste Appeal Casteism?' op cit.

5 The voting figures in India stabilised from the time of the third general elections in 1962. These have randomly fluctuated between 55 per cent and 62 per cent in most of the elections except in 1991 when these went down to 51 per cent and, in the opposite direction, these rose up to 64 per cent in 1984. But otherwise the range holds over seven parliamentary elections. At the two points at which we are making comparisons the voting figure in 1971 was 55.3 per cent and in 1996 it was 57.9. This is not an insignificant difference but it is not too dramatic either to vitiate comparisons.

6 The vulnerable sections in India comprise those who are exploited and socially oppressed. These ought to be treated as distinct because one who is exploited, say, an upper caste worker, is not socially oppressed but a middle peasant belonging to OBC is not exploited but the expression of the social order in India is such that historically OBCs have been oppressed. In many instances, say, in the case of the harijan/dalit agricultural worker, he is both exploited and oppressed at the same time. Women belonging to well-off sections are an instance of those who are socially oppressed but who may also be the exploiters as well as oppressors of the labour and person of the poorer strata.

7 See my 'Is Caste Appeal Casteism?...', op cit. In addition to the reasons advanced there, there is also the fact of a shift in the basis of allegiance and mobilisation towards the various regions of India which are in the process of redefining the Indian nation in new terms.

8 See my 'Is Caste Appeal Casteism?...', op cit. for details of this process.

9 Here it may be interesting to look at the estimation of the future by the people which is a source of an insight as well as a confirmation of the assertion that the development of capitalism in India within a functioning democracy has opened up spaces for struggle against the stranglehold of inherited social structure. Asked if their children would have better opportunities in life than

they had over 54 per cent considered the prospects for children as better and only 22 per cent felt that they would not have better opportunities.

10 As a political statement in the given conjuncture one may be able to say: Defeating Vajpayee is the first step. Sidelining Sonia Gandhi after that is the next. Building a relatively stable Third Front is the third. After that the shape of popular struggles will determine our future.

Overseas Post-Doctoral Research Fellowships in Environmental Economics Under the World Bank Aided

India Capacity Building Project

Applications are invited from suitable candidates for being considered for the award of overseas post-doctoral research fellowship in environmental economics (maximum duration of 9 months). These fellowships are tenable at prominent foreign universities or environmental economics/economics research institutions and are intended to strengthen research and teaching capabilities in India in environmental economics and provide opportunities for Indian scholars to improve their skills in this area through course work.

Indian citizens holding permanent positions in Indian universities, colleges or research institutions, with a Ph.D. in economics and below 45 years of age as on October 22, 1999, are eligible for these research fellowships. Members currently serving or who have served the Expert Committee on environmental economics or members of the sub-committees, constituted under this programme are not eligible. Preference will be given to candidates who are teaching in an university or a college and have taken courses in environmental economics at the post-graduate level/have done teaching or research in that area. Preference will be given to candidates other than those who fall in the fellowship categories:

- (i) those who have obtained a Ph.D. degree in Environmental Economics from overseas university;
- (ii) who have been abroad on a similar fellowship;
- (iii) who in the opinion of the Committee have acquired adequate capacity in the area of environmental economics by attending courses, teaching, conducting research and working in this area overseas.

During the tenure of the fellowship, the selected candidates will be expected to take courses in environmental economics and do research on a specified topic. Proposals of both empirical and theoretical research in environmental economics will be considered. Selected candidates are expected to devote full time to training and research. No candidate would be allowed to take employment during the tenure of fellowship. The fellowship will be administered by the Environmental Economics Overseas Fellowship Committee (EEOFC) constituted under the World Bank aided India Capacity Building Project – Environmental Economics Component. For an application form, please write to the Member Secretary, EEOFC at the address below stating date of birth; present position and date of Ph.D. award.

* Last Dates

- * For requesting for application forms: 25-09-1999

Agricultural Tenancy and Interlinked Transactions – I

Neoclassical and Marxist Approaches

Mamata Swain

This article attempts to study features of tenancy and interlinked transactions in Orissa in recent years. The applicability of the neoclassical and Marxist approaches to the study of interlinked factor markets is examined with empirical data collected from three villages through an intensive survey. It is argued that the Marxist approach is more powerful in studying interlinkage as it addresses the problem in the context of a differentiated class society. However, the autonomous role of class relations should not be overstressed. The macro variables that shape class relations and the enforcement device of the dominant class are to be given due recognition.

This article appears in two parts. This, the first part, analyses features of tenancy prevailing in the survey area and explores causes for the existence of tenancy and its persistence.

IN underdeveloped agrarian economies it is very often observed that transactions in rural markets are intertwined in a significant way in the sense that a transaction in one market becomes contingent upon a transaction in another market. A landlord and his tenant enter into several transactions at the same time; in leasing out land, in hiring labour, in providing credit, in sharing of input costs, in marketing of output, etc., all as part of a comprehensive interlinked contract encompassing several markets [Bardhan 1980]. Thus interlinkage of factor markets is said to take place when contracts regarding several interdependent market transactions are simultaneously agreed upon between the same parties.

I

Neoclassical and Marxist Approaches to Interlinkage

There is a plethora of literature on interlinked land, labour and credit transactions most of which try to explore the causes of interlinkage and delineate its consequences on farm economy. However, the different views on interlinked deals can broadly be divided into two strands of thought, the neoclassical and the Marxist.

The neoclassicals argue that rural factor markets are imperfect, characterised by prevalence of risk, uncertainty, indivisibility, information asymmetry and moral hazard problems. They emphasise that interlinkage is the means by which the profit maximising landowner overcomes the inefficiencies of incomplete and imperfect markets and this facilitates increased efficiency and higher social welfare.¹

The most plausible explanation put forward by the neoclassicals for the existence of interlinked deals is that it

minimises transaction cost and ensures insurance against risk and moral hazard in a world of uncertainty and information asymmetry. It is stressed that interlinked rental and credit contracts may be a device to internalise externalities generated by moral hazard considerations when production uncertainty and information asymmetries between agents prevail – as in the case when it is difficult for the landlord to monitor if the tenant's low output is the result of inadequate effort or bad luck [Braverman and Stiglitz 1982; Braverman and Srinivasan 1981]. The landowner provides a consumption loan to the tenant to induce him to work harder, advances production loans to enable the tenant to adopt improved package of practices and shares in cost to increase the intensity of input use, all aimed at getting increased yield [Braverman and Stiglitz 1982]. Thus interlinking of land, labour and credit markets can be regarded as an attempt to improve allocative efficiency by reducing transaction cost in the face of risk and moral hazard in the absence of any insurance market. This is precisely what the neoclassicals argue for the existence of interlinked deals.

Marxists, however, believe that interlinked transactions are devices of the dominant party to subjugate the poor and to increase their political economic power in the village community. Interlinkage is viewed as a method of surplus extraction which helps the dominant class consolidate their class position. The various instruments that are interpreted in the neoclassical analysis as increasing the efficiency of sharecropping as noted in the preceding paragraph are deemed in the Marxist formulation as weapons for im-

proving the effectiveness of surplus extraction.²

The differences between the neoclassical and the Marxist viewpoints on interlinked transactions can be summarised as follows: (i) Neoclassicals presume that interlinked transactions are an individual's rational response to market imperfections aimed at improving allocative efficiency. Marxists argue that interlinkage symbolises class relations and is a mechanism of surplus extraction. (ii) Neoclassicals argue that interlinked deals are welfare promoting devices from the points of view of both the landowner and the tenants and it represents a symbiotic relationship where both parties benefit. Marxists hold the view that the purported increase in income is cumulatively appropriated by the dominant class and the incomes of the tenants are pushed back to their bare survival level needed for their reproduction only. (iii) Neoclassicals stress that the tenants enter into interlinked transactions voluntarily as it increases their welfare. Marxists, however, believe that interlinkage is nothing but a survival strategy for the weaker sections and it is a compulsive involvement in market transactions to meet their subsistence needs.

Thus the neoclassical interpretation of interlinked transactions is contractual, while the Marxist explanation is one of surplus appropriation. One notes of the Marxist approach that it lacks a macro framework which needs to take into account the macro variables that create favourable conditions for the landowning class. The contingencies upon which the Marxist superstructure is to be built need to be pointed out. More accurately, the macro variables which create an advantageous situation for the landowning

ENVIRONMENTAL ECONOMICS PROGRAMME

**(World Bank Aided India: Environmental Management
Capacity Building Technical Assistance Project)**

Implementing Agency: Ministry of Environment and Forests, New Delhi

Executing Agency: Madras School of Economics, Chennai

Applications are invited from Ph.D. scholars working in the field of Environmental Economics for participation in a Three Day Workshop on Environmental Economics to be held at Madras School of Economics, Chennai during November 15-17, 1999. Interested candidates may send their applications through their Ph.D. guides giving information about the title of the thesis, date of registration, name of the institution awarding the degree, names of guide and co-guide and the current status of the thesis along with a paper containing objectives of the study, review of the literature, methodology chosen, database used and preliminary theoretical/empirical results. As the Workshop is likely to be held every year till 2002, preference will be given to candidates who have made substantial progress in the thesis so that they can benefit from interaction with the experts. Madras School of Economics will reimburse first class railway-fare both ways by the shortest route and also meet the local hospitality expenses.

Please send your application along with the paper to the Coordinator, Environmental Economics Programme, Madras School of Economics, Behind Govt. Data Centre, Gandhi Mandapam Road, Chennai 600 025 [Fax: 235 2155; email: msepu@md3.vsnl.net.in or sethuwb@hotmail.com] on or **before October 15, 1999.**

Women in Security, Conflict Management and Peace (WISCOMP)

is a new initiative committed to promoting an alternative, gender sensitive discourse on a range of issues related to peace and security. Planned as a South Asian programme, WISCOMP in its first year invites applications from Indian professionals and scholars under the age of 45* for its **Scholar of Peace Fellowships**. Awarded annually, the Fellowships cover a period ranging from three months to one year. Candidates interested in conducting high quality academic research, media projects or special, innovative project may seek further information from:

*Age limit may be relaxed in exceptional cases.

in the year 1991-92 the percentage of operational area under tenancy in Orissa was only 9.5 per cent and tenant holdings constituted 16.4 per cent of total operational holdings.

High incidence of tenancy in the non-irrigated village Sandhagaon can be attributed to various reasons. In dry land farming practised in this village, crop yield and cropping intensity are found to be quite low. Cultivation is viewed as a losing concern. Moreover, wage rate is higher in this village. Due to existence of many industrial complexes in its vicinity, casual labourers demand high wage in parity with the available industrial wage. Low yield along with high wage and high cost of cultivation induces landowners who have other sources of income like salary and business to lease out their land. On the demand side, in the absence of adequate employment opportunities the agricultural labourers are keen to lease in land to produce some food crops which they can retain as food security against the lean period.

If we analyse the incidence of share tenancy over time in our study villages, in Charapara and Harinababi most of the tenants reported that share tenancy is tending to increase due to emigration of landowners to urban areas for employment. But in the non-irrigated village no such trend is perceptible.

It is usually believed that land attracts land: that landlords prefer to lease out land to landowning peasants as they are considered to be efficient cultivators having managerial experience in farming [Nadkarni 1976:A142; Sarma and Dreze 1990:58; Chadha and Bhaumik 1992:1010; Gill 1989:A82]. On the other hand, some empirical findings suggest that the big lessors prefer to rent land to landless tenants with large family size (dependency burden) and preferably in small parcels [Bharadwaj and Das 1975]. It is argued that under the burden of survival the landless poor will exert more effort to get an increased yield to meet the subsistence needs of the family. This is interpreted as a strategy of extracting labour rent from the sharecroppers in a hidden and subtle manner.

Our findings with regard to the incidence of pure and part tenancy are presented in Table 5. In the advanced village Charapara 56 per cent of tenant households are pure tenants and they operate about 60 per cent of tenanted area. Thus incidence of pure tenancy is higher than part tenancy. But in the backward village Sandhagaon pure tenants constituting 60 per cent of total tenants account for 31 per cent of tenanted area. In the case of Harinababi this question does not arise as there are no landless

households in Harinababi. In Sandhagaon the resident higher caste lessors prefer to lease out their land to their relatives rather than leasing out to landless scheduled castes. In this village there is some sort of caste conflict between the higher caste landowners and the scheduled castes, whereas in the irrigated village Charapara there is good understanding between the two classes. It is not the caste consideration but managerial ability and honesty in paying rent that are the criteria to screen the tenants. Managerial ability is gauged by a number of factors: experience in cultivation, number of able-bodied adult male members in the family and past yield performance of the tenants.

However, in Charapara, leasing out of land to landless labourers is a comparatively recent phenomenon. The supply of tenanted land has increased due to

emigration of landowners to urban areas for employment. Moreover, the owner cultivators of the village are disenchanted with cultivation and are not willing to lease in land. Sharecropping on hired labour basis is not at all an attractive proposition for the landowning class due to problems of labour availability and labour supervision. On the other hand, the standard of living of the landless agricultural labourers has improved because of implementation of various government poverty alleviation programmes. The financial position of the landless labourer families has improved and they are able to incur cultivation expenses and possess their own bullocks. They are interested in leasing in land and cultivating with their own family labour. A detailed distribution of cultivating households according to tenancy status is given in Table 6.

IV Reasons for Leasing

We now attempt to analyse the characteristics of tenants and the causes for leasing in land. The decision to enter into a tenancy contract can mainly be triggered by two types of motives. Firstly, the objective may be to earn subsistence as no alternative job opportunity is available. In this case, it is a compulsive and involuntary participation in the transaction because the returns from tenanted land are hardly commensurate with the effort that the tenant puts in due to high rent. The poor peasant most unwillingly enters into the production relations of share tenancy as there is no option for him other than sitting idle and semi-starved at home. Secondly, leasing-in may be undertaken to increase the scale of operation due to indivisibility of factors of production to earn commercial profit. Here the contract is voluntary and promotes allocative efficiency. This type of tenancy is called capitalist or commercial tenancy. In the first case tenancy is a survival strategy whereas in the second case it is a welfare promoting device.

In backward agriculture 'subsistence leasing' by poor peasants on sharecropping basis is mostly observed as a survival strategy. By contrast, in agriculturally progressive areas 'commercial leasing' by rich peasants on fixed rent basis is prominent. Several empirical studies reveal that in developed areas, large farmers are found to lease in whereas small farmers tend to lease out [Bharadwaj and Das 1975, Nadkarni 1976:A41; Singh 1989:A88; Vyas 1970; Srivastava 1989:358]. The entrepreneurial large farmers rent in land primarily to cultivate large tracts of land in a compact block on commercial lines by using tractor and installing pumpsets for irrigation. The small farmers lease out because there is security of wage earnings in advanced agriculture due to high demand for labour. They prefer wage income which is certain in advanced areas to uncertain crop income from leased-in land. This sort of leasing-in by large farmers is termed reverse tenancy [Singh 1989] or capitalist tenancy [Parthasarathy 1991]. But large farmers are found to rent land on fixed crop or fixed cash basis rather than on crop share [Vyas 1970:A-78, Bhalla 1983:837].

Our study villages are located in the agriculturally backward region of eastern India where mechanisation is as yet in its infancy. There are mainly small lessees and also small lessors found in our study villages. This finding supports Ray's (1978) evidence from West Bengal.

Table 3 shows that mostly the landless, marginal farmers and small farmers are leasing in land. The average owned holding of an owner tenant is 2.32 acres in Charapara, 4.4 acres in Harinababi and 2.83 acres in Sandhagaon. The average owned holding of a tenant owner is much smaller, only 1.96 acres in Charapara, 0.96 acres in Harinababi and 0.48 acres in Sandhagaon.

On inquiring about the causes for leasing in, in Charapara all the tenants reported that lack of alternative job opportunity compels them to lease in land (Table 7). In Harinababi 60 per cent of the tenants and in Sandhagaon 80 per cent reported 'no alternative job opportunity' as the reason. In Harinababi 20 per cent each reported the reason for leasing in as 'to consolidate holding' and 'to increase operational holding' and in Sandhagaon 20 per cent of the households reported 'bullock adjustment' as the reason for leasing-in.

The landless casual labourers do not get work throughout the year and it is found that households with large family size are interested to lease-in land as they can cultivate the land with family labour. If they produce some crop by leasing in land, they have an insurance against hunger for the rest of the year. Also, small farmers belonging to higher castes lease in land. Because of their caste status they hesitate to hire out labour and work in another man's field. That is why they lease in land as no other employment opportunities are available.

Thus, it emerges clearly that most of the tenants (84 per cent) are renting land because there are no alternative employment opportunities for them. It is a compulsive involvement in the transaction and supports the Marxist view. We need to explore whether the compulsion is economic, i.e. due to certain macro features of the economy, or non-economic characterised by extra-economic coercion. Our study reveals that the share tenants are under no bondage or compulsion to lease in land from a particular lessor. They are quite free to take their own decisions on how much land area to lease in and from whom. The lessees are completely free to rent land from more than one lessor. No tenant reported doing unpaid labour services for the lessor and when they work for the lessor they are usually properly paid. But it is observed that tenants do sometimes borrow from the lessors and that they repay in labour. They are usually paid at a lower wage rate than the prevailing market rate, which is, of course, equivalent to charging an implicit interest rate. Thus,

our survey evidence negates the presence of any sort of extra-economic coercion, but suggests some interlinking of markets.

Absence of coercion, of course, does not mean absence of exploitation. The mode of exploitation changes with changes in productive forces and there may be hidden strategies to extract surplus. The compulsions are more due to the macro features of the economy at large rather than due to exercise of power of landlord class over the poor peasants within a village boundary. Due to the slow pace of industrialisation, the land-poor peasants find it difficult to get alternative jobs in the non-farm sector. Therefore, they are leasing in land even if it is hardly remunerative. By leasing in land, they become subordinate to the landowning class and subject to all sorts of surplus extraction through high rents, low wages and interlinking transactions with labour, credit and output markets. In the villages under study sharecropping can clearly be seen as a method of surplus appropriation (discussed in subsequent sections) as the aim of the landowner is not to improve allocative efficiency but to appropriate surplus after paying the labour just enough for his reproduction.

The next important question is why sharecropping is the predominant form of tenancy contract rather than fixed cash or fixed kind rent. The most plausible explanation is that due to their precarious existence at the margin of subsistence, tenants are not in a position to take the risk of a fixed payment contract. An important aspect of sharecropping is the reason why a sharecropper leases in land? Does it pay? To address this we have calculated net farm income from an acre of gross cropped area of tenanted land of part tenants. The net farm income has been arrived at by subtracting the rent payment from net income and adding to it the imputed value of own labour. The findings are presented in Table 8. It is clear from the table that in the case of part tenants, tenancy is nothing but a labour adjustment process as imputed value of own labour constitutes a significant proportion of farm income and in some cases the net receipt after payment of rent is negative and shows positive profit only when we add imputed value of own labour to the net receipt. In the non-irrigated village the landless pure tenants reported that leasing-in is not at all paying whereas the pure tenants in Charapara reported that because of the landowning class they are able to survive by renting land.

Thus, tenants are leasing in land most unwillingly as no other job opportunities

are available. From this fact, it can be discerned that if alternative job opportunities were available to the land-poor section of the peasantry in the non-farm sector through industrialisation, sharecropping would tend to disappear. The crux of the problem here is not that class relation (as emphasised by the Marxists) compels the rural poor to interlink transactions, as that the operation of certain macro features like population pressure on limited land, tardy industrialisation, lack of employment opportunity cause the persistence of sharecropping. We suggest that the autonomous role of production relations, or agrarian structure, should not be overstressed.

In our study villages most of the lessors are small lessors, i.e., MFs and SFs as shown in Table 3. In the irrigated villages all the lessors are MFs and SFs whereas in Sandhagaon there are two MDF lessors. The average holding of pure lessors is 2.03 acres in Charapara, 1.4 acres in Harinababi and 2.98 acres in Sandhagaon. Table 10 shows that in Charapara there are three owner cultivators belonging to the MDF and LF categories who have also leased out a part of their land because it is distant or problematic. In Sandhagaon a scheduled caste landowner has also leased out all of his land because he has salary income.

In the irrigated villages most of the lessors are semi-absentee landlords (Table 9). It is observed that most of the lessors have migrated to urban areas mostly to Calcutta and are employed there invariably in unskilled and semi-skilled jobs. But their family members stay in the village. They come to the village every two or three months to see their family members. But in Sandhagaon there are also resident lessors. As they have other sources of income, they prefer leasing out to self-cultivation.

Reasons for leasing out are listed in Table 10. In Charapara out of nine pure lessor households four PLs reported that as there are no able adult male members in the family to supervise cultivation due to the migration of the head of the household to urban area for employment, they are leasing out land. The OCs who have leased out part of their land reported that as the land is situated at a distant place they prefer to lease out. One LF in Charapara reported that as the land is problematic due to too much weed growth, he leased it out. The hidden intention is to take it up for self-cultivation after a few years when weed growth will be lessened. Moreover, it is found that the owner cultivators prefer to lease out only non-irrigated and problematic land. In

Harinababi out of three pure lessors two reported lack of sufficient manpower due to migration of family members as the cause of leasing out. In Sandhagaon, three out of six PLs responded that they did not have bullock power to cultivate land and that is why they had to lease out. Thus, non-possession of bullocks also compels the lessors to lease out.

When we asked the tenants the reasons for their lessors' leasing out land, most of them also reported that their lessors did

not have able-bodied adults residing in the village to supervise cultivation due to emigration of family members.

It is to be noted that though there are pure lessors the pure rentier class is quite absent. We find that in Charapara only 13 per cent of the income of PLs is rent income and it is 8 per cent in Harinababi and 11 per cent in Sandhagaon. Again in Charapara a major proportion of PLs' income is from remittances (46 per cent). In Harinababi also remittances constitute

Ask the tenant for unpaid labour service	1	-	-	1
Total	10	5	13	28

reported that the landowner sometimes asks for unpaid labour services and if the tenant does not agree to this, he is evicted. Even a casual labourer cited this reason for his eviction a few years back.

In the non-irrigated village Sandhagaon two tenants reported 'fear of tenancy legislation' as the cause of eviction and some reported 'to lease out to another favourable tenant'. One tenant reported that he had leased in 3 acres of land and had been cultivating it for the last 20 years but that the lessor asked for a loan of Rs 10,000 by keeping the land as mortgage. As he (the tenant) could not advance that loan, he was evicted. In this type of mortgaging the arrangement is that when the landowner repays the loan the land will be returned to him. Until that period the lender cultivates that land and retains the crop produce as interest. In the irrigated villages the frequency of eviction of tenants is on the increase whereas it has remained the same in the non-irrigated village as reported by the tenants. But eviction of tenant for the purpose of resumption of land for self-cultivation is rare.

VI Conclusion

We attempt to summarise our findings to examine them against the viewpoints set out at the beginning. Our findings give some support to certain of the Marxist propositions on share tenancy.

Firstly, share tenancy is found to be a compulsive involvement in market transaction from the point of view of both the lessee and the lessors. In regard to the causes of share tenancy the main reason for leasing-in as reported by the share tenants is 'lack of alternative employment opportunity'. The prime reason for leasing out as expressed by the lessors is 'no able adult male in the family to supervise' due to migration of family head to urban areas for employment. Thus, tenancy considered from the viewpoint of both lessees and lessors is a compulsive contractual choice arising from certain social contingencies.

Secondly, share tenancy is seen to be a method of surplus appropriation rather than a mechanism to increase allocative efficiency. Illegal unrecorded tenancy, high rent, absence of input cost sharing, shortening of leases, eviction of tenants due to dissatisfaction with tenant's yield and high rent are distinguishing features of share tenancy as observed in the study villages. If minimisation of transaction or supervision cost is the primary motive to lease out, then the resident cultivators are expected to lease out instead of cultivating

their land themselves. But no such leasing out by resident large farmers is observed in the study villages.

Our analysis shows that the Marxist approach, though more appropriate in explaining share tenancy than the neo-classical approach, is not sufficient and needs to be supplemented by an overarching macro framework so that the persistence of tenancy can be adequately explained. Factors like population growth, adverse land-man ratio, tardy industrialisation, unemployment and regional disparity account for existence of tenancy.

Moreover, the historical development of the areas is to be considered. It is important to know how the landless class was created and why there is no industrialisation or transfer of surplus labour to the non-farm sector and also why agriculture remains overcrowded and land-man ratio is adverse and getting worse. Thus a particular production relation does not begin on a clean slate, the historical antecedents and the role of the state play a dominant role in structuring a production relation.

But, we stress that we do not find in our village a pure rentier class, or a class of large landlords renting out land to a subject peasantry. This particular Marxist view is clearly not supported. Nor can the Marxist approach, as exemplified by, say Pearce (1983) be supported. The role of certain situational contingencies, of certain macro features and the role of migration need analytical attention of a kind that Marxist treatment has tended not to give.

Notes

[This paper is based on the author's PhD thesis, Department of Economics, School of Oriental and African Studies, University of London, 1993. The author is grateful to her supervisor T J Byres for his comments at various stages.]

1 For neoclassical viewpoint on share tenancy see in particular Cheung (1969), Bardhan (1980), Braverman and Srinivasan (1981), Braverman and Stiglitz (1982), Mazumdar (1975), Reid (1974, 1976), Basu (1983). A concise summary of neoclassical theories on tenancy is given by Quibria and Rashid (1984).

Also exponents of agricultural ladder hypothesis like Robertson (1987) with data from sub-Saharan Africa and Winters (1978) citing evidence from 19th century Iowa argue that migrant labourers and newly married couples lease in land to earn their livelihood as a means of getting on to the bottom rung of the farming ladder. In this context share tenancy is viewed as a co-operative endeavour on the part of the tenant and the landowner in co-joining their factors of production which leads to an efficient outcome.

2 For Marxist interpretation of tenancy and interlinkage see Bharadwaj (1974, 1985),

Bhaduri (1973, 1977, 1983a, 1983b), Pearce (1983) and Prasad (1973, 1974). The agricultural ladder hypothesis put forward by Robertson (1987), Lehman (1985), Winters (1978) is to some extent akin to the Chayanovian view of agrarian relations which has been criticised by the adherent of Marxist line of thinking [Patnaik 1979].

3 Categorisation of Farmers:

Owner cultivator (OC) cultivates his owned land only.

Part tenant (PRT) cultivates his owned land as well as leased-in land. An owner tenant (OT) is a part tenant half or more than half of whose operational holding is owned land. Thus an owner tenant is more of an owner than that of a tenant. The reverse is the tenant owner (TO) who is more of a tenant than that of an owner and more than half of his operational holding is leased-in land.

Pure lessor (PL) leases out all of his owned land and his operational holding is nil.

Pure tenant (PT) is the landless tenant who does not have cultivable land of his own.

Landless casual labourer (LCL) does not have any owned land and he hires out labour to earn his livelihood.

Attached labourer (AL) is attached to a particular employer and works for him. Usually he is provided with homestead land or land for cultivation by the employer. But he has the freedom to work for other employers when his employer does not have enough work for him. He is semi-attached to that extent. And he is paid wages for the days he works for the employer.

Farm servant (FS) is a fully attached labourer who is paid annually or monthly. And he does not have the freedom to work for other employers during the period of the contract. He is given food and clothings by the employer.

Others include the government job holder, pensioner and single widow family.

	Land Holding (Hectare)	
	Unirrigated	Irrigated
Marginal farmer (MF)	1	0.5
Small farmer (SM)	1-2	0.5-1
Medium farmer (MDF)	2-4	1-2
Large farmer (LF)	≥4	≥2

4 In Bhalla's 'pipeline theory' in the first instance non-cultivating village residents, or absentee landlords, whose main income is derived from a non-farm occupation lease out land. But as time passes these lessors lose interest in land, lose contact with the village and ultimately sell their land.

5 See Newbery (1975b:117-18) for a critique of Rao's arguments.

Tribals, Missionaries and Sadhus

Understanding Violence in the Dangs

Satyakam Joshi

The tribals of the Dangs, Gujarat, had suffered exploitation by local elites and outsiders for over a century. When educated Dangis began to fight back, their first target was the corrupt Congress organisation. The issues were rights over natural resources, land titles, poverty and unemployment. Conversions to Christianity had led to minor skirmishes but no worse. Hindutva organisations stepped in at this point, relegated the real issues to the background, sowed paranoia and reaped votes.

ON Christmas day 1998 a big rally was held at Ahwa, the district headquarters of the Dangs district of Gujarat, to protest about an alleged wave of conversions of local adivasis (tribals) to Christianity. That evening and over the following days there was a series of attacks on Christian churches and schools in different parts of the district. Within a week, 36 churches and prayer-halls had been burnt. Though the chief minister of Gujarat, Keshubhai Patel of the Bharatiya Janata Party (BJP), sought to dismiss these attacks as insignificant, they attracted nationwide and international attention. The prime minister, Atal Behari Vajpayee, and the leader of the opposition, Sonia Gandhi, both visited the Dangs, as well as reporters from foreign newspapers (*India Today*, January 25, 1999; *Guardian*, January 20, 1999).

These attacks were paralleled by similar violence against Christians in other parts of India in late 1998. As in other cases, the chief instigators appeared to be from the bodies associated with the Hindu Right, namely, the Rashtriya Svayam Sevak Sangh (RSS), Vishwa Hindu Parishad (VHP), the irregular wing of the latter, the Bajrang Dal (BD), and the Hindu Jagran Manch (HJM). Together with the BJP these are often described as the Sangh parivar. The VHP leader, Ashok Singhal, went so far as to justify the aggression on the grounds that Hinduism was in danger from 'Christian conspiracies' (*India Today*, January 11, 1999). Whatever the instigation, however, the actual attacks were carried out in the Dangs by one group of local adivasis on another. This paper seeks to show how this situation came to arise.

We shall start by examining the socioeconomic issues which have given rise to tensions in the Dangs in the past few years, and then go on to examine the issues of community solidarity, the Christian conversions which are supposed to have fractured this solidarity, the Hindu backlash, and the emergence of a new adivasi leadership in the Dangs allied with the BJP. In

March 1999, I travelled to the district to conduct interviews with people of the Dangs as well as outside religious figures, and I shall close the article with these interviews and my comments on them.

I Background

Situated in south-west Gujarat on the border with Maharashtra, the 1,764 sq km district of Dangs is almost completely covered by forest, being one of two districts in the country having over 90 per cent forest cover. Ninety-four per cent of the inhabitants, living in 309 villages, are classed as scheduled tribes. Of this 40 per cent are kunbis or kuknas, 33 per cent are bhils, and 14 per cent are varlis. Kuknas appear to have migrated to the area around the 14th century from the coastal region of Konkan (Maharashtra). During the pre-colonial period, the Dangs was ruled by several bhil chiefs, who had ties with neighbouring rulers of Gujarat and Maharashtra. Formerly, no powers from the plains had achieved military success in the Dangs, because of its dense forest and malarial climate. However, the British subjugated the bhil chiefs in 1830, subsequently allowing them to continue as independent rulers under the paramountcy of the colonial state. During the 1840s they forced the chiefs to give them the right of timber extraction in the tract, in return for which the chiefs were given an annual stipend. The British sought to exploit the teak wood which was considered exceptionally good for building warships, railway sleepers and for other purposes [Hardiman 1994].

The British exploited the forests extensively for timber. About a half of the area was classified as reserved forest, and the local people were not allowed to cultivate, collect wood, or graze their cattle within these reserves. Over half of the villages were within the reserved areas; the tribal inhabitants were forcibly evacuated and

resettled in the remaining villages. Due to this the Dangis were forced to change their traditional methods of shifting agriculture and cultivate on the same plot year after year. In time, this caused serious environmental degradation. This also gave rise to conflict between the bhils and the kuknas, as the latter proved to be more adaptable to the new situation, and were able to consolidate their power over and against their erstwhile rulers. This led to resentment by the bhils and tensions. This is an important point, as it shows that the adivasis of the Dangs were not homogeneous [Skaria 1999:115-20].

When India won independence in 1947, the bhil chiefs ceased to be rulers and the Dangs came under the governance of Bombay state. The post-independence forest department continued with the same policies. There was however one important change, for political activists and non-governmental social workers were now allowed entry into the Dangs. Previously, the British had banned all such people from the area, due to their association with the nationalist movement (Christian missionaries were the one exception to this rule). A Gandhian ashram was established at the district headquarters town of Ahwa by the brothers Chhotubhai and Ghelubhai Nayak in 1948. In the first two months after the establishment of the ashram at Ahwa, Chhotubhai received 1,700 complaints from Dangis against atrocities committed on them by the forest department. To counter this, the Gandhians persuaded the Bombay government to allow forest cutting to be organised and controlled by labour co-operatives which were under their control. The government agreed, and labour conditions soon improved considerably [Joshi 1992:413-19].

The forest labour co-operatives provided a strong power-base for the Gandhian workers, allowing them to consolidate their power in the tract. Chhotubhai Nayak became the first popularly-elected president of the Dangs district panchayat in

1958. In 1968, after a decade of power, some rivals within the south Gujarat Congress Party decided to challenge him by encouraging some young kuknas to establish rival co-operatives, using these as a power-base to challenge for control over the district panchayat. This was achieved in 1970, when Ranju Thakare, a kukna of Sarva village, was elected as president. Thakare was to continue in power up to 1995. He and his followers extended their control over the co-operatives formerly dominated by the Gandhians, and founded new ones of their own. Using their new powers, they began to enrich themselves at the expense of the majority of the population. They bought land, built lavish houses and acquired personal jeeps. Increasingly, forest labour could be obtained only through bribes. As many said to me when I was carrying out research in the Dangs in the late 1980s: 'Our sons are cheating us' [Joshi 1992:435-59].

It was in their interest to extend the area classified as government forest as much as possible so as to increase their power and income. In this, they worked with the forest department. When previously cultivated land was left fallow in a particular year, the forest officials quickly reclassified it as forest department land and planted it with saplings. They could get away with this as much of the cultivation continued to be shifting, and land title rights were not yet clearly established. The officials claimed that the land had been surrendered voluntarily, which was hardly credible in view of the steep rise in population, which had created a severe land hunger throughout the tract. (Population grew rapidly over the years – in 1951 it was 42,282; in 1961, 71,567; in 1971, 94,185; in 1981, 1,13,664; in 1991, 1,44,009.) The degree of encroachment is brought out by a comparison of the areas considered cultivated as against forest over the course of the past century. In the late 19th century the British had accepted that about two-thirds of the Dangs should be available for cultivation, though by 1911 the forest department had encroached on this to the extent that over half of the tract was classed as reserved for forest [Skaria 1998:619]. A survey of the 1960s recorded that 45 per cent of the area was cultivated. In 1981, however, this figure had fallen to 36 per cent [Hardiman 1996:121-22]. In 1987 only 53,994 hectares was recorded as cultivated land, or 31 per cent of the whole. As there were 62,964 agricultural workers (cultivators plus agricultural labourers) in the district, this represented a land-person ratio of 0.857 or less than one hectare per agricultural worker [Patel 1994].

In 1986, alarm about the rapid destruction of forests throughout India compelled government to impose a total ban on the cutting of trees in reserved forests. At a stroke, the forest labour co-operatives in the Dangs lost their chief function. With inadequate land available for cultivation, a large number looked for work outside their home district, migrating to the plains of south Gujarat to find work as seasonal agricultural labourers. By 1990 about a third of the entire population was so employed, returning to the Dangs only during the monsoon period when work was not available. In the plains, they were badly exploited, being unable to either earn sufficient to send remittances back to their relatives in the villages, or to save much to bring back with them at the end of the labour season. The older people who remained were left often in a state of destitution.

The discontent which was generated by these processes led to a growing assertion by Dangis against the forest officials and corrupt politicians. They demanded that the land taken from them by the forest department be returned and that a new survey be conducted to regularise their holdings. A 'Gram Vikas Mandali' (GVM) was founded to voice these demands. One of its active members, Sonubhai Gavit, told me:

We organised a number of rallies and dharnas to protest against the injustice committed on us by the power holders. We also mobilised educated youths to counter the corrupt and established political leaderships in order to stop exploitation. When forest labour co-operative societies' annual meetings were going on we used to attend and ask for details of expenditure and other account-related matters. Most of the time presidents and secretaries were not in a position to give a satisfactory explanation or to convince members. This is how we exposed them and made people aware of what was going on. Youths of our organisation voiced the complaints of the poor to government officials and put pressure on them to solve these problems. GVM activities have had a profound impact on the Dangis. The solid ground prepared by GVM has been very helpful for other social movements in the Dangs. GVM has been working on broad democratic principles. Their main emphasis is on securing socio-economic justice through peaceful and democratic means. Many educated youths were conscientised through GVM activities and through participating in democratic struggles in Dangs.

From 1989 onwards, the movement took a more assertive turn when some forest guards who tried to confiscate some wood

were chased from Gira-Dabdar village by a group of women who were active in the GVM. They argued that they were the rightful owners of the forests and its timber. Four months later a much larger party was sent, reinforced with police, and some villagers were arrested. The movement however gathered pace, with Dangis entering reserved forest and cultivating the land. In 1991, the forest department decided to restore 'order'. Armed police raided certain 'troublesome' villages, and in one case a bhil woman was killed by firing. The leaders were arrested, activists beaten up, women molested, and property destroyed. By early 1992 the movement had effectively been smashed with the people's grievances unresolved [Hardiman 1996:125-27; Varghese 1993].

II

Community Solidarity in the Dangs

When I carried out fieldwork for my PhD in the Dangs in 1988-89 I found that the village society was extremely close-knit, with a strong emphasis on mutual solidarity and with an intolerance of individual dissidence. In many other parts of India such community solidarity had already broken down or was loosened, but I did not find this to be the case in the Dangs, possibly because of its relative isolation. This was seen in their village councils (panch) and in the way they observed festivals and worshipped their deities. Despite the tensions which existed between bhils and kuknas, all in a village participated in community affairs and ceremonies, in this way giving expression to a feeling of solidarity of the villagers as a corporate group against the outside world.

I found the panch to be one of the most important institutions for Dangis. In all matters of public interest, its decision was final and binding on everybody. According to a Dangi proverb 'The panch is god'. Generally, the 'patel' (headman), the 'karbhari' (who looked after village administration), one or two 'assamis' (rich persons) and one or two old persons, wise by age and experience, sat as the members of the panch. These persons were called upon to intervene and advise in settling interpersonal, intergroup and intervillage quarrels. Dangis had great faith in the panch, believing that its arbitration would set everything right. All persons were considered equal before the panch. I once had a chance at that time to attend a panch meeting at Chikitiya village. The matter concerned a married couple who had quarrelled to the point of separation. The

wife complained to the panch and asked for justice. In a three hour-long hearing, the views of both husband and wife were put forward in an open and democratic way. Members of the panch did not appear to have any bias towards one or the other. The judgment went in favour of the woman, and the husband obeyed it. It was clear that the panch was a powerful instrument for social control.

Strong community solidarities are apparent also in the way the people worship and celebrate festivals. The people, whether kokna, bhil or varli, share a common cosmology which incorporates local deities as well as Hindu gods and goddesses. The chief local deities are Dungar Dev (mountain god), Mavlima (goddess mother), Kansari Devi (grain goddess), Simliya Dev (god of the village boundary and hill), and Gam Dev (protector of the village).

Dungar Dev, the god of the mountain, is believed to reside on the top of eight hills in the Dangs. The god is said to grant relief against all troubles and miseries. A vow is made when some member of the family is sick or the agricultural yield is poor or there is dearth or famine. Coconuts, chicken and goats are offered to the god. Normally, the entire village contributes either in cash or kind. In other words villagers extend their help to the family which has made a vow. On a particular day 30 to 50 men of the village go to Dungar Dev and worship for eight days. The collection of cash or kind is used by this group for food and other rituals. In this way the villagers help families which are in trouble.

Mavlima means mother goddess. Her favours are solicited on all occasions in life and utmost care is taken that she is not displeased. Any unforeseen calamity or accident like untimely death, epidemic or failure of crops is first attributed to the wrath of this goddess. Vows are made when a disease is incurable or the women have difficulty during delivery. Once in a year, the whole village collectively worships and offers sacrifices to the goddess.

Kansari is worshipped at the time of all major agricultural operations, such as ploughing, sowing or harvesting, or when constructing a new house. In a simple ceremony, a handful of grain is placed before the image of the goddess as an offering and a chicken and coconuts are also offered. Each village has a Gam Dev and a Simaliya Dev. Gam Dev is believed to look after the people of village and protect them against natural calamities. This god, represented as a human form

carved out of a wooden block or stone, is enshrined under a tree outside the village. At least twice a year the god is worshipped with great rejoicing and dancing at the shrine. Chickens and coconuts are offered, and rice is collected from each house in the village, cooked at the shrine and then eaten with the chicken in a community feast. The feast represents an expression of community solidarity. Simaliya Dev is similarly worshipped by the entire village.

For Dangs, the main festivals are Holi, Akhatij, Tera, Pola, Panchavi, Pitara and Diwali. Most of these relate to the agricultural cycle. Holi is the most important. It is very different from the festival of the same name celebrated in non-advansi regions. Known also as Simga, i.e., the song of the forest, it is celebrated for five days. On the first day the entire village people gather together and they worship the goddess Holika, and a bonfire is lit ceremoniously. The villagers greet, embrace and wish each other well. The bonfire is kept burning for five days and the young men sleep at night near the fire. Dancing and singing are the main activities of the villagers during the five days. Almost the entire village participate in this festival.

Another important festival is that of Akhatij, which falls in summer. On this day Dangs down tools and do not undertake any economic activity. They normally go to a river and catch fish communally, and have a feast. In the week before Akhatij, they sow seeds of all kinds of grain – nagli, vari, rice, etc. – in a basket, and keep them watered. Within these seven days, the seed germinates. Their growth is observed with interest. The quality of the growth is believed to indicate the richness of crops in the ensuing season. The basket is worshipped on Akhatij and ceremoniously thrown into a river. Dangs also worship the god of cyclone on this day.

The festival of Tera is celebrated during the monsoon, marking the first eating of the monsoon crops. All the villagers go out and search for tera leaves. These leaves are washed, boiled and some salt is added. Before this day, they are not allowed to eat any fresh green seasonal vegetation. Pola also comes in the monsoon. It is on this day that the new field crops are consumed for the first time in the season. Members of a family go to their fields, cut a few stalks of makai (maize) or nagli and cook them at home. The new produce is served to the cattle of the household also. Even if the new crop is ready to be cut in their field before that of others, no Dangi household would think of doing so

before this ceremony. Again this provides an expression of community solidarity.

The celebration of all these festivals and the community mass worship of deities has great social significance in the life of Dangs. These celebrations provide opportunities for mixing with each other in a joyful spirit in a way which enhances their life as a group. They create a sense of common purpose in a life of difficulty and hardship. (Information on Dangi religion and festivals has been drawn from *Gujarat State Gazetteers: Dangs District*, Gujarat Government Publications, Ahmedabad 1971, pp 198-200; and also from my personal discussions with a number of Dangi 'bhagats' (priests).)

The presence of Hindu deities in Dangi cosmology is seen very clearly in their 'kathas' or oral recitations, which are normally given by the bhagats (spirit mediums and traditional healers). I take my evidence in this respect from published transcriptions of kathas which have been collected by Dahyabhai Vadhu, a kukna bank official who has travelled extensively in the villages of the Dangs for this purpose. He and some other educated kukna youths have started a Kukna-language bimonthly called *Dhol*, which publishes material relating to kukna tradition. Dahyabhai has so far collected *Kunasari Katha*, *Dangi Ramayan*, *Thali Katha* (King Mansingh and Queen Savli's tale), *Dungar Dev Katha* and *Mavlima Katha*. One of the striking thing about these kathas is that many of the major characters are Hindu gods and goddesses. Before starting any katha, the bhagat worships Mahadev (the Hindu god Shiva) and Parvati (Shiva's wife).

There is a common belief that Ram and Sita passed through the Dangs in their travels. According to the bhil raja of Gadhvi: "Before there were human beings, the Dangs was full of rakshasas (devils). When Ram and Sita passed through the Dangs they killed all rakshasas and gave birth to us. Ram had created us. Ram is our God." Even today when Dangs meet they use the greeting 'Ram-Ram'. It is notable also that almost all villages have an image of Hanuman, the disciple of Rama, and during festivals and religious ceremonies the people worship and give offerings to this deity.

According to the 1991 Census, 95 per cent of Dangs are 'Hindu'. This is despite the fact that their chief deities are not part of what is commonly regarded as the Hindu pantheon. The fact that their culture recognises some Hindu deities seemed to be the reason why they are so classed. In other respects there is little congruence

with the Hindu religion of the plains regions. They cannot really, for example, be said to practice the system of 'varna', or caste distinction based on considerations of purity and pollution. But again, the separation from the caste society of the plains is not absolute – kuknas believe themselves to be ritually 'purer' than bhils, and will not as a rule inter-dine or inter-marry with them, or even allow them to enter their houses (though cases can be cited in which this general rule has been broken in recent years).

III Christianity in the Dangs

In the census of 1991, the Christian population was recorded as 7,500, or 5 per cent of the whole. The growth in the Christian population is a recent phenomenon. Although Christian missionaries had worked in the areas since 1904, they made very few converts, largely because the Dangi chiefs, kukna headmen, as well as Hindu forest officials had opposed their activities. The first missionaries were Americans of the Church of the Brethren Society. They focused on educational activities, founding several schools [Hardiman 1994:133]. In 1961, only 654 people, under 1 per cent of the population, was recorded as Christian. The major increase has taken place only in the last 20 years, and particularly in the past decade. Missionaries working in the Dangs estimate that there are now probably between 15,000 and 20,000 Christians. There are about 22 Christians organisations of different denominations now active there.

According to Father Raphael, a Jesuit based in Pimpri, Roman Catholic Jesuit missionaries came to the Dangs in the early 1970s after being invited by some kukna political leaders to establish schools in the area. They now run four primary and one secondary school and some village dispensaries which provide primary health care. The secondary school is based at Ahwa, with about 1,000 pupils who are mainly the children of government employees. Only about 30 per cent of them are Christians. There are about 1,200 pupils in the four primary schools. They are providing primary health care to Dangs. Proselytisation is not a priority for the Jesuits.

Reverend Pawar of the Church of North India (a reliable source) estimates that about 95 per cent of the Christians in the Dangs today are Protestant. In contrast to the Catholic missionaries, very few of the Protestants undertake developmental activities. They are mainly engaged in winning

converts to Christianity through emphasising the miraculous power of prayer. They teach the people that their problems can no longer be solved by their own deities and that they should turn to Jesus Christ. Govind Kokni of Kasadbari village told me in an interview that he had converted because "...when my father was sick, Christian missionary came to my home and prayed to god for my father and he was cured, so I started believing in Christianity". Some of the Protestant missionaries claim that the dumb, the deaf and the crippled can be cured through prayer. Public meetings have been held to exhibit those who, it is claimed, have been so cured. Some denominations rely mainly on miracles to attract converts. The pentecostals (known locally as the 'Haluliya' sect) has been particularly successful in this respect. In times of ill health, they even encourage their followers to trust to prayer rather than doctors. A case of this is provided for us by Tara Gamit, a sociologist who comes from the Dangs, and who is now based at Rajkot college. She states:

In one of the village of the Dangs a woman became seriously ill with jaundice. She and her family members were followers of the 'Haluliya' sect. Some of the villagers tried to take her to the dispensary but her family members and sect followers did not allow this. They said that god would help her. They gathered around her bed and started praying to god. They did it for four days. At last she died. They rationalised the death and said that god wanted her and hence he took her.

Govind Kokni of Kasadbari also told me:

...during the ceremonies of worship for Gam Dev and Dungar Dev, the Dangs drink liquor, sacrifice animals and worshipped stones. Such rituals and customs are not good. We refuse to participate in such ceremonies. We believe that Jesus Christ is the ultimate and only god for us. By praying to Christ we will go to heaven. Christ protects us from evils and illness. Non-Christians gods are mere stones and we have no respect for any of that.

This reveals that the converts have lost faith in the ability of the old deities to protect them at times of need. There is a desperate yearning for protection from a more effective cosmological force, and they have therefore turned to a deity which they feel is more efficacious in this day and age – Jesus Christ [Vitebsky 1998].

As a rule, Dangi Christians remain aloof from community festivals and religious ceremonies, and refuse to give any contribution for them. This is a cause of great indignation, as other Dangs see this as

both a denial of their responsibilities and an attack on community solidarity.

The non-Christians resent what they see as the attitude of arrogance and intolerance adopted by the converts. In the words of a former local RSS activist whom I interviewed:

Those who are Christians believe that they are free from any sin and curse and that a place is reserved for them in heaven after death. Because of this belief they consider themselves socially higher than non-Christians. There is a widespread belief amongst themselves that other religions, i.e. Hindu, are degenerate and bogus and their deities are mere stones and nothing.

Madhu Gaikwad, a kukna from Dangs and lecturer in sociology at South Gujarat University, Surat, says that the Christians feel that they have liberated themselves from the old beliefs and ways, which they now consider to be morally inferior and 'backward'. It is claimed also that the Christians are undermining society by dividing up families. Jivan Rathod, a BJP member of the Dangs district panchayat, and, ironically, himself a Christian, voiced such feelings to me in an interview: "There are families in the Dangs in which a son was converted in Christianity and the father was not. Similarly one brother was converted and the other was not. In such families there are occasions on which tensions develop over the performing of social rituals."

The converts on the other hand believe that they are discriminated against for turning to Christianity. In 1988, when I was carrying out my fieldwork in Basania, a village bordering the Dangs, I was told by Dhiru Kokni, secretary of Vyara Taluka Kristi Kalyan Samiti (Christian Welfare Committee), that:

...after we became Christians, non-Christians give us step-motherly treatment. In the traditional village panchayat our grievances have not been redressed because we are not following kukna rituals. They asked us to seek help from the Christian missionaries. Kuknas say that you Christians have created a divide in the social and cultural life of the village. Furthermore, they say that we adivasis (kukna) have our indigenous rituals, religious and customs which have been passed down from our ancestors, and whoever rejects them is not a real kukna.

There was, therefore, antagonism between Christians and non-Christians in the Dangs and adjoining tribal areas of Dangs long before the recent events. The violence, however, is new, and can be attributed to a more recent highly politicised 'Hindu backlash'.

IV Hindu Reaction

The wave of conversions to Christianity has alarmed those in Gujarat and elsewhere who believe that there is a close connection between Indian nationhood and culture and Hinduism. They resent what they see as a 'foreign' religion capturing the hearts and minds of adivasis. They have therefore sought to reverse this tendency with a strident counter-proselytisation of their own.

Sects which have sought to convert the adivasis to their own brands of Hinduism – normally of a Vaishnavite 'bhakti' (devotional) variety – have been active in the Dangs for many decades. Most prominent has been Moksha Marg. This sect was started in Ahmedabad in the early years of the 20th century, and began to proselytise amongst the adivasis of south Gujarat in the early 1950s. It emphasises moral self-reform, with followers renouncing meat, fish and alcoholic drinks. They aim to attain 'moksha' (emancipation) through bhakti (devotion to god). In the Dangs, most of the followers of this sect are kuknas. Other Hindu sects, such as Sat Keval, Swadhyay and Swaminarayan, have a similar emphasis on devotional worship, vegetarianism and teetotalism. It is important to note that, in contrast to Christians, followers of these Hindu sects continue to worship their traditional god and goddess and participate in community festivals and celebrations. The Swaminarayan sect has become active in the Dangs as a direct result of the conversions to Christianity, and very recently at that. The initiative in this respect was taken almost single-handedly by a 'sadhu' of this sect called Purshotam Prakashdas Swami (popularly known as P P Swami), who travelled around the district to study its problems. In an interview he told me:

The Christian missionaries have drawn their mark in the Dangs and we do not want to erase this mark, rather we would like to draw a bigger mark through our own developmental activities. Once our mark becomes bigger, that of the missionaries will automatically become smaller.

He also stated that:

The need of the hour is for Hindu organisations to change their style of mobilising people and adopt more of a 'Church' style. This means Hindu organisations must adopt the methods of Christian missionaries. Then and then only one can combat the issue of conversion

By this last remark, P P Swami meant that Hinduism needs to become a more

focused project by learning from Christianity. In India, the Swaminarayan organisation is exemplary in this respect. Originally merely one minor Gujarat-centred sect ('sampradaya'), it now projects itself as the global face of Hinduism, with grandiose 'Hindu temples' all over the world which are run by a monastic order of celibate sadhus who gain their legitimacy by providing for both the spiritual and socio-economic needs of the people. Developmental work is central to this approach.

P P Swami has founded a trust called 'Prayosha Pratisthan' to carry out such work in the Dangs. According to the literature of this body:

Dangs district in Gujarat has the highest number of tribals. Though this district is considered to be a Chhapunji [place of highest rainfall in India] of Gujarat, most of the villages of the Dangs have been facing an acute shortage of water. Black magic, superstitions, illiteracy and poverty are the key problems of the Dangs. Because of all these evils, Christian missionaries are easily converting Dangs to Christianity. Prayosha Pratisthan has been set up to stop these conversions. The main activities of the Pratisthan are 'anna', 'arogya', 'akshargyan' and 'acharan', i.e., providing food, better health care, literacy and inculcating good conduct.

Prayosha Pratisthan is mainly engaged in developmental activities among poor Dangs. So far the body has arranged eye and dental check-up camps, cricket tournaments, established 'bhajan mandali' (devotional song groups), youth clubs and 'mahila mandal' (women's associations). It runs classes for school children. It also intends to open non-formal schools for children whose parents migrate to the plains of Gujarat to cut sugarcane during the winter. It intends to set up drinking water stalls in the villages where drinking water is scarce during summer. It is also planning to organise a mass marriage ceremonies in the month of May, so as to minimise marriage expenses. It is hoped that some 125 couples will participate. Pratisthan will bear the total expenses and also give a clothes and utensils as wedding gifts. The ceremony will be performed according to Hindu rites. (On May 15 mass marriage took place at Ahwa and 120 Dangi couples got married.) Pratisthan has adopted a remote village called Don for an all-round development project. The chairman of the trust is veteran Gandhian Ghelubhai Nayak, whose name has been mentioned earlier in this article. At present P P Swami places most emphasis on developmental work, rather than Hindu

proselytisation as such, though the two go hand-in-hand.

Proselytisation is much more to the fore in the work of a 'sanyasi'-based at Waghai called Ashimanandji. Originally from Bihar, this man had worked in Mizoram, trying to convert tribal peoples from Christianity to Hinduism. He had little success in this, and came to the Dangs searching for a more favourable field for his activities. He spent a long time touring the villages of the district, building rapport with the locals. He appealed to them in an idiom they could appreciate. Finding that Hanuman is worshipped by every Dangi, he went from door-to-door handing out prints of the deity and copies of the popular book of prayers to Hanuman – the *Hanuman Chalisa*. The people were impressed, as so far no Hindu religious leader had visited their homes, and they gave him a warm welcome. As the general secretary of the BJP for Dangs district told me:

Ashimanandji moved extensively within the Dangs and studied its situation. He took a very innovative approach. He used to visit the poorest of all families, sit with them and eat whatever they ate. He questioned them about their difficulties and problems and cultivated good relations with them. This appealed to the Dangs very much. He also found that most of the Dangs are non-vegetarian and take a drink at the end of the day. He did not interfere with these habits. In fact he told the Dangs 'khao pio kuch bhi karo lekin Hindu raho' (eat, drink and do whatever you want, but remain Hindu). This is how he tried to spread the Hindu religion. Most important, Ashimanandaji kept up personal contact with each family.

With help from the VHP and Bajrang Dal, he established his base at Waghai, which is situated strategically on the chief road-border between the Dangs and the plains of south Gujarat. He operates an organisation called the Vanvasi Kalyan Parishad, which runs schools and hostels in Dangs. He has also constructed a temple on top of a hill near Subir, called the Sabari temple. He claimed that when Rama was passing through this forest he visited a bhil women called Sabari and blessed her. The name of the village Subir came from Sabari. Many Dangs have come to believe this too. The construction of the temple is still going on. I was told that about Rs 20 lakhs would be spent on this temple. The ruling BJP government of Gujarat has constructed a two kilometre road to reach this temple. Ashimanandaji believes that the Christian conversions are part of an international plan to divide India. His aim

is to eradicate Christianity in the Dangs completely.

Politicisation of Religion

As mentioned above, the Dangs district panchayat was controlled by the kukna leaders of the Congress Party for 25 years without a break (1970-96). They had misused power for their personal gain and did not bother to redress the grievances of the people, such as the issues of landlessness, rising unemployment and labour migration. Dissidence had been crushed ruthlessly, even violently, and they used their money-power to prevent questions being asked by officials. With the emergence of a new generation of educated Dangi youths, their style of operations began to be resented increasingly, leading to a series of challenges.

One such challenge was by Soma Pawar of Nakatiya Hanuman village, popularly known as Somaji among his friends. He was an energetic, bold and clever youth. When he was studying in school he formed a student guidance club, which sought to encourage Dangi youths to pursue higher studies. Through this activity, he became popular amongst the students. He also raised his voice against the corrupt practices of the Congress leaders. One of his chief targets was Dhedu Pawar, chairman of the district panchayat education committee, and also from Nakatiya Hanuman. Realising that Somaji was a potential threat to him, he sought to block his advance. When Somaji was admitted to college to study for a diploma in engineering, the politician tried to persuade Somaji's father to refuse to allow him to continue his studies. He knew that if he qualified as an engineer he would be in a strong position to challenge him. Somaji's father refused to heed Dhedu's advice and supported Somaji in his further studies. After becoming an engineer Somaji started mobilising the people against the corrupt practices of Dhedu. Somaji contested the taluka panchayat election of 1986 and won. Dhedu could not tolerate this blow and decided to get rid of him. He and his supporters attacked Somaji's house and compelled his family to leave the village. During my PhD fieldwork I met Somaji at Tekpada near Kalibel in August 1988. He was sheltering there in a little hut with his wife and small son. Somaji told me in detail about the corrupt functioning of the forest labour co-operative societies and district panchayat. He also told me how he had been chased out of his own village. At that time he felt helpless and

frustrated but decided that he had to continue in his fight against corruption. I vividly remember that he told me: "I know that I will be killed sooner or later". Tragically, he was only too right. In September 1989, when returning from a visit to his village, he was waylaid by a group of people and murdered brutally.

His brother, Dasharath Pawar, who had just completed his higher secondary examination at the time of his brother's death, took up his case and demanded justice. He met a number of leaders but did not have any success. He even wrote to the governor of Gujarat asking for a CBI inquiry into the case, but nothing happened. In the meantime, he was selected as a supervisor in the government health department, but he rejected the offer and decided to fight back politically. He was elected general secretary of the Arts and Commerce Collage, Ahwa. During that time he came into contact with an RSS activist called Vinay Patrale, and came under the influence of RSS ideology. He then joined the BJP so as to be able to challenge the established Congress leadership. He is now a general secretary of the Dangs unit of the BJP. In an interview Dasharath Pawar told me:

In the Dangs the Congress leaders had cheated the people and not done anything for their welfare. When my brother started doing good things for the people he was killed. The Congress leaders had solid backing from the state and central government because at both places Congress was in power. The entire bureaucracy and police were under the control of the Congress leaders. We were helpless but we strongly felt that there had to be an alternative politics to challenge the established leadership. Since there was no possibility of any mass mobilisation or the creation of a viable alternative local party we decided to join the BJP. You can see now that Congress leaders have been removed from power. Since we have captured power in the last two years, we have been carrying out developmental activities in Dangs.

Another young man who played an important role in popularising the Hindu right in the Dangs was Ramesh Chaudhry of Don village (popularly known as Ramesh Don). Now 25 years of age, he studied up to matriculation. Ramesh had a very bitter experience when he was at school. In 1989 he contested the election for general secretary of his school at Ahwa. He won by a big margin. Despite this, he was denied the position by the principal, Santa Patel, on the grounds that he did not know 'proper' Gujarati. Instead she

appointed her own candidate. Ramesh knew about Dasharath Pawar and his dissident group, and he won their support for a strike by the pupils at the school. The matter became controversial, and in the end Ramesh was reinstated as general secretary. Ramesh became active in the RSS and later on became president of the Dangs unit of the BJP.

Many other youths joined the BJP because of the corruption of the local Congress Party. Even Christians joined the BJP for this reason. In the last district panchayat election there were six Christian candidates who were elected on BJP tickets. One of them, called Jivram Rathod, told me: "I was fully aware that the BJP has an anti-minority agenda, but in spite of that I supported the BJP because by hook or by crook we wanted to dislodge Congress from the Dangs district panchayat".

After joining the BJP they sought to win popular support by a number of means. One of their initiatives was to issue health kits to activists and launch a health campaign. However, this had little impact. In March 1997 the BJP held a brain-storm meeting at Valsad town, outside the Dangs, to discuss the issue of widening their support. The example of the sanyasi Ashimanandji was brought up, and how he had understood the feelings of the people and gained their sympathy through appeal to their cultural and religious sentiments. They felt that there was widespread disquiet in the Dangs over the issue of Christian conversion, and felt that they would do well to take up this issue. It was decided to hold a 'trishul' investiture ceremony at Ahwa. Prior to this 2,000 copies of a pamphlet were distributed by the Bajrang Dal, urging the people to attend. The ceremony was attended by 5,000 youths from different villages of the Dangs. They were told that their religion was under threat and that they should awaken the people as to this danger. Seven hundred trishuls were then distributed.

This has led to a situation of mounting tension in the Dangs. The Hindu right claims that the violence was started by the Christians, who destroyed a temple at Jamalapada village near Gadhvi in August 1997. In retaliation, the non-Christians disturbed a prayer meeting. A former RSS activist whom I met claimed to possess a photograph of the destroyed temple. According to the Hindu right, they were caught out by the hostility of the Christians, but then began to organise themselves to defend their faith.

Whatever the truth of this claim, the Hindu right was behind a wave of harassment of

Christians in the Dangs, beginning in late 1997. Besides the BJP, the RSS, BD, VHP and Hindu Jagran Manch (HJM) have all been involved in this anti-Christian activity. For example, in November 1997 a complaint was lodged with the police by a VHP activist of Gadhi village against the local Christians, which led to their being questioned in an aggressive manner by the police. Soon after the police patrol of Kudkas beat up a Christian evangelist as he was cycling home from a prayer meeting. On Christmas day 1997, the VHP organised a rally to stop conversion at Pipalwada village, which borders the Dangs, on the grounds that mass conversions regularly take place on that day and that they had to be stopped. The Christians asked the government to prohibit the rally, but despite this the rally went ahead, being attended by 5,000 adivasis. Next day, on December 26, some Christians at Dagadpada in the Dangs were harassed by a crowd while the police looked on, after which some Christians were arrested (*Communalism Combat*, October 1998, p 14). In all, some 20 cases of disturbances of some sort or other between Christians and non-Christians were reported from the Dangs in 1997.

Sporadic attacks on Christians continued in early 1998. In June, anti-Christian pamphlets were circulated throughout the Dangs by the BD, VHP and HJM. In one, signed by Ramesh Don on behalf of the HJM, it was alleged that adivasis were being bribed to convert. The missionaries (dubbed as 'devils') were said to be exploiting the people; all over the world, Christian missionaries have looted gullible people; they teach the adivasis to steal and lie in the name of religion. Hindus were called on to awake and fight the missionaries. On June 29, Ramesh Don and the HJM organised a huge rally at Ahwa to submit a memorandum to the collector of the district, protesting against the conversions. Slandering speeches were made denigrating the Christians. In June and July there were a series of attacks on prayer halls and churches, with congregations being assaulted and the buildings set on fire (these were mainly 'kachcha' structures of bamboo and wood). In one case, a Christian was killed. Local officials and police officers frequently connived in these attacks (*Communalism Combat*, October 1998, pp 4, 10, 14; 1999:3-4).

After a lull during the monsoon season, the attacks began again in November 1998, with more arson, beatings and looting of Christians. This culminated in the violence around Christmas which was set off after the district collector gave permission

for a massive anti-Christian rally at Ahwa on Christmas day. This was in spite of repeated requests by Christians organisations and the Dakshin Gujarat Lok Adhikar Sangh (South Gujarat Human Rights Organisation) for permission to be refused. The Hindu organisations took out a procession during which anti-Christian slogans were shouted. At the meeting inflammatory speeches were made condemning the missionaries and Christianity. A number of Christians shops were ransacked and looted by activists of the Hindu organisations. In the following days 36 churches and prayer halls were destroyed in villages throughout the Dangs. Christians were beaten up and injured. Missionary-run schools were also damaged.

VI Dangis' Comment

In March 1999 I visited the Dangs to talk to people there about the attacks on Christians. One of my first stops was at Chankhal village, where I met a grandfather, father and son of the bhil community who were working together preparing their land for cultivation. When I asked their reaction to the recent events, the son, who had matriculated, reacted sharply:

All of us Dangis are Hindus. Our main god is Hanuman. All Dangis must worship Hanuman. Christians are not worshipping Hanuman and not following the traditions of our elders. Today in the Dangs one finds that in the same family the father is a Hindu and the son is a Christian. When there is any traditional religious festival, the son does not participate and hence there is a conflict between father and son. Last year in our village we had a Dungan Dev ceremony. In this ceremony all of the villagers contributed in kind or cash and gave help. The Christians did not contribute. They said that our religion is different and we do not want to participate in Dungan Dev. Due to this the solidarity of the village has been broken. Even in very minor matters the Christians always take an opposing stance and hence hostility has developed.

The statement brings out very strongly that 'community' is not seen as a voluntary or individualistic affair. In the strident declaration that Dangis are Hindus, that they must worship Hanuman and so on, there is a strong assertion that members of the community have to conform to certain practices, the implication being that failure to do so will be met with censure. The statement is also dyed with the saffron of hindutva consciousness, invoking a very modern belief that everyone who

worships Hanuman, etc, should be classed as 'Hindu', however tangential to mainstream Hindu religion the bulk of their cosmological practice may be. Although this young man's grandfather expressed similar views, there was a lack of stridency in his tone, and he added that he regretted what had happened in recent months, but felt that too much fuss was being made of it all.

Later, I talked to a local socialist activist who has been fighting for land rights for Dangis during the last decade. He was also unhappy about the way in which the Christians were detaching themselves from village society, and saw this as the reason for the antagonism. He narrated an instance which he himself had experienced:

I along with a Dangi Christian grass roots activist went to a village for a meeting. On that particular day the village people had organised a community meal after worshipping Gamdev. They invited both of us to participate in the meal. Surprisingly, the Christian activist refused the offer as he believes that worshipping Gamdev is against the Christian religion. Such cultural alienation has divided the Dangi community and created mutual hatred.

Although condemn the violence, the socialist felt that conversion was having a very negative effect in the Dangs as it was undermining one of the great strengths of the society, their sense of solidarity. Even though this has not always protected them adequately against exploitation by non-Dangis, it provides a continuing basis for mobilisation and struggle. By dividing the people, the Christians are, in his view, undermining the ability of the Dangi people to fight for their rights.

In Ahwa, I met number of college students staying in the government hostel there. They repeated the theme that Christians are creating social rift. For example, one of them stated:

Take me as an example; in my family my uncle was converted to Christianity and father was not. When my grandfather died there was a quarrel in front of his dead body. My father was insisting on performing the Dangi death ceremony while my uncle was insisting on Christian death rituals. There were heated arguments between them. At last some elders intervened and said that as grandfather was not a Christian and he had followed Dangi culture till he died, the Dangi death ceremony should be performed. Though that settled the issue for the time being, there is still hostility between the two brothers.

One of the students, Rajesh of Chichli village, complained of the 'trickery' used by certain missionaries:

Christian missionaries go to remote villages in the Dangs where the tribals are absolutely ignorant and dupe them into converting. They place stone idols of Hindu gods and goddesses in a tub filled with water. When these idols sink, they tell the tribals 'how will your gods help you when they sink themselves?' They then offer their solution. They pull out an idol of Jesus Christ made of rubber and place it in the tub. When it floats on top of the water they say: 'See, see how Christ manages to stay afloat. He is the only god who can help you.'

When I asked Rajesh whether he had actually seen this happen he answered that he had not seen it with own eyes but had been told about it by fellow villagers. Another student interrupted, stating with disgust that:

Why are you questioning the validity of what Rajesh has told you? Just visit any of the Dangs village and you will find out what harm these missionaries have done to Dangs. We are not accusing all missionaries of such tricks because those at Pipri, Ahwa and Subir have done good work. Because of their schools we have been able to study. It is missionaries from Madras and Kerala who are doing these nasty things.

Here, a difference is being drawn between what are alleged to be opportunistic missionaries who dupe the people for sinister (possibly anti-national?) reasons and those such as the Jesuit fathers who have been around a number of years, who focus on educational and other developmental work, and who are sensitive to local culture.

The attitude of these young educated Dangis can be interpreted as being similar to that of the socialist activist, involving a belief that conversions are undermining the solidarity of an exploited people. But there is a troubling further possibility – that they have a vested interest as an emerging local elite in maintaining a cohesive community because it will form the basis for their own future power. Although this observation might be unfair to these particular students, it is based on a recognition that this is what has happened in the past – educated young Dangis who have challenged the old elites with success have then deployed the coercive apparatus of the 'community' against internal opponents. 'Community' can work both ways, on the one hand as a means for popular democratic empowerment, but on the other as a tool for authoritarian control by a local elite.

The theme of the supposed anti-nationalist agenda of the missionaries was brought up more explicitly by a Hindu sanyasi, Asanganadji, whom I met at Pravasi Grih in Ahwa. He was on a tour of the Dangs to spread nationalistic Hindu religion and ideology. He was motivated by a fear that if conversions continued at the same rate as they have over the past decade, the Dangs will become another Mizoram, with the people demanding that the tract be allowed to separate from India and become a separate Christian country. He treated me cordially and gave an impression that he was prepared to listen to criticism. He asked me for my personal opinion on the issue of conversion. I told him:

I have respect for our Constitution, and according to the Indian Constitution individuals are free to preach and choose their religion. Since Hindus are in the majority it is our moral duty to regard the feelings of minorities and protect them as citizen of this country. One must think sympathetically towards minorities.

Reacting to my comment, Asanganadji stated:

Hindu intellectuals have done the greatest harm to our Hindu religion. What you are saying is 'sadgun vikriti' (a perversion of virtue). Because of such vikriti (perversion), Muslims, Christians and other minority religions are flourishing in India and are threatening our own religion. Tolerance is good but beyond a point it is harmful. Due to such vikriti, intellectuals and the English-language electronic and print media have taken the side of minorities and have pampered them. Minority religions have been encouraged to propagate their religions without any scrutiny. Now, it is an established fact that Christians and Muslims get financial support from foreign countries and the motive behind this financing is very clear. In the interest of the nation it is our duty as true Hindus to protect our nation and our great Hindu religion.

In this case, nothing is said about the Dangi community and local issues. The emphasis is on a different sort of solidarity, that of the supposed duty of all true Indian nationalists to propagate the Hindu religion. Those who follow other faiths are, in such a light, not really Indian, and must by definition be allied with non-Indian and anti-nationalist elements. Even those who stand up for the rights of minority religious groups become suspect – being open to accusations of being 'westernised' and in thrall to an alien culture associated with English-language newspapers and the modern media (ironically, the Hindu right has in fact proved far more adept in

its use of the modern media of television, film and audio-cassettes than its opponents). The real agenda in all of this is in fact a highly political one, that of building a majority constituency based on a 'Hindu' identity, which is identified in terms of a supposed threat to its existence from non-Hindu religious communities – Muslims and Christians – along with various so-called 'pseudo-secularists', such as deracinated Anglicised intellectuals, socialists and communists. As is clear from the experience over the past two years of BJP rule in Gujarat, once a government is formed with such an agenda that much-vaunted Hindu value of 'sarva dharma samabhav' (equal respect for all religions) is thrown violently out of the window. This is very clearly a manifesto for intolerance and extra-legal forms of repression.

I also met the Dangi BJP leader Dasharath Pawar, who took a leading role in organising the rally against Christians on Christmas day which led to an intensification of the violence. When I asked him about this, he became agitated and said:

It is our right to organise a rally. When Dangi culture is under threat how can we restrain ourselves? We know very well that on Christmas day there would be mass conversions. As a true Dangi it is our duty to stop such nonsense. Today Christians are not participating in village festivals. They consider that Hindu deities are mere stones and should be thrown out. Such kind of propaganda has been openly made in public meetings and through leaflets. In the last 15 to 20 years so many missionaries have come to Dangs from south India and have converted Dangis through allurements and miracles and have damaged the cultural fabric of the Dangs, but when Ashimanandji came there was a hue and cry about his entry into the Dangs. He is giving voice to the feelings of Dangis against Christians. He has just been visiting ordinary people, mingling with them as if he is one of them, and giving them prints of Hanuman and requesting them to worship our ancient god Hanuman. Do you think this is a crime? Our village life was peaceful and happy in spite of poverty, unemployment and economic inequality prior to the entry of the Christians missionaries into the Dangs. Due to conversions village social and cultural life has been disturbed. Christians are deliberately not participating in village festivals like Holi, Tera and Gamdev.

In this statement two assumptions are made which may be questioned. One is that Dangi religion is 'Hindu' in an unproblematic way. In fact, sects like the Moksh Marg have been operating in the area for decades trying to convert the

people of the area to what they see as 'correct' Hindu practice. Ashimanandaji follows in this tradition. Like the Christian missionaries, he is engaged in a campaign of conversion. It is argued that such 'Hindu' campaigns are less confrontational as the people are permitted to continue to observe their old social customs and worship alongside the new. This sort of argument has been exposed by the recent violence, which has been highly confrontational and divisive. The other assumption is that being a 'Dangi' involves being also a 'Hindu'. In such a view, converts to Christianity become 'outsiders', or in other words, 'non-Dangis'. Mischievous 'foreign' elements (the missionaries) are seen to be turning many gullible local people into 'foreigners' ('traitors?') within their own homeland. By rejecting their heritage, these Christians have, it is held, put themselves outside society and the law, and coercive extra-legal violence against them becomes justified.

We may also note how the original reason why people like Dasharath Pawar entered politics, namely, the corruption of the ruling Congress bosses and their lamentable failure to develop the Dangs economically, has not merely dropped into the background, but has been completely disavowed. We are now told that despite the 'backwardness' of the tract, the people were 'happy' before the entry of the Christian missionaries. The economic exploitation of the mass of the people by outsiders and local elites is no longer considered to be of any political importance. Such a stance indicates that the BJP politicians who now control the Dangs intend to ignore these problems while whipping up electoral support using anti-Christian paranoia and hatred. In effect, they are set merely to become the new elite, manipulating a coercive and undemocratic 'Dangi tradition' to prop up the new status quo.

That such a stance might ultimately prove counter-productive is indicated by a bhil of Chankal who I spoke to called Jataru Akhatiya. He stated:

The recent attacks on Christians were unfortunate. Such actions are against Dangi culture and ethics. We have been living harmoniously for the last century and we shall go on living harmoniously. The political parties have a vested interest in dividing us. We understood their game. The real questions for Dangis are those of poverty, unemployment and rights to use natural resources.

There is an important shift here from the commonly voiced argument that the Christians have been the foremost divisive element in the Dangs. In this case it is understood that the appeal for Hindu

solidarity is even more divisive, for what had previously been a matter of essentially non-violent altercations within village life, has now escalated into a bitter and vicious internecine strife. This conflict is understood, furthermore, as failing to address the issues of greatest importance to the mass of the Dangi people, such as lack of employment, land hunger, oppression by forest officials and labour migration. The politicians who are orchestrating the attacks on Christians are exposed as having no solutions to these problems.

VII Conclusion

The issue of conversion is thus a complex one. At a local level, Christian missionaries have often been appreciated for providing good educational opportunities for adivasis in a situation in which government has failed to provide adequate facilities. Christianity is also providing many adivasis with a set of cosmological beliefs which they believe are appropriate to their present situation. The bhakti variety of Hindu practice can equally fulfil such a role, and in fact it probably has in a much larger number of cases, but as all forms of non-Christian and non-Islamic practice are recorded merely as 'Hindu' in the census report, we have no means for quantifying such a tendency. The desire of Christian converts to follow their own religious practices and disavow the community festivals and forms of worship of the village community as a whole is deeply resented. In part this is because this represents a threat to one of the great strengths of the life of the people – their solidarity in the face of outsiders. But it also challenges the vested interests of the existing village elites, who resent this as a challenge to their social power and control. Initially, conversion gave rise to much bickering and bad feeling, but until two years ago there was no violence in this respect.

The violence has been the result of two further developments. One relates to the challenge by young educated Dangis against the old political leaders who were allied with the Congress Party. Seeking wider allies in their struggle, they gravitated towards the BJP. The other relates to the statewide politics of Gujarat, in which the BJP has over the past decade become the most popular political party, winning sweeping victories in recent elections. The BJP has relied heavily on whipping up support through inculcating a belief that Hindu religion is under threat from foreign backed religious minority groups. It projects itself as the only party which stands up strongly for Indian na-

tional interests in this respect. To justify this stance, it is always on the lookout for various supposed 'threats from within'. When the BJP and its allies in the Sangh parivar learnt of the mass conversions to Christianity in the Dangs in recent years, they identified this as one such threat, and sent in their political holymen to investigate the causes and come up with solutions. The sadhus and sanyasis quickly made common cause with the young local BJP leaders, persuading them that they had to focus their attention on the issue of conversion rather than socio-economic problems. They introduced them to a rabidly communal style of politics, using hate-filled rhetoric against minority groups, in the manner of such rabble-rousers as Sadhvi Ritambhara and Uma Bharati. It was these young local politicians who then orchestrated the deplorable wave of violence against the Christians of the Dangs.

Elections and Macropolicy Signals

Political Budget Cycle Hypothesis

Mala Lalvani

With governments not lasting their full term, Indian politics is in a state of turmoil. For a developing economy like India where it is of utmost importance that limited resources be efficiently channelised, elections held at such frequent intervals impose a heavy cost. In addition to the large visible cost of campaign expenses and expenses incurred in its administration, there is a large hidden cost on account of the fact that politicians make every attempt to appease various lobbies around election years. The present study is an attempt to test political budget cycle hypothesis which tracks the behaviour of the incumbent around election years.

ELECTIONS is the lifeline of every democracy. For a democracy as large as India the significance of elections can hardly be overemphasised. With elections and election analysis ranking high on popularity given the presentday political scenario, the time seems opportune for the relatively young sub-discipline of economics 'public choice' to show what it has to offer to an understanding of the behaviour of people in government around election time.

The public choice school has helped in transcending barriers between economics and politics. Economists today, both theoreticians and empirical practitioners, are making concerted efforts at taking into consideration the reality of presentday politics, for public choice has made the economist realise that even sound economic advice is bound to go unheeded by the policy-maker if it is not 'politically viable'. This interdisciplinary approach of public choice has succeeded considerably in bringing economics out of the realm of abstraction and closer to the reality of politics.

In the arena of elections, the public choice school makes the point that the presence of elections and electoral competition is indeed the mainstay of a democratic form of governance, but these very elections also serve as the *raison d'être* of many strategically motivated policy distortions that are indulged in by politicians. No theory in economics or politics is required to make one realise that people in power would wish to remain in power – but for that elections must be contested and won. While the voter can only make some guesses about how the parties in opposition might fare, they are in a position to make judgments about the incumbent party on the basis of the policy measures that are undertaken.

With policies serving as a signal to the voter regarding the intentions of the governing party it is only natural to expect that the policy measures which the incumbent party takes would be such that the voter is led to voting that party back into power. Also, it would not be unnatural to

expect that efforts at pursuing such policy measures, which are bound to win votes will be intensified with the approach of every election. These arguments, which seem common sense knowledge today, were given a formal treatment by William Nordhaus in 1975 who saw this kind of behaviour on the part of politicians as resulting in political business cycles although the term itself was coined by Kalecki in 1943. Kalecki predicted the emergence of cycles with alternating 'stop' and 'go' phases when capitalists opposed full employment stimulated by government spending, thus making the government withdraw only to re-emerge as a stimulating agent when unemployment rises above an 'acceptable' level. In current literature, political business cycles have gained wide popularity as 'political budget cycles' [Rogoff and Sibert 1988; Rogoff 1990]. One can adequately explain political cycles with the simple observation that people in government artificially create unusually favourable economic conditions before an election and that voters reward incumbent governments for doing so, even though the economy will take a turn for the worse immediately after elections.

While there has been a surge of papers examining the phenomenon in the developed countries, in the Indian context only two papers have made any attempt at examining its presence [Karnik 1990; Sen and Vaidya 1996].

The present study, in order to test for presence or otherwise of political budget cycles, at the first instance looks at mean growth rates for key macropolicy variables in pre election, election and post-election years. Further, in this study we break away from the conventional restrictive technique of testing the political budget cycle hypothesis by looking for sharp perturbations in and around election years. The large volume of studies which have employed this technique have generally operationalised their models by introducing a single dummy variable for the election year or a dummy variable allowing

for some time period before or after elections. In this study, rather than look for any such sharp blips, we make an attempt at examining the behaviour pattern followed by macropolicy variables spanning the electoral terms. The technique adopted is somewhat similar to that suggested by Haynes and Stone (1989). Our study makes an attempt at adapting their technique to the Indian scenario.

Section I of the study reviews some of important contributions to the subject of political business/budget cycles and traces the cyclical pattern that political business cycle literature has itself followed. Section II deals with methodology and Section III examines the behaviour pattern for key budgetary variables and reports the empirical findings of our study. Section IV applies a similar methodology to some non-budgetary variables which could be subject to manipulation by the government in and around elections. Finally, Section V concludes:

I Survey of Literature

Several different strands have been discerned in the literature on political business cycle (henceforth PBC). One approach originating from Nordhaus (1975) views it as rational for the incumbent politicians to generate PBC in order to strengthen re-election chances when voters are seen to be myopic. The central conclusion of the Nordhaus model in his own words is "The unemployment rate must be falling over the entire elected regime...immediately after an election the victor will raise unemployment to some relatively high level in order to combat inflation. As elections approach, the unemployment rate will be lowered..." [Nordhaus 1975:184].

A second strand has taken off from Hibbs (1977). It holds that in a class-based electoral system it might be rational for the political party to pursue its own ideology once in government.

A third approach to PBC integrated the preceding two alternatives. Government

FIGURE 1: DEFICITS ON REVENUE ACCOUNT

FIGURE 2: EXPENDITURE ON REVENUE ACCOUNT

is seen to be ideological but as soon as its re-election chances are threatened it resorts to measures which would increase its popularity [Frey and Schneider 1978; 1979; 1981].

Advocates of PBC hypothesis came in for some scathing criticism at the hands of the rational expectations school. These rational expectations theorists questioned the fundamental tenet of PBC literature, viz, myopic voters, and put forth the view that a rational electorate would 'learn' to penalise undesirable actions of politicians. Once the electorate was forward looking and informed about the macroeconomic structure, it could devise an optimal plan over the entire horizon, vote strategically by penalising politicians for any deliberate strategic deviation [MacRae 1984; Minford and Peel 1982; Chappell 1983; Ploeg 1984; Kirchgassner 1985; Lachler 1984; Michaels 1986].

Just when it was being felt that the PBC hypothesis had lost all its punch, the mid-1980s witnessed attempts at reconciling political theory of business cycle with rational expectations [Rogoff and Sibert 1988; Rogoff 1990]. In its new form, political business cycles altered to political budget cycles with the focus now shifting to policy instruments such as transfers, taxes or monetary policy. While the works of Rogoff and Sibert reconciled opportunistic political business cycles with rational voters, that of Alesina (1987) put forth a rational model for partisan parties. Some of the more recent studies, which have tried to empirically test this second generation PBC model, are Richards (1986); Davidson, Fratiani and von Hagen (1990); Alesina, Cohen and Roubini (1993); Blais and Nadeau (1992) and Suzuki (1994). Some have employed a time varying parameter (TVP) model.

In the present study we make an attempt at examining the political budget cycle hypothesis advocated by public choice

FIGURE 3: DEVELOPMENTAL EXPENDITURE ON REVENUE ACCOUNT

FIGURE 4: CENTRAL GOVERNMENT SUBSIDIES

theorists and see if this explanation does go some way in enhancing our understanding of the fiscal process, or more precisely, understanding the increasing levels and the changing composition of government expenditures in the Indian context.

II Methodology

Before proceeding to the details of our experiments we wish to point out the data for fiscal variables have been obtained from 'Finances of Central Government' published annually in the *RBI Bulletin*. Certain discrepancies were detected in the data due to definitional changes made at various time points. In order to restore comparability of data over the entire time period some data reconciliation was made. Thus, the final figures used in the study may differ from those published in the various issues of the *RBI Bulletin*. Details regarding these appear in Lalvani (1997). The variables under study all pertain to the central government.

One common feature of electoral models in most of the earlier studies is that they generally tested the hypothesis by estimating reduced form equations for macro-economic outcomes and macro-policy variables. These tests typically looked for very restricted four year patterns in outcomes and policy—sharp 'blips' in some arbitrary period near elections. In a 1989 study by Haynes and Stone, which appeared in *Review of Economics and Statistics* they pointed out that such dummy variable tests are especially non-informative in case of macropolicy variables. They therefore suggested a method where they specified 16 dummy variables (one for each quarter in the presidential electoral term) as the explanatory variables. With the intercept suppressed, the coefficients of each of the dummy variables would represent the mean values of each of the dependent variables for each quarter of the

electoral term. A plot of these coefficients would then represent the electoral pattern of the dependent variable. This methodology has a distinct advantage over its predecessors in that it does not impose arbitrary restrictions on our estimates of electoral patterns.

The data set for the present study spans the period 1950-51 to 1997-98. In connection with election years, it may be noted that it is customary to speak of elections in terms of the calendar year. However, as data for all our policy variables are available for fiscal years, we felt the necessity to slot each of the elections considered into the appropriate fiscal year. In case of any spillover of the duration of an election into the next financial year, it is the starting date of the election which has been considered for the appropriate slotting (as in the case of the 1956-57 election). The Table gives the calendar and the appropriate financial year for each of the elections in our sample.

From the Table it is seen that early elections were called in 1971 (i.e. 1970-71), 1980 (i.e. 1979-80), 1991 (i.e. 1991-92) and 1998 (1997-98), while elections were delayed in 1977. With five of the twelve elections in our sample period not being held on schedule we had to go about defining our dummy variables with utmost caution. Our dummy variables were defined in the following manner –

- DU1 : 1, one year after previous election and if it is not an election year; 0 otherwise;
- DU2 : 1, two years after previous election and if it is not an election year; 0 otherwise;
- DU3 : 1, three years after previous election and if it is not an election year; 0 otherwise;
- DU45 : 1, four or five years after previous election and if it is not an election year; 0, otherwise;
- DUM : 1 in election year; 0, otherwise, i.e. if it is not an election year.

TABLE: ELECTION YEAR AND FINANCIAL YEAR

Dates for Lok Sabha Elections	Financial Year Recorded as Election Year
Oct 25, 1951 – Feb 21, 1952	1951-52
Feb 24 – June 9, 1957	1956-57
Feb 16 – June 6, 1962	1961-62
Feb 15 – Feb 28, 1967	1966-67
March 1 – March 13, 1971	1970-71
March 16 – March 20, 1977	1976-77
Jan 3 – Jan 6, 1980	1979-80
Dec 24 – Dec 28, 1984	1984-85
Nov 22, 1989 – Nov 26, 1989	1989-90
June 12, 1991– June 15, 1991	1991-92
April 27 – May 30, 1996	1996-97
Feb 16, 1998 – April 26, 1998	1997-98

DU45, a dummy variable indicating a combination of fourth and fifth year after previous election was so defined because DU5 (i.e. five years after previous election and 0 otherwise and if it is not an election year) was mostly captured either by election dummy DUM or by the other dummies wherein elections had been preponed. DU5 was capturing the effect of only one delayed election, i.e., 1976-77). A combined dummy DU45 therefore seemed a better alternative.

For each of the macropolicy variables regressions of the following form were run using simple OLS technique.

$$Y_t = \alpha_0 Y_{t-1} + \alpha_1 DU1 + \alpha_2 DU2 + \alpha_3 DU3 + \alpha_4 DU45 + \alpha_5 DUM \quad \dots(1)$$

where, Y_t is the macropolicy variable of interest, and Y_{t-1} is the lagged policy variable, which captures the dynamic impact of policy variables. DU1....DU45 and DUM are the dummies as specified earlier.

It may be noted that equation (1) above is not evaluated as an explanatory equation, rather it is only the coefficients of the dummy variables that are the focus of our interest. The coefficients of each of the dummies are plotted separately for each variable in order to be able to track the behaviour of that variable over the electoral terms.

III

Budgetary Variables

Our study takes up each macropolicy variable individually. Each of the variables considered is a proportion of GDP. GDP was simply used as a scaling factor. Each of the variables is regressed on DU1....DUM, coefficients are plotted and the behaviour pattern observed. From our results we are in a position to infer whether the incumbent politicians have behaved in an opportunistic manner in and around election years as regards that particular variable.

Revenue Deficits: Revenue deficits refer to the gap between expenditures and receipts on revenue account. It is thus representative of the excess of expenditures over receipts on revenue account. Current expenditures are equivalent to consumption and do not result in creation of assets. Revenue deficits as a proportion of GDP would be expected to be high in pre-election and election years and to fall in post-election years. The behaviour pattern of revenue deficits spanning the electoral term seems to vindicate the political budget cycle hypothesis.

Figure 1 plots the coefficients of the electoral dummies obtained from estimating equation (1) using the OLS technique. We find that revenue deficits show a fall

FIGURE 5: EXPENDITURES ON CAPITAL ACCOUNT

FIGURE 6: DEVELOPMENT EXPENDITURES ON CAPITAL ACCOUNT

FIGURE 7: TAX REVENUE

FIGURE 8: COMPLIANCE IN TAX REVENUE

FIGURE 9: COMPLIANCE IN UNION EXCISE

FIGURE 10: COMPLIANCE IN CORPORATION TAX

up to DU2. From then on it continues on an upward trend. A sharp increase is noticed in the election year itself, indicated by the variable DUM. The story that this figure tells is that for the first two years after elections have been won the incumbent party does things right by keeping a tight leash on expenditures on revenue account and collecting as much revenue as possible from tax and non-tax sources. However, having crossed this point the incumbent party, wherever possible, makes every attempt to re-allocate its resources in a manner that will help it increase its vote bank, with little or no consideration given to the long-term impact of these measures. Such populist policy measures can only be those which will result in increases in current expenditures and cuts in receipts thus causing the mismatch, given by revenue deficits, to mount just prior to and in the election years. The behaviour pattern of this variable seems to vindicate the PBC hypothesis of governments indulging in populist policies purely for electoral gain.

Revenue deficits, the computed measure of the gap between expenditures and receipts on revenue account does tell us that the mismatch worsens with approaching elections but does not make explicit whether it is expenditure increases or receipts cut that cause the revenue deficits to widen with approaching elections. To

know which of the two routes is followed by the incumbent party we need to analyse expenditures and receipts (on revenue account) separately.

Expenditure on revenue account: This category comprises expenditures incurred on goods and services for current consumption. These expenditures are easily targeted to specific groups and hence are readily made use of by the incumbent parties to enrich their vote bank. For evidence of opportunistic strategies being resorted to at election time one would expect to witness an increase in revenue expenditures in pre-election and election years and a decline in post-election years (Figure 2).

Revenue expenditure shows a steep fall for the first three years after elections and then begin to rise, as is to be expected if the incumbent party does indeed indulge in opportunistic election time manipulation of this expenditure category. However, the election year dummy DUM registers a decline compared to the year prior to the election year.

On the face of it this result seems to contradict the PBC hypothesis but with revenue expenditures comprising developmental and non-developmental expenditures, each differing with respect to visibility, we were almost certain that a clear picture of election time manipulations would emerge when the two categories

ries of revenue expenditures are separately examined.

Development expenditures on revenue account: Developmental expenditure on revenue account comprise expenditures on the following categories:

- (A) Social and community services: (1) Education, art, culture, social service and research; (2) Medical and family welfare and public health; (3) Labour and employment; (4) Broadcasting;
- (B) Economic services: (1) Agriculture and allied services; (2) Industries and minerals; (3) Foreign trade and export promotion; (4) Water and power development; (5) Energy; (6) Transport and communication; (7) Science, technology and environment
- (C) General services;
- (D) Grants to states for development purposes; and
- (E) Disbursements of union territories.

These expenditure categories are those that have a greater element of discretion involved and hence are more susceptible to manipulation in and around elections. Developmental expenditures on revenue account are crucial vote getters for the incumbent party as these expenditures are extremely visible and also its benefactors are easily identified. Figure 3 clearly shows that there is some election time manipulation as the graph shoots up in the election year.

These results make it amply clear that in election years governments have directed large amounts of the available resources towards developmental expenditures which are more visible and more likely lure the voters to cast their votes in favour of the incumbent party.

Subsidy: A powerful weapon in the armoury of the incumbent party, a component of expenditure on revenue account, which it can exploit to its advantage for enhancing its vote share, is 'subsidies'.

Figure 4, which traces the behaviour pattern of subsidies over the electoral term clearly vindicates the political budget cycle hypothesis. Subsidies as a proportion of GDP shows a fall only in the second year of the electoral term and from then on a continuous rise is recorded with a sharp increase in the election year.

Expenditures on capital account: The distinguishing feature of expenditures on capital account is that it is incurred at one point of time while its benefits are realised at different points of time in the ensuing years. In other words, immediate visibility of this expenditure category is not to be expected. Hence, from the politicians' point of view incurring capital expenses is not a very attractive proposition in pre-election and election years.

FIGURE 11: GROSS DOMESTIC DEBT

Figure 5 shows an upward trend for the first three years into the electoral term but from then on it shows a falling trend and is more or less stable in the run up to the election year. This behaviour pattern once again shows that election time considerations do come into play.

Developmental expenditures on capital account: This category of expenditures comprises capital expenditures under the same heads as were listed under developmental expenditures on revenue account and clubbed broadly as social services, economic services, general services and disbursements to union territories.

As was the case with expenditures on revenue account, developmental expenditures on capital account too are more susceptible to discretion and, therefore, more amenable to manipulation by policymakers who use it just before elections to enhance their popularity. Also, this expenditure category, like developmental expenditures on revenue account, is more 'visible' to the voter. For instance, the starting of the construction of a school or a hospital is bound to make the party in government look 'good'.

Figure 6 shows a high level of expenditure in the first year of the electoral term. It keeps falling till three years into the electoral term (till DU3), shows a sharp rise till DU45 and a further marginal increase in the election year itself.

Tax revenue: Receipts on revenue account comprise tax and non-tax revenue. Going by the political budget cycle hypothesis one would anticipate that tax revenue would fall in election years. The result obtained vindicates the PBC hypothesis (Figure 7). The one way that people in governments could possibly grant favours as far as tax revenues are concerned is by allowing sections of people to get away with tax evasion and not enforcing compliance. A direct check of compliance was obtained by computing the difference between accounts figures and the budget estimate. This difference was then regressed on the dummy variables and its behaviour pattern examined. Further, it was our hunch that maximum benefit could be got by allowing tax-payers to get away in case of union excise and corporation tax. Compliance for both these taxes was

FIGURE 12: RESERVE BANK CREDIT TO GOVERNMENT

also examined. Results obtained are shown in Figures 8, 9 and 10.

Gross domestic debt: The gross domestic debt of the central government comprises: (A) Internal debt – (i) market loans, (ii) market loans in course of repayment, (iii) special floating loans, (iv) treasury bills, (v) compensation another bonds, (vi) special securities issued to RBI (vii) special floating and other loans; (B) Other liabilities – (viii) small savings, (ix) provident fund, (x) reserve funds and deposits.

The ramifications of a mounting debt-GDP ratio in the Indian context have been discussed of at length in a large number of studies [some of the well known contributions in this context are Rangarajan et al 1989; Bhattacharya and Guha 1990; Bhattacharya 1992; Buitcrand Patel 1994]. A high debt-GDP ratio implies large interest burden, which in view of the constraints on raising direct taxes and the limited scope for lowering current outlays may cause budgetary capital outlays to be squeezed. What is evident from this chain of undesirable repercussions of an expanding debt-GDP ratio is that its impact is visible to the voter only with a time lag. Hence, it is only natural for the incumbent party to resort to large scale debt financing around election years. The plot obtained is shown in Figure 11.

We find that a continuous downward trend is maintained right up to the pre-election years. It is only in the election year itself that the gross domestic debt is seen to increase. This seems to indicate that debt financing is resorted to in election years as the full impact of it would occur only with a lag.

Net RBI credit to the government sector: In addition to taxation and borrowings the third mode of financing of deficits that is available to the government is to borrow from the RBI. Net RBI credit to the government sector is the conventional measure of increase in money supply. In accordance with the PBC hypothesis expansion in net RBI credit, as a proportion of GDP, would be expected in election year as the inflationary impact is expected to become evident only with a lag. Figure 12 gives the plot obtained for this variable. We find that Reserve Bank credit

FIGURE 13. GROWTH RATE OF FOODGRAIN PRICES

as a proportion of GDP is very high at the beginning of the electoral term (i.e., DU1). A falling trend is seen till the third year into the electoral term. From then on an upward trend is maintained. The figure indicates to us that governments have resorted to monetisation of its deficits in election years. This mode of financing deficits around election time is bound to be very appealing to people in government since its adverse effects would become evident only with a lag, by which time the election process would have been completed.

III

Non-Budgetary Variables

Having found rather convincing evidence in support of the political budget cycle hypothesis as far as budgetary variables are concerned, we were curious to examine if a similar kind of pre-election time manipulation took place for some of the other variables which, we felt, were likely to stand the government in good stead around election time. These variables that we decided to examine included growth rate in foodgrain prices, growth rate of procurement prices in both paddy and wheat. We report below the expectations and the results obtained for each of these three variables.

Foodgrain prices: There is a popular viewpoint among a growing section of economists that inflation in India reflects inter-sectoral relative price adjustments. These 'structuralists' strongly believe that in the Indian context inflationary pressures are generated if agricultural production grows slower than the required rate. Agricultural prices are demand determined while industrial prices are cost determined. If agricultural growth falls short of the required growth, the necessary relative price shift in favour of agriculture can come about only via an increase in agricultural prices. Industrial prices rise with a lag since agricultural prices raise industrial costs directly, via increased raw material costs and indirectly, via reduced disposable incomes and, therefore, reduced demand for industrial products. Thus, in the long run, relative price adjustments are manifested in a rising price level. To check for evidence of these changes at election

FIGURE 14: GROWTH RATE IN PROCUREMENT PRICE OF PADDY

time we examined the prices of foodgrains.

Considerable amount of controversy exists regarding the indicator which best represents the price for foodgrains that the farmers receive. While a large number of authors have made use of wholesale price indices (WPI), there are others who have argued that it is not the appropriate measure due to the fact that wholesale prices are simply an average of all 12 months, thus ignoring the pattern of market arrivals during different months. These studies suggest that the use of farm harvest prices serve as a better proxy for prices received by farmers because these harvest prices are an average of wholesale prices prevailing during peak marketing season [Tyagi 1988]. Vittal, however, contested this belief [Vittal 1986]. It was her contention that farmers do not sell their surplus at harvest. According to her, the farmers hoard the surplus produce, selling maximum in the lean season to benefit from high prices. Farm harvest prices therefore would misrepresent the prices received by large farmers.

For the purpose of the present study we preferred to conform to the traditional annual growth rate in the WPI for foodgrains. Our hypothesis with regard to foodgrain prices is that around election years foodgrain prices would not be permitted to show any substantial increase as it is likely to spark off an all round increase in prices which is undesirable with elections round the corner. Figure 13 plots the coefficients for the equation with foodgrain prices as the dependent variable.

Figure 13 shows that growth rate in foodgrain prices is extremely high in the first year of the electoral term. It falls sharply in the second year (i.e., DU2). The prices rise to some extent in the third year but from then onwards it continues to remain more or less stable till the election year. Sen and Vaidya (1996) who find that the election dummy is insignificant (in equations (3) and (4) of their study) with agricultural prices as their dependent variable suggest that expansionary demand side policies followed by the incumbent party not leading to an increase in agricultural prices, could be attributable to the fact that the "government has acted to neutralise the demand pull effects of in-

FIGURE 15: GROWTH RATE IN PROCUREMENT PRICE OF WHEAT

creased budget deficits by an appropriate commodity stabilisation policy (such as increased import of foodgrains or running down of buffer stocks). Since a large proportion of the Indian electorate are net buyers of food (including a section of farmers) and since food constitutes a large component of the average consumer's expenditures, it would be in the interest of the incumbent party facing an election to insulate the electorate from any increase in foodgrain prices" [Sen and Vaidya 1996:2026].

Procurement prices for paddy and wheat: While on the subject of foodgrain prices, we thought it would be interesting to look at the behaviour pattern of procurement prices via which, it is strongly felt, the Indian government has sought to appease the farm lobby. Balakrishnan (1991) speaks of the procurement prices being fixed at levels higher than those recommended by the Agricultural Price Commission. According to him, the pressures involved in their fixation varies from region to region and over time depending on political factors like clout of producers as a group and economic factors such as changes in the structure of prices. Mitra (1977) has been very forthright in pointing to the non-economic factors and the pivotal role that they play in the determination of procurement prices. According to him, an increase in the level of official procurement prices by a certain proportion has acted as a signal for a spurt in open market prices by a similar proportion. Mitra (1977) is of the opinion that each shift in the terms of trade in favour of farm products has contributed to the holding power of surplus farmers and traders enabling them to bid for still higher prices in the subsequent season. In the words of Mitra (1977:110-11), "The policy of liberal monetary advances made to this section of the farming community under new agricultural strategy has imparted an additional bullishness year after year to market prices for farm products, so that even larger-sized crop has not led to a decline in prices, but its opposite."

The procurement price is an administered price. The Agricultural Price Commission recommends the procurement price for a particular year, but its fixation

is a matter of government policy. It has generally been noted that the recommendations of the commission have been flouted and prices have been set at higher levels by the government for the two principal foodgrains in the Indian economy, viz, rice and wheat (due to a continuous series for prices of rice not being available most studies make use of the procurement prices for paddy). Figures 14 and 15 give the relevant plots.

We find that the growth rate in procurement prices for paddy dips in pre-election years but shows a rise in the election years itself. Contrary to this, the growth rate in procurement price of wheat in the pre-election year records an increase but falls in the election years. These results seem to indicate that in election years it is the rice growing community that our politicians aim at winning over more than the wheat farmers' lobby. This might, at the first instance seem a slightly discomfiting result, for it is well known that the terms of trade which have shifted in favour of wheat is primarily a reflection of official policies. Also well known is the fact that the upward adjustment in procurement prices for rice is less than for wheat [Mitra 1977]. However, our result would not appear to be completely misplaced when we consider the fact that paddy cultivation is geographically diversified considerably. Also, marginalisation of land holdings is significantly more in case of paddy cultivation than in case of wheat cultivation, thus involving larger number of people in paddy cultivation. The story that our results seem to tell is that while the government does attempt to appease the more powerful wheat lobby in pre-election years via its procurement price policy, the growth rate of which reaches its maximum one to two years prior to elections (DU45), in the election year itself it is the larger number of rice growers that seems to matter more. Such 'foresight' on the part of our politicians is indeed remarkable, for they seem to realise that although the economic power of rich wheat growers far exceeds that of the rice cultivators, ultimately each person has only one political vote. Our politicians seem to realise that the votes of the larger number of rice cultivators would prove to be more advantageous at election time, for it is numbers alone that can win elections.

IV Summing Up

The results of our exercise provide us with ample evidence to conclude that the broad picture which emerges is one of re-allocation of available resources in and around election time towards those expenditure categories which would help

capture votes. The somewhat lower RMSPE in case of the forecast errors obtained from the politico-economic model provides us with evidence that incorporating political variables does seem to provide us with additional insights when modelling economic variables.

We would, however, like to clarify that by no means is it the intent of our study to pronounce politicians as guilty of being opportunists. In fact, the very essence of public choice approach and the political budget cycle hypothesis, in particular, is to show that indulging in election time manipulation of policy instruments is an act of rationality on the part of the incumbents. The only message that we wish to convey via this study is that, given that such election time manipulations are rational for politicians it is up to the voter to see through these 'strategic but rational' moves of politicians.

A Tragedy of Betrayals

Questions Beyond the LoC in Kashmir

K M Seethi

THE article by Bharat Karnad, 'Using LoC to India's Advantage' (*EPW*, July 10-16), makes disturbed reading. We are not too unfamiliar with the arguments he marshals in that provocative analysis, but the context is very important and the implications of the "activist policy" he suggests bode ill for peace and democratic initiatives in south Asia. Even as the Kargil operations were under way, we heard incessant calls for a crossing of LoC to inflict serious damage on Pakistan's capability and position. The Sangh parivar was not alone in making such demands for an across-LoC operation, including the use of nuclear weapons to teach Pakistan a lesson. The entire defence think-parivar, ex-army officers, and former diplomats also brought in similar arguments in favour of a 'territorial aggrandisement' which India was called upon to undertake in pursuit of the retreating intruders and militants. Karnad says that India and Pakistan "are left with only two alternatives: go to war and risk an attendant catastrophic now that the milieu is nuclearised, or engage in low-level but sustained military actions...aimed at continually enlarging the real estate in one's possession, and establishing newer lines of control" (p 1869).

This belligerent position, which he claims would "satisfy the punitive mood of the people and advance Indian interests in Kashmir", is certainly fraught with dangerous consequences. It is not only unrealistic and baneful in strategic/military terms, but devoid of any political wisdom and maturity. It once again underlines the fact that our defence think-tanks have become increasingly obsessed with militarism and are incapable of addressing the fundamental problems of our polity beyond the limits set by Chanakya sutras.

Ostensibly, Karnad proceeds on the assumption that Kashmir is just a property dispute between India and Pakistan, and that territorial aggrandisement could, at best, be an answer to Pakistan's 52-year long struggle to grab Kashmir militarily and otherwise. His argument that we should now provide a "negative incentive" to Pakistan "to settle along the desired line" (as "positive incentives" have failed), gives

an impression that all is well with India and the only bane of our existence has been Pakistan. This is a one-sided assessment of the problem, the real dimensions of which need to be placed in a broader psycho-historical setting of India's 'holier than thou' approach and Pakistan obsessions. One does not dispute the fact that the task of the military (though belated, as it were) was enormous, and it did succeed, in driving out the Pakistan-backed intruders and militants. But underneath this conflict, there is a fundamental question of Kashmir which hardly emerges in our daily national security discourses. Can we any longer leave aside this question for the sake of convenience?

If we analyse the conflict within a broader socio-historical background, we will certainly come across a spectrum of uncomfortable realities. These realities persistently escape our attention due to a perceived reason/fear that it might threaten our national loyalty and put our patriotism to a hard test. This false consciousness again and again dampens our intellectual curiosity to know things from another angle of the question and our search for a political solution to the conflict. The defence think-tanks always look at such issues from strategic/military point of view devoid of any political insight. The question is certainly larger than national security and territorial integrity, larger than international diplomacy and cross-border terrorism. The Kargil conflict should necessarily awaken us from our deep slumber, from our self-imposed intellectual censorship which extended beyond 50 years.

Kargil and Kashmir are inseparably interlinked, and the ultimate and terminal points of this question should not be located along the LoC (or beyond the LoC, as Karnad suggests), or ended with securing a favourable international public opinion, as against Pakistan's sinister campaign across the world. The ultimate solution lies not in finding out the best possible military strategy, in the manner in which Karnad puts forth, but in developing a mature political option which will deliver good to the people of Kashmir who have been driven from pillar to post during the

last 52 years. Unless we are able to do this, we will have to face more Kargils, more intrusions, more cross-border tensions and, perhaps, the worst scenario of human rights violations and abuses in Kashmir. But this should not be interpreted to mean an appeal for demilitarisation in the face of Pakistani attacks and cross-border tensions. That is an entirely different question and should be addressed as such. However, we have absolutely no substitute for a mature democratic solution to the current conflict in Kashmir.

We have heard enough of the institutional/organisational lapses in taking adequate measures to prevent cross-border intrusions during the last 10 months. Poor Brig Surinder Singh, commander of the Kargil-based 121 Brigade, has been made a convenient scapegoat in this, whose forebodings, if taken in right earnest, would have saved many lives and crores of rupees. But underneath this outward lapse, though serious as they were, there is the basic lapse of the Indian state which has a history of more than half a century. This fundamental lapse has been sustained by all successive governments, and the media and political parties are equally responsible for these lapses. Every time the rhetoric of 'unity and integrity' and of combating militancy and communalism tended to dilute, if not divert, the basic democratic question in Kashmir. We have certainly come of age to transcend this sort of false consciousness and nationalist pretensions. However, this should not lead us to the conclusion that all is well across the LoC, in the state of Pakistan. It is a nation in perpetual struggle for identity as the people are increasingly alienated due to the political machinations of the oligarchic power structure of the Pakistani state. The successive regimes in Pakistan who lacked legitimacy and popular mandate tried to overcome and externalise their internal contradictions by appealing the masses to the 'unfulfilled mission' in Kashmir.

Sadly enough, the enmity of 'the other' or hostility with 'the other' has deeply entrenched itself in the blood of an average Indian and an average Pakistani. This built-in antagonism has been perpetuated for more than 50 years and, unfortunately, it gets legitimised with more Kargils and cross-border tensions. As the encounters between the two irreconcilable identities take place in a variety of forms, they conveniently forget that the terrain of this confrontation has long been inhabited by a population whose democratic aspirations

and secular credentials were never disputed but have been placed for scrutiny in recent times. We are not worried at all that the very survival of the Kashmiris gets caught in the irreconcilable rivalry between Indian and Pakistani state whose betrayals and involvements only alienated and marginalised them. The civil society living on both sides of the LoC is only a victim and passive spectator in this high tension drama, incapable of influencing the course of events.

As we proceed to look at the antecedents and implications of the Kargil conflict, we inevitably encounter four betrayals, each of which contributed in its own way to the accumulation of tensions and conflicts. The first and foremost betrayal came from imperialism itself. Britain, at the beginning, and the US subsequently played a decisive role in driving a wedge between India and Pakistan on the Kashmir question. It is precisely for this reason that we must be extremely cautious when they reassure their mediatory/honest broker role in the current conflict. If at all Pakistan scored any victory on the Kashmir question during the first decade of independence, as many would have us believe, it was with the open support and assistance of these imperialist powers. No wonder, when the two giants of the imperialist camp traded arguments against India in the UN and elsewhere, India felt isolated and alienated. Nehru was forced to say, after the bitter experience in the UN, that the world body was controlled by the 'Anglo-American racket'.

Many thought that imperialism would, at last, withdraw from the subcontinent with the emergence of India as a major power in the post-Shimla period. But imperialism reappeared in different forms, including one of patronising fundamentalism and militancy in the region. The most decisive period came when General Zia ruled Pakistan. He was the most trusted policeman of the US in the region, particularly after the fall of the Shah of Iran and the Soviet intervention in Afghanistan. Pakistan became not only a frontline state in America's south Asian strategy but a safe haven for all tribal-religious militant outfits. The mujahideens stationed across the Pak-Afghan border had received all material and moral support from both the US imperialism and the authoritarian regime of Pakistan. Though imperialism had apparently lost interest in Afghanistan in the post-Soviet withdrawal period, it continued to support the Islamic fundamentalist groups, culminating in the installation of a Taliban regime in Kabul. Thus, the hands of both Pakistan and the

US were quite certain and critical in perpetuating militancy and fundamentalism in the region. Even the Islamic militants in Kashmir had received considerable support from the US and Britain at a certain stage. It is in this background of long years of imperialist betrayal and involvement that we must place Pakistan's aggressive posture and the US role in the current crisis. We must also look at the sincerity of the proclaimed US opposition to Islamic fundamentalism and militancy with greater caution, particularly in the post-Kosovo global scenario. The Nawaz Sharif-Clinton joint statement is certainly deceptive. We may think it is advantageous to India, but the implications are not palpable enough.

Secondly, Pakistan betrayed the democratic secular aspirations of the

Kashmiris by taking over a part of J and K way back in 1947-48 and imposed authoritarian political and military structures all these years. The cultural unity and communal harmony across the LoC have been considerably disrupted with frequent interference and militarisation of the Azad Kashmir. Over the years, it became a safe haven of all militant activities, facilitating cross-border intrusions and terrorist activities. As Pakistan gained considerable leverage in the late 1980s with more militant organisations looming large in the valley, the Kashmiris began to face a real dilemma. They were virtually caught between the militants and the Indian and Pakistani army, which took a heavy toll over the last 15 years. Ironically, Pakistan's championing of the cause of the freedom of Kashmir betrayed itself because of its

own anti-democratic and anti-people policies and programmes not only within Azad Kashmir but in the entire state of Pakistan. Pakistan's involvement and frequent interferences only thwarted the democratic secular aspirations of the Kashmiri society. The Kargil conflict further underlined the fact that the people living on both sides of LoC cannot enjoy a peaceful and orderly life because of this continued cross-border intrusions and Indian and Pakistani military responses.

The third betrayal came from none other than India itself which has a longer history, perhaps extending to partition days. This has three distinct phases. In the first phase after accession, India's Kashmir policy did not exhibit any consistency, coverage and commitment, expected of a mature political leadership. Nehru lost courage when he failed to clear up the Pakistan-backed invaders in 1947-48 for the sake of transient goals and ill-timed international commitments. The commitment of Nehru turned out to be a great liability and subsequently a misadventure of Indian diplomacy. India really fumbled in the UN not only on Kashmir's accession with India, but on the accession of other princely states like Junagad and Hyderabad. The commitment on plebiscite was even more disastrous and the promise of a 'reference' to the people was not kept beyond 1954 because of the 'altered conditions' and geo-political realities. Meanwhile, the second phase of India's betrayal started almost parallel to this. The promise of autonomy to sustain the political sanctity of the state did not bear any fruit because of the internal tensions between New Delhi and Srinagar. Consequently, Article 370 of the Indian Constitution remained a dead letter after 1954, and whatever was offered to the people in the early phase was taken away without any consideration and political honesty. This was done through a series of constitutional amendments and presidential orders. Even though 'autonomy' became defunct in Kashmir, a belief was deliberately borne upon us that the problem of Kashmir emanated from this special privilege enjoyed by them. Even today many people attribute the cause of current militancy to the original 'sin' of granting autonomy to the people. Hence, the demand for abrogation of Article 370 without knowing, if not deliberately concealing, the fact that Article 370 has virtually become irrelevant since 1954.

This has been accompanied by a long spell of political manipulations carried on by the Indian National Congress (INC) and the National Conference (NC).

Elections in J and K were a mere farce, and almost all general elections saw extensive rigging and institutional corruption. That way, both the INC and the NC were responsible for alienating the people from the mainstream. The situation worsened when the state was completely neglected by the centre and the economy was ruined by successive governments in Srinagar and New Delhi. Unemployment increased phenomenally, industrial backwardness reached its peak, and agriculture showed no significant improvement. The objective situation in J and K was such that the people lost all faith in the Indian state. Popular discontent began to surface for the first time in the late 1980s against this background of economic backwardness, institutional corruption and people's alienation. The militant organisations who never had any mass backing in J and K found this to be a golden opportunity to make inroads into the society. Pakistan capitalised this situation and began to interpret this as a renewed case for self-determination and unleashed its sinister campaign.

The third phase of the Kashmir question started at this stage when India began deploying army and paramilitary forces in the state. The Indian military operation in Kashmir since 1989-90 amounted to widespread human rights violations marked by instances of repression and torture on an extensive scale. The encounters between the militants and the army took a heavy toll over the years and there were innumerable cases of arbitrary killings and torture by both the militants and the Indian army. Thousands of pandits were also forced to flee the valley and attempts were made to communalise the society. The very identity of the Kashmiris has been deliberately divided between Hindus and Muslims who at no point in history ever displayed any religious sectarianism in their social living. The Kashmiri alienation certainly weakened India, but strengthened Pakistan's hands.

The fourth betrayal is by the Islamic militants who drew sustenance from various regional and international sources. A major blow on the secular fabric of Kashmiri society came when they officially championed the cause of their brand of Islam in Kashmir with Pakistan's connivance and imperialist support. Cross-border terrorism and militancy grew when popular discontent in the valley ran high. Islamic militants' appropriation of the cause of the Kashmiris virtually alienated the latter, leading to further militarisation and repression by the Indian state. Thus

the plight of Kashmiris became more pathetic over the years. Their secular credentials have been destroyed, and cultural roots and identity distorted with the frequent interferences and manipulation by India and Pakistan, on the one side, and imperialism and Islamic militancy, on the other.

How do we account for this political tragedy when we are increasingly obsessed with national security issues? Are we supposed to stand united in liquidating these people? Should we show restraint when they are subjected to repression and systematic killing? Reports say that more than 40,000 people have been killed (official figures are much less) during the last 10 years in the mutual encounters between militants and the Indian army. Are we supposed to enlarge the scope of mutual extermination by militarising the entire region, as Karnad suggests? The civil society will have to address this question most seriously.

To add insult to injury, both India and Pakistan braced themselves for a nuclear showdown last year with disastrous consequences for peace and security in the subcontinent. The nuclear hawks in both countries argued that the nuclear weapons capability would restrain the two countries and that there would be mutual respect and recognition of each others' power and potentials. In fact, the Kargil conflict has easily demolished this myth of deterrence. Interestingly, when the Kargil operations were over, the very same nuclear hawks seized the argument that the nuclear weapons have greatly restrained the two countries from escalating into a major war. But they conveniently forget the fact that there was no war between 1972 and 1998, and the nuclear tests have greatly enhanced Pakistan's self-confidence in undertaking a cross-border operation in Kashmir in spite of Vajpayee's Lahore trip and the joint declaration that followed. Though it failed to achieve anything in Kargil, Pakistan was able to tell the world once again its own version of the Kashmir struggle.

The one and only option to end this human tragedy and get over the continuing dilemma is democratisation of the Kashmir society on both sides of the LoC. The most urgent task is to win over the people, not militarily, as Karnad would suggest, but through a series of mature political engagements. This certainly requires statesmanship, political honesty and courage. The alternatives to this will be frustrating and disastrous: we will have to face more Kargils, more intrusions, more mutual killings and a tragedy of more betrayals.

OXFAM HIV/AIDS INTERVENTION PROGRAMME IN INDIA

Oxfam

NATIONAL
LOTTERY
CHARITIES
BOARD

Oxfam, a relief and development agency, would like to recruit a team of three personnel to facilitate local, State, National and international improvements in the ways in which HIV/AIDS services and prevention are developed and coordinated based on learnings and existing work of NGOs and other institutions in India. The UK **National Lottery Charities Board** has kindly agreed to support this 5 year programme.

Applications are sought for the following three posts:

(1) Programme Manager – The candidate would ideally have a degree in MBBS or Public Health/MD in community health/MA in development with experiences in health sector forum, policy research/health policy analysis. S/he will provide overall leadership to the team and management of this work at the local, State and National level. The post requires a minimum of 6-8 years of development experience, preferably with NGOs, in developing and coordinating community health initiatives in India, ideally working in the field of HIV/AIDS; demonstrated impact in the field of policy analysis and development; good analytical and strategic planning skills and understanding of development issues; commitment to social justice; team management experience; familiarity with finance; ability to commission and manage research and evaluation; ability to provide training and facilitate and strengthen NGOs, CBOs and other existing civil society organisations; good administrative and communication skills; sensitivity to the inequalities facing women and vulnerable groups in society.

(2) Programme Officer – The candidate should have a degree or diploma in public health/community nursing/nutrition /development studies with 3-5 years experience of working with NGOs in coordinating health projects in rural/urban areas preferably working in the field of HIV/AIDS; public health research, policy research/health policy analysis; demonstrated analytical, conceptual and strategic planning skills; the ability to facilitate interaction between different development practitioners at various levels; demonstrated ability to work as part of a team and aptitude for project management skills – including communication, organisation, training, planning, budgeting and scheduling; ability to interact and build rapport with NGOs, donors and government personnel; demonstrate sensitivity and commitment to address gender and equity issues.

(3) Project Officer (Finance) – The candidate should be able to manage and undertake the overall administration of the team in relation to Finance and Accounts for the HIV/AIDS national programme office in line with **Oxfam's** requirements in India. The candidate will be expected to have a degree in accountancy with or at least four years of accounts management experience. The candidate should possess financial/analytical skills; ability to design, implement and refine office management systems; procedural and legal knowledge; training skills; high level of interpersonal skills; demonstrated sensitivity to address gender and equity issues.

The first two posts will require extensive travel. All candidates should possess excellent verbal and written communication skills in English and one other major language in India and computer skills. Women candidates are especially encouraged to apply. The team will be based in Calcutta. **Oxfam** offers 5 year contracts for all posts with reasonable salary and other benefits to attract competent professionals. **Only shortlisted candidates will be contacted for interviews to be held in Calcutta.**

Candidates should submit a detailed covering letter explaining fully from their experience how they meet all the criteria listed above not later than 15th October, 1999. **Applications should be sent to Oxfam (India) Trust, B-3 Geetanjali Enclave, 1st floor, New Delhi – 110 017.**

Dangerous Deficiencies

The dependence of Finance Commissions on sophisticated mathematical and statistical methods to arrive at their recommendations has led to the participatory process of revenue-sharing being devalued. Worse, it has brought in its wake obscurity, bordering on opacity, of the rationale of the commissions' recommendations. A critical review of the work of past commissions. **2725**

How Green Karnataka

Years of neglect and apathy by the government and its agencies have resulted in the overall degradation and underdevelopment of natural resources in Karnataka. While popular movements can prompt knee-jerk reactions, systematic planning is required to protect, conserve and develop the environment. A status report on the environment in Karnataka. **2735**

Theme Decline

Nirad Chaudhuri's great theme threading through all his work was decline - decline and fall of empire, of social systems and of western civilisation under the hooves of his 'three horsemen', individualism, nationalism and democracy. **2710**

Electoral Dyspepsia

The extremely poor turn-out of voters in Kashmir vividly underlines the fact that elections in the state are not serving as an effective means of articulating the political, social and economic aspirations of the people. **2703**

While it may be too much to expect peaceful polls in Bihar, the current polarisation of political forces may well turn out to be significant, with indications of a probable further redistribution of power and pelf in favour of the backward castes and the dalits. **2704**

To What End?

The recent merger of two French banks is just one episode in the ongoing rapid concentration and transnationalisation of capital which can only have disastrous effects. **2713**

No Telling Apart

The convergence of interests of the country's two major parties is an unending affair. It is only those, specially belonging to the Left, anxious to stress a sharp ideological cleavage in the behaviour pattern of the two, who are having a trying time. **2694**

Unfriendly Change

The increasing acreage under cash crops in the Hindukush Himalayas is not only leading to food scarcity and resource depletion, but decreasing agricultural productivity. **2717**

Of Banks and Bills

Efforts are called for, parallel to those taken by the Reserve Bank to deepen the money and government securities markets, to promote the market for bank-accepted bills as a major money market instrument to facilitate the financing of asset-creating activities. **2696**

Crime Country

It is not surprising that economic crimes have increased manifold in Russia since the process of liberalisation began. Embezzlement, murder, drug-trafficking and arms smuggling are commonplace today. How concerned is the government about this and what is being done? **2715**

Games Rulers Played

In the early decades of this century the princely states of India were much less isolated from the changes taking place in British India than is commonly supposed. Study of the Khilafat movement in Hyderabad documents another interesting aspect of the changing relationships between the native rulers and the British. **2745**

Tenancy Contracts

The implications of the interlocking of tenancy contracts with other markets have been explained differently by neoclassical and Marxist economists. An exploration into the best approach to explain the findings of a study in a sample of villages in Orissa. **2752**

Economic Reform Strategy

INDIA has made notable progress since 1991 on the path towards macro-economic and structural reform. Nevertheless, major economic policy challenges lie ahead to attain durable progress in social improvements and poverty reduction. It is quite warranted that the overall role of an over-extended and fiscally insolvent government in the economy is to be reduced with orientation towards effective attention to its role in poverty reduction. Raja J Chelliah's implicit suggestion ('Economic Reform Strategy for the Next Decade', September 4) that it is necessary to formulate special policies designed to protect poor self-employed persons, even though there would be some loss in efficiency, deserves appropriate attention from the policy-makers. Chelliah further points out that for sustainable higher growth that in the coming decade, the decline in the ratio of expenditure on human development to total government expenditure should be reversed. NGOs and in fact the entire middle class should constantly apply pressure on the governments to do what is good for the people in the long run. I would like to raise the point here that as the middle class is currently very involved with the ongoing reform process, local social workers who can effectively lobby with the local political agents for the adoption of a reform agenda, which would safeguard the interest of the poor, need to be encouraged much more by the society as a whole. Micro initiatives in this direction would result in desirable macro-movement.

It may not be out of context to state that while policy prescriptions help to create a conducive environment for growth, the realisation of growth depends on the operational efficiency of the various economic agents. Industrial sickness, low capacity utilisation, delay in public sector project implementation, etc, are killing industrial initiatives, as is well evidenced by the gap between proposals for and realisation of industrial investment. The ongoing restructuring in the corporate sector, however, will yield operational efficiency in the long run. More attention should be devoted by the corporate sector, duly supported by conducive public policy,

to improve operational efficiency which ultimately helps generate growth and employment. In this regard, state policy-making bodies need to be more economic agent friendly in order to accelerate the implementation of policy changes.

Hidden Costs of Debt

THIS has reference to the article 'Andhra Pradesh: The Man and the Times' by K Balagopal (June 26). Normally, in such articles, language hides logic and rhetoric hides reason. This one is an exception to a large extent (it could have been shorter in length, though) and is indeed a very balanced account of the times.

One aspect of the times, as far as India is concerned, is the total lack of concern for the mounting external debt. The nation's external debt is close to \$ 100 billion. None seems to care about the burden such a debt imposes on the present and future citizenry. Strange as it may sound to the informed few, politicians seem to be happy that they are able to

borrow from the World Bank!

Borrowing costs are not limited to interest costs. First, there is the dependency syndrome, which leads to the development of constituencies at the various levels of government to keep the borrowing momentum in full swing, actively supported by the multilateral development agencies. Second, there is an element of uncertainty in regard to whether the loans will be available when most needed, with the uncertainty increasing in the event of any demonstration of national self-reliance in areas unacceptable to the stockholders of the lending agencies. Third, neither the civil servants negotiating the loans nor their political bosses have a direct responsibility for loan repayment, with the result that there is bound to be a relatively high degree of laxity in ensuring the best and most productive use of the borrowed funds. Fourth, there is hardly any evidence to indicate that countries with heavy indebtedness really can ever develop to such an extent that they will be free from such indebtedness.

Sour Sugar

SUGAR import from Pakistan has become one of the liveliest issues in the Lok Sabha elections. Of course, the sugar industry has been opposing import of sugar, which was put on the OGL and freed from licensing requirements in 1994, from any source on the ground that domestic production is sufficient to meet requirements. This may be true of the 1998-99 sugar season ending this month, but it is a fact that in the 1997-98 season, which is when imports gathered momentum, production was 12-15 per cent short of consumption. In response to the industry's lobbying the BJP-led government has progressively stepped up the import duty on sugar to the present level of 27.5 per cent, though industry is now demanding that it be raised to a minimum of 50 per cent. Despite the increase in sugar production to 15.4 mn tonnes in the season which is just ending and the industry's claim that the 1999-2000 season will see a further rise to 16 mn tonnes, leaving some margin over estimated consumption, there seems to be general agreement that imports have helped to keep the free market price of sugar a fifth below what it might have been. The sugar industry will claim that it is government policy which is to blame for this and there is an element of truth in this. The policy of sequestering 40 per cent of production in the form of a 'levy' is clearly serving no larger public purpose even as it is contributing to higher open market prices by withholding supplies from the market while also giving rise to a largely purposeless budgetary burden of a subsidy on 'levy' sugar.

There is a case undoubtedly for a review of the government's sugar policy, much more than for any second thoughts on the policy with regard to sugar import. But it is not these issues which have caught the fancy of political parties in the election. What has is the question of import of sugar from Pakistan, more specifically, that such import had continued, allegedly even on government account, despite the Kargil conflict. The allegation about government import of sugar has been easily disposed of with the disclosure that the relatively small import worth some Rs 10.5 crore by the government-owned Projects and Equipment Corporation had ceased by February this year. However, the linking of sugar import from Pakistan and the Kargil conflict by political parties as an important election campaign issue does raise some interesting larger questions. One of these relates to the evidently irresistible temptation of parties and their leaders to stoke hostility to Pakistan as a means of mobilising electoral support. What the election propaganda of the opponents of the BJP-led alliance is suggesting is that it was somehow unpatriotic and anti-national to have continued import of sugar from Pakistan – and by implication any sort of economic exchange and trade

with that country – in the context of the Kargil conflict. The facts are that India was never in a state of war with Pakistan and the fighting in Kargil was itself a limited affair both geographically and in terms of its duration. Yet the politicians' knee-jerk response, for which they apparently expect to win popular applause, is to put at stake the whole gamut of political and economic relations between the two countries, tenuous and stilted as they are. Is it any wonder then, given this proclivity of politicians, which is shared in equal measure by their counterparts in Pakistan, to use sabre-rattling directed across the border as a trusted method of shoring up their domestic political fortunes, that the two countries have failed over half a century to even ensure that ordinary visitors from the one to the other are treated with a modicum of decency and humanity, not to mention infuse their political and economic relations with a measure of simple good sense and rationality?

Another issue raised by the high-tension campaign about sugar import from Pakistan is the attitude reflected in it to trade and economic relations among countries sought to be propagated by our over-zealous guardians of 'national interest'. According to them, the BJP-led government was guilty of 'helping' Pakistan by allowing sugar to be imported from there even as that country was engaged in hostile military operations in the Kargil region. Notwithstanding as much the accumulated wisdom of economic science as the everyday experience of common people, politicians continue to suffer from a mental block in acknowledging the contribution of imports to national well-being by making available new, better or cheaper goods and ways of doing things. In the relatively simple case of our sugar imports, from Pakistan and elsewhere, we have been in fact helping only ourselves to keep the price in the domestic market of an essential item of mass consumption significantly lower than it would otherwise have been. But no matter, every move in the direction of making imports cheaper and more readily available has to be forcibly extracted, like a sore tooth.

A final lesson of the angry exchanges going on over the allegedly less than patriotic sugar imports is how smooth, imperceptible almost, is the interchange of ideological caps among our parties and politicians. It is the champions of secularism and votaries of good-neighbourliness who we now find pillorying the BJP and its prime minister for being soft towards Pakistan and who are now hell-bent on ensuring that the Indian external affairs minister does not engage in talks of any sort with his Pakistani counterpart when they are together at the SAARC foreign ministers' meeting in New York towards the end of this month. If ideology is rapidly being rendered a less than respectable entity, does one need to look very hard where the blame lies?

Shifting Loyalties

THE shift in the Muslim vote away from the Samajwadi Party (SP) towards the Congress, leading to a revival of the Congress in the state, has been the most discussed aspect of the Lok Sabha elections in UP. Yet the impact of this expected shift in the minority vote in undermining the poll prospects of the Congress's main adversary, the Bharatiya Janata Party (BJP), for whom UP continues to be a crucial state from the standpoint of its return to power at the centre, remains uncertain.

The Muslim vote, which plays a determining role in some 22 Lok Sabha constituencies of UP, is in all probability going to get split between the SP, the Congress and the Bahujan Samaj Party (BSP) to varying degrees. The BJP which has hardly any support among the Muslims is not directly affected by this development. In fact what the poll scene in UP shows is that the war for the Muslim vote has hotted up among the three non-BJP contestants, with the BSP, to the chagrin of the Congress, making an equally strong bid for the Muslim vote. Though largely seen as a party of the dalits, the BSP too has cultivated a Muslim constituency in UP as part of its 'bahujan' strategy since the 1980s and, gauging the mood of Muslim voters, has put up maximum number of Muslim candidates among all the parties in the state in the present elections. The BSP hopes to swing the poll outcome in its favour through a dalit-Muslim combine in quite a few constituencies where the Muslims and the dalits each constitute some 20 per cent of the population. On the other hand, the Congress is banking heavily on the return of the Muslims to its fold for its rejuvenation in the state. But in the absence of a significant shift in upper caste and dalit votes in its favour, the Congress's gain in terms of votes may fail to be converted into seats won.

Nevertheless the drift of the Muslims away from the SP has unsettled that party's calculations to such an extent that even party chief Mulayam Singh Yadav is unsure of retaining his Sambhal seat, where there is a large presence of Muslims, and is therefore contesting also from Kannauj with a predominantly non-Muslim electorate. With the BJP refusing the Farrukhabad Lok Sabha ticket to Kalyan Singh's protegee Sachchidananda Sakshi Maharaj, belonging to the Iodh community, the SP is engaged in building a tenuous

yadav-Iodh alliance with Sakshi Maharaj's help which, given the 3 per cent population of the Iodhs in the state, may not help much to reinforce the SP's weakened yadav-Muslim axis. In the end the four-cornered contests may to an extent bail out the BJP which is otherwise severely undermined by factional infighting in the context of voting patterns largely determined by caste and community loyalties.

PETROLEUM PRICES

Putting Off the Day of Reckoning

THE oil pool account is in deficit once again, to the tune of Rs 5,000 crore or more, going by news reports. This is a sign of multiple malaise – in the oil economy, in fiscal management and in the commitment of the political class to sustaining reform. It was irresponsible of the Vajpayee government not to have raised retail petroleum product prices after international oil prices began their upward march in February this year. Now, the country will have to wait till the third week of October, at least, for a new government at the centre to muster the political courage to raise product prices to cover the cost price as well as the deficit in the pool account.

Till September 1997, when the United Front government mustered the courage to begin dismantling the administered pricing mechanism (APM) for petroleum products, these prices were caught up in a web of cross-subsidies and normative pricing that killed efficiency in the oil economy and raised the economy's energy costs. Refined products were sold at retail prices fixed by the government. Oil refineries were to be paid normative prices that were meant to cover the cost of production, transportation and storage, including a 12 per cent rate of return on capital. The difference between the sale receipts and the normative revenues of the oil companies, if positive, accumulated in the oil pool account, and, if negative, flowed out of the pool account to the oil companies. If the pool account did not have funds, it went into deficit and owed the oil companies to the extent of the deficit. The pool account was obliged to pay the oil companies interest on these dues. Since a deficit could not be sustained indefinitely, the government would raise retail prices to a level that would wipe out accumulated dues including interest charges. Often, political timidity would prevent the government from raising retail prices and the pool account deficit would balloon. This happened in the final months of the

Narasimha Rao government and the United Front government inherited a huge pool account deficit. Oil prices remained high in 1996 and 1997 and the UF government estimated that the pool account had run up a deficit of Rs 18,000 crore when it decided to implement long-standing recommendations to dismantle the APM.

Getting politics out of the pricing of imported energy was not the only benefit of dismantling the APM. Under the APM, the refineries had no incentive to cut costs and had every incentive to boost costs. Insufficient port capacity to handle imports resulted in killer demurrage payments but these turned no hair at the Indian oil majors because these costs were a pass through. The APM discriminated against depreciated, older refineries and encouraged newer refineries to pad costs. Regulated marketing at fixed prices meant that refineries had no incentive to improve quality either. Gross price differentials between similar distillates led to large-scale adulteration of fuels, contributing to greater engine wear and tear, pollution and low fuel efficiency. In a situation where refineries compete to sell products, they would cut costs, offer the best possible price and quality. But for that to happen, the APM had to be dismantled. The APM could not be dismantled so long as the oil pool account owed the oil companies money – the government could not spare budgetary resources to pay off the oil companies' dues before setting them free to compete amongst themselves on price and quality.

An inefficient oil economy is not the only consequence of the APM and attendant oil pool account deficits. There is a macro-economic problem as well, similar to that of a widening fiscal deficit. In combination with a revenue account deficit, a gross fiscal deficit signifies that the government is cornering credit that should go to finance production and utilising it to finance consumption. When the government and the private sector compete for loanable resources, interest rates go up. When the government thus appropriates a larger share of total savings than the private sector is willing to surrender to it, inflation and worsening of the current account deficit result. This destabilising effect of government borrowings stems from not just the gross fiscal deficit of the centre or the combined deficit of the centre and the states, but from the gross public sector borrowing. This measure includes, apart from the combined deficit of the centre and the states, borrowings by public sector undertakings and off-budget borrowings such as the oil pool account deficit.

When the oil companies do not get their dues from the pool account, they borrow from the market, diverting a large chunk of credit to finance an irrational subsidy, exactly as the fiscal deficit does. Any way you looked at it, the APM had to be dismantled.

The UF government set off the APM dismantlement, with a bit of financial engineering. It bought over the oil companies' dues from the oil pool account. Henceforth the refineries would receive import parity prices for the products they sold. But retail prices would still reflect the government's intention to subsidise certain classes of consumers and the government budget would bear the subsidy burden, raising the needed resources from oil taxes. Where did the government get the money to buy up the oil companies' dues from the pool account? It issued special oil bonds. Who subscribed to the bonds? The oil companies themselves. The bonds would be redeemed from future inflows into the pool account, as the new, higher retail prices raked in a surplus. Retail prices would be adjusted every month, to preclude any possibility of a fresh deficit building up and to maintain a positive inflow into the pool account till the oil bonds could be redeemed in full. Once the oil bonds are redeemed, there is no further need for administered prices and full market pricing could be resorted to.

Differential pricing of petro-products could be retained through differential taxation of the products, but this would affect consumption patterns without depriving the oil companies of an incentive to cut costs. Now, this piece of financial engineering left the gross public sector borrowing requirement unchanged, but the oil companies now had an incentive to cut refining costs; their sale price would be fixed at import parity, and if they could increase the refining margin, they could boost profits. However, full-fledged competition and cost cutting in all segments of transportation, storage, refining and marketing awaits the final redemption of the oil bonds and freeing of petro prices from administrative control.

However, after December 1997 oil prices began a steady decline that continued till February 1999 when, at \$10 a barrel for crude, they were, in real terms, below the pre-1973 oil shock levels. This was a bonanza, since the government did not reduce retail prices anywhere near in proportion to the fall in international prices. Funds flowed into the oil pool account and the government has redeemed all save Rs 400 crore of the original Rs 13,000 crore worth of oil bonds issued. (The estimated

deficit of Rs 18,000 crore reduced to Rs 13,000 crore because of the fall in crude prices). This made it possible for the government to advance the date of freeing oil prices from administrative control.

But the government's luck did not hold for long, and since February this year oil prices have more than doubled till date. It was crucial to raise domestic retail prices to ensure that they did not fall below costs, for the APM dismantling process to proceed apace. But political chicken-hearts in the government reneged on the policy commitment. Retail petro product prices are below import parity and the pool account is accumulating fresh dues to the oil companies. To undo the damage, future hikes in petro prices will have to be that much steeper than what is needed to attain parity. This shows the BJP's commitment to reform in a poor light, especially when compared to the less bombastic United Front government's willingness to push through politically unpalatable decisions in the larger interest of the economy.

POLITICS

The Caste Card

A correspondent writes:

EVERY time elections are held in India, caste divisions, superstitious beliefs and all the regressive trends that keep the country backward are reintroduced and reinforced by the leaders of different political parties. While the traditional religious animosities that divide our society are somewhat kept at bay during elections because of the ban on religion-based campaigns by the Election Commission, no such check is to be noticed in places where castes are equally matched and contests are held purely on caste lines.

What is further revealing is that while the national political parties may not be identified with particular castes at the all-India or even the state level, their candidates play the caste-card in their constituencies by appealing to their respective caste sentiments. In the election campaign, the political differences between the contesting parties which are represented by their nominees are glossed over, and caste loyalty is made the sole criterion for electing the candidate. As a result, we find candidates of the same party appealing to one caste in a certain constituency, and a different one in another. In the national capital, for instance, during the present election, in one part of the city a BJP candidate (a former chief minister of Delhi) was trying to rally all the followers of his

jat caste asking them to forget their political differences and vote for him as a jat candidate since he alone would be able to further their interests as a caste. In another constituency at the same time his party comrade was found appealing to members of the rajput caste to vote for him to enable him to represent them and address grievances that may be specific only to the rajputs. Even the national leaders of these parties, when visiting the constituencies of their candidates, take care to appeal to caste sentiments. Thus, during the last assembly elections in Rajasthan Congress leaders wooed the jats by promising them reservations in jobs. This time, during his election visit to Rajasthan, prime minister Vajpayee also promised reservations for jats in a bid to win over this influential vote-bank. The phenomenon is not peculiar to the north. In Bellary in Karnataka, both the Congress and the BJP have worked hard on the divisions between the vokkaliga and the lingayat castes in order to garner votes for their respective candidates, Sonia Gandhi and Sushma Swaraj.

While the age-old caste divisions in society tend to get ossified by such appeals to caste loyalties during election campaigns, traditional superstitious beliefs are revived through other means by candidates. Astrologers are wooed by leaders of almost all the parties. The candidates wait for the right auspicious hour to file nomination papers. 'Yagnas' are held to propitiate the gods to help them win the elections. Visits to religious shrines and local godmen to seek their blessings are a must for candidates during campaigns in their constituencies. Some even play on the superstitious beliefs of the electorate to win their votes. According to a newspaper report, in one constituency, a BJP candidate had been propagating against the Congress and its leader Sonia Gandhi by exploiting a belief current among the tribals there that a widow is a bad omen for both the family and the country.

Such acts may not fall under the axe of the hyper-active Election Commission, but they do legitimise irrational beliefs and practices that are the bane of our society, and are in contravention of the fundamental duty, as laid down by our Constitution, to "develop the scientific temper, humanism and the spirit of inquiry and reform". Should not the Election Commission intervene to stop campaigns that appeal to sentiments of casteist chauvinism or superstitious beliefs, which are as divisive and retrograde as campaigns based on religious appeal that are banned by the commission?

CURRENT STATISTICS

EPW Research Foundation

FII investment followed by net disinvestment to book profits (and in response to rise in short-term US interest rates) have begun to dominate share price behaviour. With gross FII purchases of Rs 4,311 crore and net purchases of Rs 1,504 crore in July, the Sensex shot up from 4145 in early July to 4603 towards the end of the month. With lower gross purchases of Rs 2,714 crore (and net sale of Rs 122 crore) the index has gyrated and once even dipped to a low of 4488 in August. The index has again receded from a peak of 4906 to 4641 following FIIs' profit-taking in September.

ITC

Up the Value Chain

CIGARETTE major ITC fared well in 1998-99, notching up a 24.5 per cent increase in its operating profit on 11.9 per cent higher net sales. Despite sharp increases in interest charges (up 43.1 per cent), depreciation (higher by 19.2 per cent) and tax provision (up 18.5 per cent), the company's bottomline improved by 18.5 per cent over the previous year. With earnings per share rising from Rs 33.5 to Rs 35.5, the company decided to raise the dividend from 45 per cent last year to 55 per cent.

ITC pioneered cigarette manufacturing in the country and has maintained its leadership position in the industry since 1910. While cigarettes contribute 86 per cent of the company's turnover, ITC is also engaged in the businesses of unmanufactured tobacco, agri-products, paper and hotels.

Despite an increase in its bottomline, there was a drop in volume sales of cigarettes from 68.13 billion sticks in the previous year to 67.75 billion sticks. The drop in volumes is particularly due to the depressed demand for cigarettes at the price sensitive end, namely, the micro segment, as a result of high excise duty increases at 11 per cent and 10 per cent in the preceding two union budgets. Despite the general decline in exports of agri and aqua products from the country following tough global trading conditions in the wake of economic adversity in East Asia, Japan, Russia and parts of Latin America, ITC has managed to increase its exports by 20 per cent during the year under review.

Following its fallout with the Chitalias of the US, ITC has made a provision of Rs 60 crore to a contingency reserve towards a possible outcome of the negotiations with the Judicial Managers of ITC Global Holdings, purely as a measure of goodwill towards the international banking and investor community and in the interests of its own future business prospects.

Meanwhile in the first quarter of the current year, ITC has recorded a 14 per cent increase in its net profit at Rs 193.6 crore over the corresponding period last year. However, gross income dropped marginally by 1.3 per cent over the same period. The rise in excise duty over the last few years and the recent ban on sale

of tobacco products on railway platforms has further eroded sales. The difficult conditions in the international arena have finally taken their toll of the company's foreign exchange earnings. While export of leaf tobacco dropped by 50 per cent, agri exports declined by 10 per cent. The high rates of taxes on premium cigarettes has led to a flourishing trade in smuggled cigarettes. Reportedly, this leads to an unaccounted outflow of foreign exchange upward of Rs 500 crore. To tackle this problem, ITC claims that it is ready to contribute (on an experimental basis) to the cost of strengthening enforcement measures. If the seized contraband cigarettes are destroyed, this could create disincentives for the illegal retail trade.

The company's stock presently quotes at around Rs 1,016 on the bourses, discounting its 1998-99 earnings by a comfortable 40 times. ITC's strategy of improving its cigarette product-mix and moving up the value chain has paid off. Profits are expected to continue their upward trend despite a drop in volume sales in the current year as well.

DEEPAK FERTILISERS

Uncertain Policies

Deepak Fertilisers and Petrochemicals is engaged in the manufacture of coated ammonium nitrate prills (ANP), ammonium nitrate (AN), methanol, DNA, CNA and ammonia. While ANP brings in 34 per cent of the company's total turnover, di-ammonium phosphate (DAP) which is a trade commodity for the company brings in another 28 per cent. The company maintains a market leadership position in ANP which is its premium product. Methanol brings in another 15 per cent of total revenue, while AN accounts for 10 per cent of turnover.

During the year under review, the company crossed several milestones in terms of capacity utilisation. While capacity utilisation for AN and LDAN touched 167 per cent (1997-98: 161 per cent), that for ammonia touched 113 per cent (1997-98: 108 per cent). Consequently, the company's ammonia and methanol plants recorded the highest ever production in the year under review. This despite the restricted supply of natural gas. Apparently, the use of naphtha as an alternative fuel has helped to maximise production of both ammonia and methanol.

However, 1998-99 proved to be a damper

as far as operating margins were concerned. On the financial front, the company saw a mixed performance with net sales rising by 25.9 per cent even as operating profit declined by 0.8 per cent over the previous year. A lower increase in interest and depreciation provision helped the company post a 6.3 per cent rise in its bottomline.

Uncertain government policies and delayed decisions on the ad hoc concession for phosphatic fertilisers are taking their toll of phosphatic fertiliser manufacturing companies. Deepak Fertilisers was no exception. In fact, the quantum of ad hoc concession was not made known till December 1998 and government policy changed four times during 12 months, creating uncertainty in the area of production, planning and sales. The only silverlining in the whole scenario seemed to be the partial granting of recognition of subsidy for nitrogen content in complex fertilisers, for which the company had been making representations for the last seven years.

The mismatch in demand and supply of methanol on the global scene led to depressed market conditions, mostly on account of the south-east Asian crisis. This resulted in a fall in global prices, leading to a direct impact on price realisation for the company's methanol. Consequently, though sale of methanol in volume terms increased from 88,805 tonnes to 1,08,003 tonnes, sale in volume terms declined drastically by 10.4 per cent to Rs 78.6 crore.

The recession in the chemical industry also affected domestic demand for nitric acid. However, the company continued to be a major supplier in this segment.

The vulnerable position of the industry vis-a-vis government policies has also dampened investor interest in industry scrips on the bourses. Consequently, Deepak Fertilisers' stock, which quotes at around Rs 32, has a discounting of a mere 4.4 times on the Bombay Stock Exchange.

CENTURY TEXTILES

Turnaround Strategy

B K Birla group flagship Century Textiles has witnessed falling margins and huge losses in the last couple of years. While the company posted a net loss of Rs 85.2 crore in 1997-98, the following year saw the loss increase to Rs 93 crore. The ongoing recession and a 68-day strike by

some workers at the pulp and paper divisions has taken a toll of the company's performance. Cotton prices increased by 16 per cent and affected the textile unit's operations adversely. Production of rayon yarn declined from 14,387 tonnes to 13,985 tonnes in the year under review.

The adverse financial circumstances and the pressing need for cost reduction and further improvements in operational efficiency has forced the company to appoint Andersen Consulting to script a turnaround strategy for some of its divisions. Andersen Consulting, which is expected to submit its findings soon, has been appointed for undertaking strategic performance improvement projects for the textiles and rayon and the Manikgarh cement divisions of the company. Production of cement too declined by 17.6 per cent from 41.1 lakh tonnes in the previous year to 33.8 lakh tonnes.

As part of a restructuring plan, Century Textiles is likely to phase out its shipping division according to reports. Apparently, the company plans to sell off its ships in phases over the next three to four years. It has already sold off two bulk carriers in the year under review and currently has a fleet of six ships aggregating a dead-weight 2,01,117 tonnes, consisting of four bulk carriers and two oil tankers. The reasoning behind this decision is that this is not a core area for the company since the shipping division contributes merely 4 per cent of the total turnover. While cement accounts for 40 per cent of the company's sales, textiles bring in 26 per cent and rayon and paper/pulp 19 per cent and 11 per cent, respectively. Although a senior Century Shipping executive denied that the shipping division was to be closed down, it would make sense for the company to get out of the business now when its ships are only 12 years old; they have a life span of 20 years and the second hand market for ships has been on an uprend. Moreover, the shipping industry is currently in the grip of a global recession and is witnessing a fall in freight rates. This downturn is expected to continue for the next five years.

The company's stock presently quotes at around Rs 89 on the bourses.

ITC

Up the Value Chain

CIGARETTE major ITC fared well in 1998-99, notching up a 24.5 per cent increase in its operating profit on 11.9 per cent higher net sales. Despite sharp increases in interest charges (up 43.1 per cent), depreciation (higher by 19.2 per cent) and tax provision (up 18.5 per cent), the company's bottomline improved by 18.5 per cent over the previous year. With earnings per share rising from Rs 33.5 to Rs 35.5, the company decided to raise the dividend from 45 per cent last year to 55 per cent.

ITC pioneered cigarette manufacturing in the country and has maintained its leadership position in the industry since 1910. While cigarettes contribute 86 per cent of the company's turnover, ITC is also engaged in the businesses of unmanufactured tobacco, agri-products, paper and hotels.

Despite an increase in its bottomline, there was a drop in volume sales of cigarettes from 68.13 billion sticks in the previous year to 67.75 billion sticks. The drop in volumes is particularly due to the depressed demand for cigarettes at the price sensitive end, namely, the micro segment, as a result of high excise duty increases at 11 per cent and 10 per cent in the preceding two union budgets. Despite the general decline in exports of agri and aqua products from the country following tough global trading conditions in the wake of economic adversity in East Asia, Japan, Russia and parts of Latin America, ITC has managed to increase its exports by 20 per cent during the year under review.

Following its fallout with the Chitalias of the US, ITC has made a provision of Rs 60 crore to a contingency reserve towards a possible outcome of the negotiations with the Judicial Managers of ITC Global Holdings, purely as a measure of goodwill towards the international banking and investor community and in the interests of its own future business prospects.

Meanwhile in the first quarter of the current year, ITC has recorded a 14 per cent increase in its net profit at Rs 193.6 crore over the corresponding period last year. However, gross income dropped marginally by 1.3 per cent over the same period. The rise in excise duty over the last few years and the recent ban on sale

of tobacco products on railway platforms has further eroded sales. The difficult conditions in the international arena have finally taken their toll of the company's foreign exchange earnings. While export of leaf tobacco dropped by 50 per cent, agri exports declined by 10 per cent. The high rates of taxes on premium cigarettes has led to a flourishing trade in smuggled cigarettes. Reportedly, this leads to an unaccounted outflow of foreign exchange upward of Rs 500 crore. To tackle this problem, ITC claims that it is ready to contribute (on an experimental basis) to the cost of strengthening enforcement measures. If the seized contraband cigarettes are destroyed, this could create disincentives for the illegal retail trade.

The company's stock presently quotes at around Rs 1,016 on the bourses, discounting its 1998-99 earnings by a comfortable 40 times. ITC's strategy of improving its cigarette product-mix and moving up the value chain has paid off. Profits are expected to continue their upward trend despite a drop in volume sales in the current year as well.

DEEPAK FERTILISERS

Uncertain Policies

Deepak Fertilisers and Petrochemicals is engaged in the manufacture of coated ammonium nitrate prills (ANP), ammonium nitrate (AN), methanol, DAP, CNA and ammonia. While ANP brings in 34 per cent of the company's total turnover, di-ammonium phosphate (DAP) which is a trade commodity for the company brings in another 28 per cent. The company maintains a market leadership position in ANP which is its premium product. Methanol brings in another 15 per cent of total revenue, while AN accounts for 10 per cent of turnover.

During the year under review, the company crossed several milestones in terms of capacity utilisation. While capacity utilisation for AN and LDAN touched 167 per cent (1997-98: 161 per cent), that for ammonia touched 113 per cent (1997-98: 108 per cent). Consequently, the company's ammonia and methanol plants recorded the highest ever production in the year under review. This despite the restricted supply of natural gas. Apparently, the use of naphtha as an alternative fuel has helped to maximise production of both ammonia and methanol.

However, 1998-99 proved to be a damper

as far as operating margins were concerned. On the financial front, the company saw a mixed performance with net sales rising by 25.9 per cent even as operating profit declined by 0.8 per cent over the previous year. A lower increase in interest and depreciation provision helped the company post a 6.3 per cent rise in its bottomline.

Uncertain government policies and delayed decisions on the ad hoc concession for phosphatic fertilisers are taking their toll of phosphatic fertiliser manufacturing companies. Decpak Fertilisers was no exception. In fact, the quantum of ad hoc concession was not made known till December 1998 and government policy changed four times during 12 months, creating uncertainty in the area of production, planning and sales. The only silverlining in the whole scenario seemed to be the partial granting of recognition of subsidy for nitrogen content in complex fertilisers, for which the company had been making representations for the last seven years.

The mismatch in demand and supply of methanol on the global scene led to depressed market conditions, mostly on account of the south-east Asian crisis. This resulted in a fall in global prices, leading to a direct impact on price realisation for the company's methanol. Consequently, though sale of methanol in volume terms increased from 88,805 tonnes to 1,08,003 tonnes, sale in volume terms declined drastically by 10.4 per cent to Rs 78.6 crore.

The recession in the chemical industry also affected domestic demand for nitric acid. However, the company continued to be a major supplier in this segment.

The vulnerable position of the industry vis-a-vis government policies has also dampened investor interest in industry scrips on the bourses. Consequently, Deepak Fertilisers' stock, which quotes at around Rs 32, has a discounting of a mere 4.4 times on the Bombay Stock Exchange.

CENTURY TEXTILES

Turnaround Strategy

B K Birla group flagship Century Textiles has witnessed falling margins and huge losses in the last couple of years. While the company posted a net loss of Rs 85.2 crore in 1997-98, the following year saw the loss increase to Rs 93 crore. The ongoing recession and a 68-day strike by

Calcutta Diary

Between the Congress and the BJP there is really not much of a variation in the theme. Scarcely anything distinguishes, in terms of class lineage, leaders of the one lot from those of the other. The convergence of interests between the two parties is an unending affair. They share identical views on economic policy. It is all very gentlemanly. It is only those anxious to stress a sharp ideological cleavage between the two principal political parties who are having a trying time.

THE non-sectarian regime of the Congress Party was a benign watcher when the Babri Masjid was brought down. This allegation, some will say, is by now a cliché. That does not however detract from its relevance. Between the Congress and the Bharatiya Janata Party there is really not much of a variation in the theme, at least going by the *dramatis personae* of the two parties. The leaders of both parties by and large come from the same social stratum and often even belong to the same household. Mahatma Gandhi's own granddaughter chooses to opt for the BJP, the party symbiotically linked to the outfit that spawned the likes of Nathuram Godse. Madhav Rao Seindia was, once upon a time, in the BJP, he is currently a key functionary of the 10 Janpath Party. His ailing mother however continues to be the RSS-lining party's Queen Bee; and, irrespective of the whereabouts of the son, her two daughters, one of whom is already a union minister, are aiming for the Lok Sabha on the party's ticket. Or what about Rangarajan Kumaramangalam, offspring of one of Indira Gandhi's closest confidants, who himself was a Congress minister till the other day and has since taken a walk? Govind Ballabh Pant's son and daughter-in-law too have taken the same route. Arun Nehru happens to be amongst the very few who still bear the famous family surname. He too is no longer satisfied with his role as a non-official adviser of the Hindu revivalists; he has decided to join them formally. Switches have taken place, and are taking place, in the other direction as well. The gentleman, who won the Rae Bareilly seat on behalf of the BJP on the two previous occasions, is now determined to find salvation in the Congress ranks. Examples of this kind of reverse movement can be easily multiplied. The conclusion is glaringly obvious. Never mind the different labels they attach to themselves at a particular moment, these politicians playing the switching and re-

switching game belong to the same narrow class or coterie. Merely because they change their political label, their attitude to life and living does not alter. And the less said of ideology, the better. Stray images flashed across the newspapers and the Doordarshan screen assail the memory, images of Indira Gandhi, incumbent prime minister, hopping from temple to temple and seeking blessings from the most bigoted, sectarian-minded Hindu religious leaders. That she also simultaneously, frequented *dargahs* and synagogues only compounds the confusion. Secularism should not mean treating all religious denominations alike, but keeping distance from each and all.

The rignarole of the claim that of the two major parties, one dons the rabidly sectarian apparel while the other one does not, fails to cut much ice. Consider the overall composition of the two parties; scarcely anything distinguishes, in terms of class lineage, leaders of the one lot from those of the other. It is only outsiders who propose to either support or oppose these parties on ideological grounds who face difficulties. The possibility cannot therefore be ruled out that once the polls are over, the secular-sectarian divide would come to a dead-end, and furious negotiations would be on to give shape to terms and conditions for supporting a stable regime in which both groups will have equitable representation. The theory of footlooseness can in fact be generalised. Nothing is any longer odd under the perennially grey Indian sky. A formidable secretary-general of a so-called socialist party is the least bothered about his ideological pretensions: he has a private identity, which he greatly cherishes, as a loyal servitor of one of the country's leading industrial tycoons. And the leading lights of the parties claiming to represent the backward classes share a common concern to take care of their personal interests first.

The festival of hurling allegations of corruption against one another is tapering off for the same objective reason. The lady at 10 Janpath is certainly not unduly worried over the BJP threat to import from Switzerland the final bunch of papers relating to the Bofors bribes. The threat is altogether vacuous. For by now it is well known that, as per the verdict of the highest Swiss court, the bribe money, of which a portion has reportedly gone into the coffers of the gentleman of Verona – or is it Torino? – has been co-shared with the four famous NRI brethren settled in London. These brothers are, again as everybody knows, as close to the present prime minister as the travelling salesman from Torino is to 10 Janpath.

In fact, the convergence of interests between the two major parties is an unending affair. An official committee has gone to great lengths to unravel the mystery of the huge capital erosion suffered a few years ago by the Unit Trust of India. Its report has thrown quite a few hints regarding the authorship of the shenanigans. But, given the present concatenation of the country's superstructural politics, investigations of this nature are unlikely to go very far. Information was solicited on the floor of parliament on the identity of the parties which had benefited from huge private placements by institutions such as the UTI and the ICICI between such and such years. These placements were one principal reason for the UTI's coming to grief in that phase. The response to the parliamentary questions was uniformly fuzzy, the authorities falling back on the plea of the supposed inviolability of the statutory provision for protecting the secrecy of the relationship between banking institutions and their clients. The free market cannot be prevented from indulging in gossip though. At least three-fifths, if not more, of those private placements, stock market cognoscenti are prepared to swear, had gone to a particular family business concern entrenched in Mumbai and Gujarat. The two leading political parties in the country have a common stake in protecting this business house; both parties – and some others too – are flush with funds contributed by it.

Both major parties share identical views on economic policy issues, because their leaders come from the same social background. The return of colonialism, the thinning out of government investment and privatisation of existing public sector units at a furious pace define the emerging milieu. The plot, as they say, will thicken. The trickiest problems India, along with other developing economies, will face in

the next decades will involve issues of trade and trade-related foreign investment. The two principal parties in the country are committed by word and deed to go along, jointly as well as severally, with the diktat of the WTO in these matters. After all, it was the commerce minister of a Congress government who signed the Marrakesh Treaty in 1994. The BJP, because it was then in the opposition, made quite a show of declaring itself against the provisions of the Treaty. But all is well that ends well. After it entered the government in 1998, a dramatic transformation took place in the BJP's stance. The amendment to the Indian Patents Act in order to make it conform to the Articles of Agreement of the WTO was a one hundred per cent joint operation on the part of the two national parties. It was a Congress MP, with a formidable legal reputation, who explained the amendments. The BJP minister for industrial development, who had formally moved the amendments, stood up to confess that he had nothing to add to the explanations provided by the Congress luminary.

Meanwhile, though, the ministry of finance has gone off in its own manner. It did not worry the least whether the amending statute had been given the imprimatur of approval by parliament. Over the decades, it has been shifting its loyalty to the international financial and trading institutions which articulate the views of the superpower. According to an article enshrined in the WTO manual, developing countries have the prerogative to maintain for an indefinite period, for balance of payments reasons, quantitative restrictions on agricultural imports. It is only when the IMF is satisfied that the country's balance of payments position has improved significantly and it so informs the WTO, that the WTO is expected to issue a directive to the country concerned to withdraw the restrictions. By convention, the IMF, before transmitting its view to the WTO, seeks the opinion of the ministry of finance of the country concerned. India's ministry of finance is more loyal than the royals themselves; it had, on its own, informed the Fund sometime ago that the country's balance of payments position was excellent so that the WTO could be advised to direct the government of India to let go of the quantitative restrictions on farm inputs. Not a squeak of protest has been heard in the matter from the major political parties, including those who constitute the formidable farmers' lobby.

Colonialism is *passe*, so is fundamentalism. Talk of the last-ditch battle between sectarianism and secularism being

fought on Indian soil would seem to be greatly overdrawn. It is all very gentlemanly. Where the situation so warrants, the sectarians will quote approvingly the sweet reasonableness of an Atal Behari Vajpayee muffling the war drums of the VHP-RSS rabble. Similarly, in due season, the Congress Party will not flinch from exhibiting film clips of a devoutly demure Indira Gandhi and her bare-bodied elder son, both lying prostrate and receiving benediction from semi-clad Hindu *sadhus*.

It is only those specially belonging to the Left, anxious to stress a sharp ideological cleavage in the behaviour pattern of the two principal political parties, who are having a trying time. Since the facts do not match, they have begun to cross over to democratic decentralism. The Central Committee resolution on electoral strategy is being interpreted differently by different state units to suit their local compulsions. Apart from the Sharad Pawar coup which took them unawares, what additionally worries sections of the Left is the prospect of a substantial segment

of MPs elected on the Congress ticket breaking away from the party to join even the BJP and share the loaves and fishes of office. Some of these post-modern converts to the communal-sectarian cause are unlikely to experience any qualms of conscience. Where opportunity fails, opportunism could beckon, and why be excessively moralistic about it? True, some of the elements the BJP has gathered under its umbrella are pretty poor examples of the human species; they might well turn out to be the greatest menace to national integrity. It is nonetheless the other sensation that brims over: haven't we given a bloody nose to the Pakistanis? Those denigrating the scale of our victory at Kargil are *prima facie* agents of the Inter-Services Intelligence, lock them up, and rough them up too. There appears to be little awareness that the joint secular-sectarian enthusiasm to discover ISI agents in every hush could provoke a major confrontation with Bangladesh. Hopefully the superpower will then, once more, bail us out.

The colonial order is back with a bang.

Need for Promotion of a Bills Market

The Reserve Bank has taken a series of measures to deepen the money and government securities markets and to facilitate equilibrating demand for and supply of short-term funds at fine rates of interest. Parallel efforts are called for to promote the market for bank-accepted bills as a major money market instrument to promote financing of asset-creating activities by banks.

I One-Sided Effort

IN its avowed objective of applying indirect instruments of monetary control as distinguished from direct instruments, the Reserve Bank of India (RBI) has taken a series of steps to promote and develop further the money and government securities markets. During the last five to six years, the substance of credit and monetary policy pronouncements has been overwhelmingly related to these steps: freeing of money market rates of interest; introduction of varied treasury bill instruments with market-determined yield rates and auction system in floatation of government paper; promotion of the primary dealers and satellite dealers system for retail marketing of government securities; permission granted to FIs to invest in government securities; setting up of gilt funds; and introduction of RBI repo along with the gradual expansion of the eligible participants and instruments in inter-bank repo (treasury bills, government securities, PSU bonds and private corporate debt securities held in dematerialised form in a depository and undertaken by banks and some non-bank entities). After the last April policy announcement which gave added focus on the reforms in the money and government

securities markets, many significant steps have been added in this respect: auction of government securities on price basis instead of yield basis facilitating consolidation of already outstanding loans; announcement of a definitive calendar of treasury bill issues to provide for greater certainty in the timing and size of primary issues; and above all, permission granted to banks, PDs, and FIs to undertake forward rate agreements and interest rate swaps as products of their own as well as for market-making purposes so as to facilitate hedging of interest rate risks and ensuring orderly development of the derivatives market.

And now in August two major further steps have been taken by the RBI, also in pursuance of the last credit policy. First, specified non-bank entities, which were earlier permitted to only lend money in the call money through reverse repos to banks and PDs, have now been permitted also to borrow through repos on par with banks and PDs. The new list contains 52 non-bank entities (primary dealers, dedicated gilt funds, mutual funds, insurance companies and some FIs) and 117 notified central government securities apart from all treasury bills. Secondly, a sub-group of the standing Technical Advisory Committee on Money and Government Securities Markets of the RBI,

constituted specifically to prepare a technical paper covering all aspects of repos, has submitted its report with far-reaching recommendations.

Some of the recommendations of the above sub-group included replacement of Public Debt Act, 1944, by the proposed Government Securities Act, withdrawal of the government notification of 1965 which had prohibited repos, introduction of over-the-counter and tripartite repos (with a Clearing Corporation as a triparty agent), allowing day-light overdraft facility for the current account holders of the RBI permitting rollover of repos, and certain other recommendations relating to evolving good market practices. As stated above, the Reserve Bank has already announced the eligibility of 52 non-bank entities and over 150 dated securities for the repo market. It has also clarified that there is no restriction on the duration of repos. It is actively considering the creation of a well-capitalised Clearing Corporation to act as the third party in a repo deal. The Clearing Corporation would help reduce the counter-party risks in repo deals. The most important recommendation of the sub-group, however, is to empower the RBI with adequate regulatory powers under Section 29A of the Securities Contract Regulation Act. While the RBI seems to be attempting to get over the fear of the securities scam of 1992, bringing about legal changes may take a long time. Besides, issues such as whether repo is a sell-buy operation or a lending-borrowing operation and stamp duty in the case of repos in PSU bonds need sorting out and these too may take quite a while. It is necessary that while these changes progress at a snail's pace, the RBI should strengthen its own infrastructure to facilitate an expanding secondary market of government securities and to be able

to effectively monitor this market to avoid a repeat of 1992 experience.

EFFORT TO PROMOTE BILLS CULTURE MISSING

With the implementation of the above measures, the money and government securities markets would no doubt receive significant impetus and attain depth; the process of equilibrating between demand and supply of short-term funds at fine rates of interest would be ensured. Such a process is also a necessary condition for transmitting monetary policy impulses, but it is not a sufficient condition for attaining the other and more crucial objective of ensuring appropriate flow of bank credit into the productive sectors of the economy.

In this respect, while traditional systems of bank credit regulation and delivery such as the credit monetary arrangement (CMA) and the fixation of maximum permissible bank finance (MPBF) had been rightly given up by April 1997, no attempt has

been made to introduce newer instruments in support of improved bank credit delivery consistent with the reform process. The danger in promoting traditional money market instruments to the exclusion of instruments having direct link with credit delivery is the concentration of banks' activities in excessive treasury and money market operations to the neglect of their commercial credit business. The unduly low levels of incremental credit-deposit ratios of banks in recent years, ranging from 30 to 45 per cent, bear testimony to this aspect of the banks' behaviour.

Such a danger can be prevented only by encouraging conventional cash credit delivery and also the circulation of newer securitised credit instruments which have direct link with bank credit. Such instruments are well known. They take the form of securitisation of bank credit, promotion of bankers' acceptances and, above all, creation and nurturing of a genuine bills market. Availability of such instruments in the financial markets will have many beneficial effects, the most

important of which will be the promotion of improved flow of bank credit as well as its better distribution. In many developed and developing country markets, the instrument of bank-accepted bills has been not only a major financing medium but also a major money market instrument to promote asset-creating activities among banks and thus directly contribute to real economic activity. The subject of encouraging bill finance is not new to this country, but for want of a determined effort the idea fell by the wayside, particularly after the initiation of financial sector reforms.

It is true that along with repo facilities, the system of bills discounting and rediscounting facilities had come into disrepute in the financial scam of 1992 and hence fresh instructions were issued in July 1992 to banks to ensure various norms and discipline in providing bill finance including avoidance of financing large borrowers outside the consortium arrangement, discounting accommodation bills, and deploying portfolio management funds for discounting bills, and generally restricting bill finance to the working capital needs based on credit norms. A thorough study of these outdated instructions may throw up newer methods of promoting bill culture in the liberalised environment. An aggressive rediscount mechanism by the RBI, in addition to those by apex institutions like the IDBI, SIDBI and NABARD (who face funds constraints), could form an important component of the bills promotion effort.

It is clear that in the current liberalised environment wherein guidelines on societal goals in bank credit dispensation are executed more in the breach and wherein even the RBI machinery does not care to monitor their implementation vigorously as it does implementation of its regulations on the promotion of the money market, praiseworthy official instructions on better credit delivery serve no purpose; they have to be carried forward with concrete market instruments. The following is a good example in this respect. Recently, in the context of ensuring prompt settlement of dues to SSI units as also for

encouraging 'bills culture', banks were advised to ensure that, with effect from January 1, 1998, not less than 25 per cent of the total inland credit purchases of the borrowers were to be paid through bills drawn on them by concerned sellers. Banks were also advised to monitor the compliance with this requirement through a suitable information system and charge penal interest rate in cases of non-compliance. In July 1998, banks were further advised to ascertain periodically from their medium/large industrial borrowers, the extent of their dues to SSI suppliers and the action proposed to be taken by them to clear the overdues, if any. In case there were still overdues towards SSI suppliers, banks were advised not to hesitate to take it as a negative factor while fixing the rate of interest on the borrowings of such corporate bodies. All of these

seemed to remain on paper for want of attractive marketable instruments for banks to invest in. For instance, the size of inland bills purchased and discounted by the scheduled commercial banks have stayed put at Rs 14,428 crore at the end of March 1998 and Rs 14,295 crore at the end of August 1999; as a percentage of bank credit, these inland bills have receded from 4.4 per cent to 3.8 per cent during the period. Also, a substantial part of these bills pertain to food procurement credit and are not genuine commercial bills.

Thus, even as attempts are made to widen and deepen money market activities, it is necessary that the RBI bestows some attention on studying the importance of trade credit in the non-financial corporate world and on promoting various methods and instruments to encourage the use of bankers' acceptances and discounting/

rediscounting of genuine commercial bills by banks and financial institutions. It is said that in the context of the initiative taken by some of the big-size corporates to securitise their receivables, the IDBI has planned to enter the securitisation market in a big way with a corpus of Rs 2,000 crore. There are also mortgage-based securities issued by such institutions as the National Housing Bank. There is the known impetus to securitise receivables of State Electricity Boards and such other cash-starved organisations. The RBI itself was to formulate guidelines on the securitisation question. While such efforts may take care of the bulk needs of specific projects, the needs of myriad borrowers, particularly those of medium- and small-scale enterprises, will remain untouched in a bureaucratic system that has imbibed nothing of 'societal' goals, but given the effort their needs also can be brought into the mainstream market through collective instruments like bank-accepted bills.

II

Call and Forex Markets

The overnight money market witnessed considerable firmness during the month. With the abundance of liquidity including the cushion available through the refinancing route, the market players, especially the primary dealers and foreign banks, had got used to arbitraging between the call money and government securities markets. As a result, government securities had been witnessing an unprecedented rally throughout July and early August.

GRAPH E: YIELD CURVES FOR 364-DAY TREASURY BILLS AND DATED SECURITIES: DAY OF MAXIMUM TRANSACTIONS (AUGUST 25) DURING THE SECOND HALF OF AUGUST 1999

Simultaneously, as the busy season was approaching, the RBI became again aggressive not only on the primary issues of government securities but also on its open market operations window. The RBI was also forced to intervene in the foreign exchange market to curb the rupee rate becoming volatile. All of these combined to produce a net outflow of funds from the market (Table 1) and the market was caught by surprise.

As a result, call rates flared up and went up to as much as 35 per cent in the second fortnight of August (Graph A). Many banks expecting a cut in the interest rates and CRR had taken a position in government securities even at the cost of leaving their CRR compliance uncovered in the first week of the reporting fortnight (ending August 13). When some large banks refrained from lending in the call at the beginning of the reporting fortnight, panic

set in and banks showed willingness to borrow even at 35 per cent (Table 3). At this rate, however, the amounts borrowed were not very large as indicated by the weighted average rate of around 17 per cent at a time even when call rates were quoted at 35 per cent; the volatility in the rates was also sharp as reflected in the coefficient of variation (Table 2). The RBI's assurance of providing additional liquidity, some inflow of funds in the third week and caution on the part of banks in promptly providing for CRR obligations, brought down the call rate to a range of about 9.60-12.50 per cent and 7.50-8.90 per cent in the last two weeks of August, respectively.

On the external front, the rupee showed signs of weakening. On dollar demand from corporates, oil companies and repayment of government debt, the rupee, which started at a stable level of Rs 43.32 to a dollar, steadily slipped to Rs 43.55 to a dollar (RBI middle rate) (Graph B). The RBI at this juncture reminded the

market by issuing a statement on August 23 that arrangements were made by the Reserve Bank of India to meet fully or partially the foreign exchange requirements for import of crude oil by the Indian Oil Corporation, that Reserve Bank would similarly meet the government debt service payments directly as necessary, and that in case there is a temporary demand-supply gap, the Reserve Bank would be prepared to intervene directly or sell dollars through SBI in order to augment supply in the market, as considered necessary. The market movements, however, were not on account of speculation but on genuine demand and as such cooled down on the RBI bridging the temporary gap between demand and supply. The rupee in fact firmed up and returned to stability at 43.32 on August 30.

The firmness of the overnight call rates, however, was not reflected in forward premium rates as the firmness was due to temporary shortages and the annualised premia continued to be stable (Graph C).

Figures in parentheses in cols 3 to 6 represent numbers and amounts of non-competitive bids which are not included in the total. Figures in the square brackets under cols 8 and 9 represent weighted average price and respective yield.

* Bracketed figures in col 7, if any, relate to devolvement on primary dealers, exclusive of RBI - nil

III Primary Market

Dated Securities

The first auction of dated securities during August was held on August 5 when the government announced the price auction of the reissued stock of 11.99 per cent 2009 paper for a notified amount of Rs 3,000 crore. The auction met with an overwhelming response. The RBI received 236 bids for an amount of Rs 7,253.05 crore, and accepted 79 bids for the notified amount. The cut-off price was Rs 102.90 with an implied yield of 11.48 per cent. The cut-off yield was somewhat higher than the market expectations, for the average of bids had worked out to Rs 102.99, that is, higher than the cut-off price.

The above security was re-issued on August 27 again in a price-based auction. This time the cut-off price was Rs 102.25 (implied yield 11.59 per cent). Of the 121 bids received for Rs 3,119 crore, the RBI accepted 105 bids for the notified amount of Rs 2,500 crore.

Thus, by the end of August the government had raised Rs 59,630 crore out of the gross market borrowings of Rs 84,104 crore; private placements and devolvments on the RBI had amounted to Rs 24,547 crore, while the RBI had sold Rs 23,556 crore through its open market operations.

Between the above two issues, two states, namely, Andhra Pradesh (Rs 400 crore) and Tamil Nadu (Rs 200 crore), entered the market to raise an aggregate sum of Rs 600 crore on August 19. Since last year, state governments have been permitted to raise through the auction route between 5-35 per cent of their allotted market borrowings. In January, Punjab government had raised Rs 60 crore through this route. The latest auctions received good response. In the case of AP, as against the notified amount of Rs 400 crore, 97 bids for an aggregate amount of Rs 1,126.05 crore were received. Forty-two bids up to the yield of 11.77 per cent per annum for an aggregate face value of Rs 400 crore were accepted, of which 34 bids received full allotment and 8 bids received partial allotment. For TN, as against the notified amount of Rs 200 crore, 73 bids for an aggregate amount of Rs 779.05 crore were received. Twenty bids up to the yield of 11.74 per cent per annum for an aggregate face value of Rs 200 crore were accepted, of which 14 bids received full allotment and 6 bids received partial allotment. The next tranche of the state loans for Rs 3,250 crore at coupon yield of 11.85 per cent was announced on August 31; the sale of

10-year loan was to be conducted on September 8. In April this year, the RBI had raised Rs 6,990 crore on behalf of the states through a similar 10-year loan at a coupon rate of 12.15 per cent.

Treasury Bills

The interest in treasury bills continued to be subdued. The number of bids received in the auctions indicated that the interest was largely restricted to primary dealers who were compelled to put in their bids in fulfilment of their bidding commitments. The yield on 14-day TBs was kept constant at 8.61 per cent in the initial two weeks of the month although the RBI had to take devolvment of Rs 75 crore in the second auction. In the last auction of the month it was reduced to 8.09 per cent as the response was more than double the notified amount of Rs 100 crore (Table 4). The 91-day bill auction too devolved on the RBI for Rs 95 crore in the second week. The RBI reduced the yield on this paper from 9.08 per cent to 9.00 per cent (Table 5). The yield, however, jumped significantly to 9.46 per cent in the auctions held in the third and fourth weeks of the month. Similarly, the yields on 182-day and 364-day bills were also increased from 9.31 per cent to 9.89 per cent and from 10.25 per cent to 10.28 per cent, respectively (Tables 6 and 7).

Bonds Market

There was a flurry of activities in the primary bonds market during August in an attempt to raise money before the busy season for bank advances sets in October-November. Banks are the largest investors in the private placement of the bonds market. There has been a general decline in yield rates in all types of issues.

The month of August also saw the dominance of state-level government undertakings (nine issues for Rs 1,730 crore) followed by the Central PSUs (4 issues of Rs 1,370 crore). There were the IDBI and ICICI (Rs 475 crore), three banks, including a foreign bank (Rs 870 crore), National Housing Bank (Rs 150 crore), and five private corporates (Rs 700 crore).

Other Instruments

Activity in commercial paper (CP) market increased considerably in the recent period as corporates have begun to bargain for bank funds at lower rates of interest. According to the data released by the RBI, there was a sudden jump in the quantum of CPs issued from Rs 754 crore in the fortnight ended July 15 to Rs 2,384 crore, Rs 1,507 crore and Rs 1,535 crore as of July 31, August 15 and August 31, respectively. The rates of interest also were lower by 25 basis points from 9.30 per cent to

(-) means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in per cent per annum. Securities with small-size transactions (Rs 10 crore or less) and inflation linked bonds have been dropped from the above list but included in the respective totals.

Notes: (1) Yields are weighted yields, weighted by the amounts of each transaction.

(2) Current yield has not been worked out for treasury bills.

9.10 per cent at the minimum but were somewhat higher at 12.50 against 12.00 per cent at the maximum. In addition, several corporates including Deepak Fertiliser and Petrochemicals Corporation and Bilt were rated by rating agencies for their CP programmes.

Conversely, activity in CDs was lower on account of the absence of competition for bank deposits. As per the data avail-

able as of July 30, the new CDs have ranged from Rs 30 to Rs 40 crore per fortnight; the outstanding amount of CDs at Rs 3,463 crore as against Rs 7,287 crore a year ago.

IV Secondary Market

Dated Securities

Prices of government securities were volatile during the month. Initially, the prices increased sharply as the primary dealers and foreign banks took positions in long-dated securities on expectations of CRR and interest rate reductions. In fact, one-year yield fell to below 10 per cent while 10-year yields dipped to around 11.45 per cent. The prices of bonds appreciated by as much as 70 paise at the short end and Rs 2.50 at the long end. The market interest continued to remain in medium- and long-dated securities. Once it was clear to them that the RBI may not reduce the rates in the near future, the market players began to look for liquidity to cover their statutory obligations. By this time the liquidity in the market had dried up and the market had little choice but to raise funds through sale of securities. This resulted in a sharp fall in security prices (Appendix Table). There was also a sharp drop in the turnover in the government securities market from Rs 32,692 crore in the week ended August

6 to a range of Rs 18,002 crore to Rs 9,133 crore in the subsequent four weeks ending September 3. The behaviour of yield curve during August shows some narrowing of the yields between short-dated and long-dated securities (Graphs D and E) as between the first and the second half of the month. For some period now such a narrowing has been occurring as a result of, amongst other things, the increased shift by the RBI in favour of long-dated security issues and thus their larger supply in a situation of excess liquidity in the system.

Repos and OMOs

The overwhelmingly good response to the 11.99 per cent 2009 security auction, prompted the RBI to be aggressive on its open market operations window almost immediately after the auction. Accordingly, it placed 11.98 per cent 2004 and 12.40 per cent 2013 securities on its OMO window. As explained below, a substantially high yield offered on the latter security helped the RBI to mop up as much as Rs 2,323 crore, while the former gave only Rs 155 crore. In fact, the OMO window at this time also acted as a market signal attempting at cooling the securities market that had witnessed prices spiral as banks and primary dealers took position on expectations of an interest rate cut. The RBI sold Rs 5,772 crore worth of securities in the four weeks of August.

The RBI was also seen to be using the OMO window for price signals. For instance, after the auction of 11.99 per cent 2009 security, when the market witnessed an overwhelming response, the RBI immediately placed 12.40 per cent 2013 security at a price that was 25 paise below the market price. The market reacted to this and the security prices fell immediately.

The fixed rate repos continued to act as effective floor for the overnight rates. Barring Rs 45 crore received in the first week of August, the fixed rate repos hardly generated any market response (Table 8). Inter-bank repos have also been meagre during August (Table 9).

Bonds and Other Instruments

As a result of the liquidity shortage, there has been a sharp reduction in the turnover in the NSE's commercial debt market, particularly during the last three weeks of August (Table 10). However, interestingly, as a result of increased primary issues of CPs, their transactions in the secondary market picked up somewhat towards the end of the month.

TABLE 9. REPO TRANSACTIONS IN GOVERNMENT PAPER (OTHER THAN WITH THE RBI), AUGUST 1999

KASHMIR

The Negative Vote

For the bulk of the population of the Valley electoral participation in the current context of a political impasse only symbolises support for the legitimating structures which have been called into question and form the basis of the militant movement. The verdict, not surprisingly, is given through non-participation.

WHILE elections cannot be seen as a sufficient basis to gauge the substance of democracy anywhere in India, least of all Kashmir, a high participatory content in the electoral process does lend some semblance of legitimacy and significance to elections as an institution of democracy. In the ongoing parliamentary elections, even this basic requirement has not been fulfilled in the Valley. According to official statistics the voter turnout for the first phase of Lok Sabha polls in the Srinagar constituency, comprising two central Kashmir districts, was a mere 11.96 per cent. This is perhaps the lowest ever voter turnout anywhere in the history of Indian elections.

More than the incidence of voting it is the distribution of voter turnout across segments of the constituency that is more revealing. Almost 25 per cent of the total turnout has come from one segment, Char-e-sharif, the place where the shrine of the sufi saint Noor-ud-din Rishi was gutted, which is under complete army control. In Charar, the turnout was 55 per cent. If this is ignored on the grounds of being a clear case of voting under coercion then the overall percentage of voter turnout drops to just 8 per cent. The segmentwise distribution of turnout within the constituency is: Hazratbal 5.5 per cent, Zadibal 3 per cent, Idgah 2 per cent and Habakadal, a pathetic 0.5 per cent! This is as good a complete boycott of the polls by the people as there can be. By all accounts the mass boycott was voluntary. Doubtless, the boycott appeal by the All-Party Hurriyat Conference, an umbrella organisation of secessionists of various hues, had its effect.

The low level of voter participation is neither sudden nor surprising. In the six parliamentary elections held in Jammu and Kashmir before 1989, the average turnout was 55 per cent. In Srinagar, voter turnout was about 65 per cent. In 1996, it was 41 per cent which declined to 31 per cent in 1998.

The current levels of voter participation seem to suggest that the voter in Kashmir has now rejected the system. The rank-and-file of the National Conference, which is cadre-based, may have been bruised and battered but had not been wiped out. Now

it would appear that Farooq Abdullah's support to the BJP has disappointed the rank-and-file: Gandarbal which is his 'hereditary constituency' polled under 10 per cent. Clearly, Saif ud-din Soz was reflecting the worker sentiments when he revolted against the high command and voted against the BJP. Within the framework of mainstream understanding of the Kashmir issue wherein rigged elections are the root cause of the problem, it can be argued that these numbers do not mean much. While there are well-founded reasons to say so, the fact remains that numbers show a clear declining trend in the post-1991 period when the incentive to show high participation turnout would have increased for the government for very obvious reasons.

This is not to suggest that the incidence of participation has not been rigged in the past; in fact the electoral manipulation has been much worse. The distinguishing feature of elections in Kashmir has been the number of candidates 'elected unopposed'. It is not well known that the incidence of candidates elected unopposed is the highest in Kashmir. The numbers are startling: in 1951, 73 out of a total of 75 seats were won by National Conference uncontested; in the 1957 elections, 43 candidates out of 75 were elected unopposed; 70 candidates were returned unopposed in the 1962 elections. In 1967, nomination papers of 118 opposition candidates were rejected to have 39 out of 75 assembly constituencies returned candidates unopposed!

But it is neither the low participation which has attracted attention nor the 'no-contest' elections which is a major failing of this election in Kashmir. The basic failure of the electoral process in Kashmir so far is that they are incapable of extending the voting rights of Kashmiris to beyond the confines of institutionalised electoral arenas. The demand that has been made in the Valley is to extend the scope of this arena.

Within the systemic givens, the exercise of franchise has not and indeed cannot lead to an effective articulation against political, social and economic exploitation that the people of Kashmir have been subjected to. It is this reason that has consistently kept

people out of the electoral process; it is not so much rigging. True that is a factor but not the basic factor.

For the bulk of the population, electoral participation in the current situation of political impasse symbolises the intention to be loyal to the legitimating structure which has been called into question and forms the basis of the militant movement in Kashmir. Thus, the verdict is seen to be given through non-participation. The government and the Election Commission may like to think that their job is over with the administration of elections. But anybody who has witnessed the electoral process in Kashmir will be struck by the farcical nature of the entire exercise. The regional press has been virtually banned by the government from covering the electoral process with the home department ordering all local dailies not to publish statements which instruct the people not to vote. In the last parliamentary elections, the militants reacted to this directive with the result the papers suspended publication prior to the elections. In a majority of constituencies and segments within constituencies even a single election meeting has not been held nor has any party circulated an election manifesto stating its priorities. If all this was not enough, the award of the Delimitation Commission prior to the last parliamentary elections perpetuated the farce by reducing the relative representative strength of the Valley. In the face of such gross violations of ethical electoral practices, it is doubtful how any elections in Kashmir can be taken seriously. The entire process of conducting elections has wrecked havoc even with the practice of formal democracy, let alone the substance of a true democracy.

All that elections seek to do in Kashmir is legitimising pre-determined choices. They are in no way serving as a mean for effective articulation of political, social and economic exploitation of Kashmiris. The people of Kashmir may not support militancy with the same degree of enthusiasm as they did in the period 1989 to 1992. But that is in no way going to translate into a vote for India or a mandate for any party which is status quoist. That this premise which has formed the basis for all initiatives in Kashmir is misplaced has been now proved beyond dispute. The symbiotic relationship of the state, its repressive arms and the civil bureaucracy has imparted a strand of authoritarianism to the relationship between the India and Kashmir. It is this that needs to be broken before any meaningful elections can be conducted. Whatever else they might succeed in doing, elections in Kashmir have not and will not dignify democracy. That is for sure.

Lok Sabha Election: Playing the Semi-Finals

Indu Sinha

This election in Bihar is unique in more ways than one. The rapidly changing political equations have finally given way to the bipolar contests between the two main coalitions: the Congress, the CPI(M) and the Rashtriya Janata Dal as one pole and the BJP and the Janata Dal (United) as the other. With the People's War and the MCC boycotting the elections, the state is not likely to see a peaceful time in the weeks to come.

THE last Lok Sabha election of this century is going to rearrange the political mosaic in Bihar. Old political settings are likely to emerge with new power configurations. Bihar, at the threshold of the next century is not in a mood to retain the decade-old regime of 'factional social justice' because, the time has arrived for a trickling down of the 'social justice'. This is what the pre-poll review of the situation indicates.

This election is unique in more than one sense. The rapidly changing political equations have finally given way to bipolar electoral contest between the two main coalitions: the Congress, the CPI(M) and the MCC rallying round the ruling Rashtriya Janata Dal, as one pole and the BJP and the Janata Dal (United) as the other. While, one segment of the traditional left – the CPI(M) – has remained in the RJD-Congress coalition, the other and the bigger segment, the CPI has snapped away on seat-sharing issues. The revolutionary left, the CPI(ML) Liberation has opted to contest separately. In Jharkhand region, while efforts for a final unity between all splinter and small groups failed, the second stage unity between four small groups succeeded in the formation of the Jharkhand Front and some electoral understanding has been reached between the JMM(S) and the JMM(M), creating two small poles. While, upper-BCs-OBCs-dalit vote bank is divided between the poles, the Muslim vote is united (though local influence and factors cannot be ruled out) in favour of the RJD-Congress coalition.

The gender aspect of this election is as discouraging as ever, with few female candidates in the fray. While the RJD has only three women candidates, women are entirely absent in the JD(U) list of candidates. The Congress and the BJP have fielded two candidates each, while the CPI and the CPI(M) have no female

candidates. The Liberation has fielded two women candidates. Among the Jharkhand parties the wife of the JMM(S) supremo Shihu Soren is contesting from Dumka, the number of female contestants altogether being only 10.

The conduct of the elections in this state – ravaged by floods especially in 17 districts with ultras active with another 17 districts declared as 'extremist-affected' and crumbling with the frequent bloody clashes between the MCC and the People's War both of them boycotting the polls – is a herculean task for the administration. The discovery of duplicate ballot boxes in nine out of 55 districts across the state, however, has put raid to the possibility of fair elections. That, out of 3,80,000 ballot boxes delivered by the Election Commission, 1,387 (in seven districts) ballot boxes had duplicate numbers, was confirmed in the statement issued by the Election Commission on August 25. The officially confirmed local figure is above 1,500. The EC is making certain special arrangements to prevent more breaches of the poll process.¹

The budget sanctioned² for conducting election in 54 constituencies distributed over 84,000 polling booths is Rs 81 crore with an additional Rs 10 crore sanctioned for the critical law and order situation in the state. The state government has asked for 750 companies of paramilitary forces from the centre³ with over 70 per cent polling booths having been identified as 'sensitive' in many districts. For instance, in Hazaribagh alone 80 companies of paramilitary force have been demanded in view of extremist as well as communal threats in Vaishali (85) and in Patna (25) in view of a small segment of this constituency – Masaurhi storming with frequent bloody clashes between the MCC and the PW. Out of 160 polling booths in Masaurhi,

107 are sensitive. Article 144 has been imposed over Patna district on August 18 until the counting is over. Altogether 2,500 polling booths are identified as sensitive in Patna district alone, while the percentage of sensitive booths in some of the central and south Bihar districts, for instance, Bhojpur is 73, Gaya is 81, and Hazaribagh is 69.

THE EQUATIONS

How is this mainly bi-polar contest, with a triangular fight in some constituencies going to culminate? The RJD supremo Laloo Prasad Yadav has 'finalised' 14 seats adjusted in favour of the Congress.

The Congress is contesting nine seats, in the Jharkhand region, where it has to face the BJP contestants in most places; two seats in central Bihar and three in the north where it has to face the JD(U) contestants.

The CPI is contesting altogether nine seats Nalanda, Hazaribagh, Godda, Betiah, Madhubani, Balia, Khagaria, Buxer and Jamshedpur of which it has to contest the RJD on four and the Congress on two. This courage to snap away from the coalition, however, could not satisfy the party leader of the CPI in the assembly, who resigned showing grave 'dissatisfaction'. The CPI(M) is satisfied with two seats of Purnea and Bhagalpur, adjusted in its favour and Dhanbad, the traditional seat of the Marxist Co-ordination Committee (MCC) usually contested and won by A K Roy, is left 'reserved' for him. The RJD is now contesting 36 seats, out of which on two seats – Hazaribagh and Godda the RJD and the Congress are playing a 'friendly match'. The Congress is contesting altogether 16 seats. The ruling party (RJD) had to face another blow on August 23, when one of its ministers Devnath Prasad resigned from the ministry. Former MP, Ramswarup Ram and the former minister, Harinarain Singh, along with Devnath Prasad, joined JD(U). Some other RJD local leaders of Nalanda district also followed the suit. The local leadership of the Congress also revolted with Shyam Sunder Singh Dheeraj resigning from the party to join JD(U) after he was assured of getting ticket from his constituency, Begusarai.

The seat adjustment pattern within the BJP-JD(U) coalition indicates a different trend. Unlike the RJD, it is the BJP, which has had to face tough bargaining, initially from the Samata Party resulting in a sustained cold war between the two, and more so after the culmination of unity process.

With Ramvilas Paswan and Nitish Kumar coming under one umbrella, the dalit and the large sections of the BCs and EBCs vote bank is consolidating in their favour. While, the BJP has its stronghold in the Bihar plateau, where it bagged 12 out of 14 parliamentary seats in the 1998 elections, the Samata and the JD have their citadel in north and central Bihar. The BJP is contesting 29 seats altogether while the JD(U) 25 seats. The three new seats include Balia, Sitamarhi and Siwan. The seat adjustment pattern of this coalition clearly indicates an arcwise division of the state, i.e., the BJP is expected to perform well in the Jharkhand region, while the JD(U) is expected to steal the show in the north and the south (Table 1).

During last elections 18 out of 26 seats in the north Bihar were bagged by the RJD, Congress and the CPI and eight by the BJP, Samata and JD. This time, this position is likely to reverse, with the JD(U) contesting 17 seats and the BJP only nine. All the south Bihar seats have been left for the BJP, where the party even last time with 12 out of 14 seats. This is again reflected in seat-sharing pattern in central Bihar where the JD(U) is contesting eight seats including sensitive areas such as Arrah, Nalanda, Jehanabad, Aurangabad, and Vikramganj. In a dramatic development six small groups – mainly dissidents from different parties have succeeded in forming a front which is contesting 35-40 seats. The Samajwadi Loktantrik Morcha (SLM) consists of Bihar Jan Congress, Nationalist Congress, Janata Dal(S), Forward Bloc and Bihar People's Party. Some stalwarts like Jagannath Mishra, Ram Sundar Das, Tariq Anwar are likely to be in the fray. There is much discontent within the JD(U) especially on the issue of allotting ticket for Begusarai constituency in favour of Shyam Sunder Singh Dheeraj. The state secretary Ramjivan Singh has alleged Sharad Yadav and George Fernandes of emulating 'the Laloo cult' of taking such decision without consulting the local leadership. The complaint of ignoring the local leadership has been echoed in all the contesting parties, creating serious discontent among the local leadership.

The Left has always had a significant presence in whatever form in the political arena of Bihar. The electoral performance of the Left (both the traditional and the revolutionary over the last decade suggest some trends (Table 2). In 1989 under the banner of the Left Front the CPI won four and the CPI(M) and the MCC one each. The IPF won the Arrah seat on its own.

After Laloo Prasad Yadav ascended to power in 1990 the traditional Left (CPI, CPI(M), MCC) has always remained his ally. In 1991, the Left had a seat adjustments with the JD. The Left recorded an impressive performance bagging nine seats in Bihar, but the IPF lost Arrah, though recording over 17 per cent votes. The BJP got just five seats. In 1998 the RJD and the CPI parted ways and not only did the Left suffer a serious setback but the RJD could capture only 17 seats, while the BJP bagged 30 seats.

The CPI and the IPF would have performed better in 1989 elections but for the division of the votes among them. In Nalanda and Patna the division of votes between the CPI and the IPF not only prevented the former trend retaining the Nalanda seat and from gaining the Patna seat, to the advantage of the Congress(I) and the BJP respectively. The CPI had rejected the IPF's offer of forming a Left

Front in 1991 and refused to leave the Jehanabad seat for the IPF where it had polled over 1.5 lakh votes in 1989. On the other hand, the CPI chose to leave the Patna seat which it lost only by a margin of 25,000 votes in 1989 for getting that it had won this seat three times before. The IPF, though it lost Arrah, had polled in 1.16 lakh votes there, 1.13 lakh votes in Jehanabad and between 50,000-1,00,000

TABLE 3: MUSLIM VOTE

votes in five other constituencies, in 1991. The dalits overwhelmingly backed the IPF in 1989 and 1991 and it was this strength which worked to oppose the booth capturing and facilitating a fearless exercise of dalit franchise leading to the success of the IPF in Arrah in 1989.

What has prevented the CPI from rejecting the offer of the CPI(ML) Lib over the last decade is not difficult to understand. The IPF (and later Lib) represented the dalit and the poorest segment of the society, whose interests are in sharp contradiction with the middle (and now rich, as well) peasantry, which normally forms the base of the CPI. The same base is shared by the centrist forces with the socialist background, like the Janata Dal. It is not difficult to comprehend why the JD (or later RJD) becomes a 'natural' ally of the CPI, instead of the IPF (now Lib).

The Liberation is contesting 24 seats: seven in the north, 10 in central and seven in south Bihar. The New Initiative, a new entrant, is contesting one seat in Ranchi. The CPI is contesting nine seats, three each in all three regions; the CPI(M), two, one each from the north and central Bihar

and the MCC is contesting its single citadel in Dhanbad, where the New Initiative is supporting it.

The Liberation has a strong base in Arrah, Jehanabad and Siwan, yet it is contesting the highest number of seats among all left parties for technical reasons. It requires a minimum percentage of vote to be technically recognised as the state level party. Yet, the fact remains that the division of votes within the left parties is against the spirit of unity/federation between them.

The anti poll section of the revolutionary Left is busy in a poll-boycott campaign. Posters of the MCC and the People's War (PW) calling for an election boycott have appeared in the state capital as well. The MCC has called for 'changing this election into an arm-collection festival' to create people's army bases which may lead to a successful democratic revolution. The PW has called for "transforming this election into a protracted people's war which can liberate Indian people from the imperialist-feudal exploitation", because the electoral politics cannot eliminate poverty and offer a basic solution to the basic problems. The campaign by the

MCC has been on since early August in south-central Bihar and Jharkhand region mobilising people through village-level meetings, posters as well as through terror tactics using the armed squads. Though the MCC since its inception has been launching poll boycotts during each election, it has hardly been successful. This time, they appear to be planning a more ambitious campaign.

CHANGE IN THE OFFING

Out of 54 seats 22 are identified as electorally stable, i.e. almost neutral or unaffected by the changing tide (usually against the ruling party). The number of change neutral seats identified in north Bihar is nine out of 26, in central Bihar four out of 14, and in the south nine out of 14, across the state. During the last elections seven out of these 22 were bagged by the RJD and the Congress and 15 by the BJP, Samata and JD. All the 15 seats are expected to be bagged by the BJP-JD(U) coalition this time (like before).

Some 32 out of 54 seats have been identified as being change sensitive - 17 (26) in north 10 (14) in central, and five (14) in south Bihar. These are crucial for

changing the current political mosaic in Bihar in significant ways, which may further a change in the socio-political processes in the near future, because the unity among the JD and Samata has led to consolidation of the BCs-OBCs-dalit votes along with a powerful section of the upper caste votes, which is fiercely against Laloo Prasad and the RJD. Added to this is the upper caste base of the BJP in this region which completes the all-caste consolidation process creating a broad-based vote bank for this coalition.

However, all the 40 constituencies in north and the central Bihar (with a few exceptions) are going to be crucial for the dominant segments, i.e., the RJD and the JD(U), of both the coalitions. Though, as per the seat-sharing arrangements between the BJP-JD(U), the BJP is the dominant partner, social base by the JD(U) dominates in the north and central Bihar, and it is the change in these two regions which changes the power-configuration in Bihar. These 40 constituencies are crucial in terms of the nature of contest viewpoint as well. The two main contestants are directly pitched against each other, leaving either no room or very little potential for a third corner.

The bipolarity of this election is obvious in both the regions. As many as 20 (26) seats in the north are likely to have a direct bipolar contest. While the BJP-JD(U) coalition is perceiving gain in 'direct context', the RJD-Congress coalition is trying to create 'angular' contest situation in many constituencies for cutting the opponent's vote. For this, the RJD supreme is trying to establish an understanding with non-BJP small parties and independent candidates, who are in the fray. This time, while in north Bihar RJD-Congress coalition has to face a 'tough' contest, in the central region it is the BJP-JD(U) which is going to face rough in some constituencies.

In central Bihar only three out of 14 seats were bagged by the RJD, one by the Congress and five each by the BJP and Samata. It is not out of context to mention that the JD-CPI combine, in 1991 had bagged all the seven seats falling under Patna division with their main contestant being the Congress securing second position. By 1996 the political equation changed radically. The Samata was carved out of JD and joined hands with the BJP. The JD-CPI combine parted away. Two seats each from the JD and the CPI slipped into the palm of the BJP-Samata combine. In 1998 all the seven seats were bagged by the BJP-Samata combine. The political mosaic in this region radically altered.

The process of the loosening of the Muslim vote from the grip of the Congress(I) began in 1989. The Muslims voted en bloc for the NF-Left in the 1991 parliamentary elections especially in Kathiara and Betiah constituencies breaking the community barriers. This important segment of Bihari society enjoyed a better share of power and privileges under the Muslim-Yadav combine (MY) factor emphasised by the Laloo Prasad. One of the good deeds of the first stint of Laloo regime was sensitive and firm handling of communal riots, which consolidated Muslim franchise in his favour. The Congress has been the traditional banker of the Muslim vote in Bihar until it transferred to the Janata Dal under Laloo Prasad. The RJD-Congress coalition is naturally able to secure Muslim vote this time as well.

The contours of the electoral arena in south Bihar, which is going to the polls during its first phase on September 18, indicate that the contest is most likely to centre around the BJP, the Congress, and the Jharkhand Mukti Morcha. On sundry seats electoral veterans like Nirmal Horo (Khunti) and A K Roy (Dhanbad) are expected to brighten the contest. Efforts of building unity among all the Jharkhandi parties collapsed on August 27 with the emergence of two segments from among the Jharkhandi parties. While, merger of all Jharkhandi parties could not become possible, four small Jharkhand groups⁴ were able to forge a unity culminating into the formation of the Jharkhand Front. Now the JMM(S) and the Jharkhandi Front are going to contest all Jharkhand seats separately.

The triangular contest between the BJP, the JMM, and the Congress is expected in Chhotanagpur region stretching from Giridih to Singhbhum, though the first two are going to be the main contenders. The JMM is not for the first time over last two decades with a national party. It has also left Hazaribagh and Giridih for its rival group JMM(M) in a bid to accumulate the pro-Jharkhand votes. The position in Hazaribagh and Godda is going to be interesting where three 'secular' parties, i.e., the CPI, the Congress and the RJD will be fighting the 'communal' BJP, rather 'dividedly' (not unitedly) contesting one another. The JMM(S) and the JF are also going to challenge the BJP again 'dividedly' while contesting each other.

This time the JMM has to contest the joint alliance of its old allies, i.e., the RJD and the Congress. The Jharkhandi leadership is also caught in a dilemma over how

to access the voters with an ally in the RJD. While Laloo has vowed to allow bifurcation of Bihar only on his 'corpse', Sonia Gandhi has only lately supported the creation of a separate 'Jharkhand'. Against this the BJP support for Vananchal and the commitment of the JMM for establishing a Jharkhand identity are going to have a stronger impact over the voters of this region. Contestants like A K Roy and N E Horo are getting support from other democratic and ML forces active in the region. For instance, the CPI(ML) New Initiative is supporting both the candidates.

The performance of the BJP during the last elections, in which it had swarmed the bastion of its rivals JMM(S) in Santhal Pargana defeating the party president Shibu Soren from his homeland of Dumka and vice-president Suraj Mandal from Godda likely to be repeated this time, because unity among Jharkhandi parties may offer a tougher contest. The BJP has to face a tough contest from the Congress-RJD alliance, though a division of Jharkhandi votes may not be ruled out. The situation, in Jharkhandi is thus of a tripolar contest with the Jharkhand parties creating and consolidating a third pole.

Notes

- 1 For example, direct supervision of the printing of all Bihar ballot papers in Delhi and its transport into Bihar by an Air Force plane. Since 1996 political parties agents have been allowed to accompany the ballot boxes in transit from polling stations to storage points and to camp at these points till the counting was over, strict verification of the security seals, seal numbers, and signature of the authorised officials and polling agents, etc.
- 2 Another Rs 81 crore is sanctioned for the next assembly elections as well which is due in the first quarter of the next year.
- 3 According to home secretary U N Panjyari during the last elections (1998) only 129 companies of the paramilitary forces were available.
- 4 The united front of four parties: Jharkhand Mukti Morcha(U) Jharkhand Peoples Party, Jharkhand Party and Jharkhand Party(N).

DIVAKAR DEV
Chairman & Managing Director

It will be recalled that the year 1997-98 had witnessed impressive performance in the REC disbursement, profit and recoveries. In fact in many areas of its working, highest ever levels of achievements were reached. The Corporation's performance during the year 1998-99 has surpassed the previous year's commendable performance many times over. Salient features of this year's performance are:-

- a) The loans sanctioned during the year were for a total of Rs. 2878.73 crore compared to Rs.1213.68 crore, last year.
- b) The total disbursement during the year was Rs.2202.60 crore against Rs. 1093.81 crore last year.
- c) Recoveries during the year were Rs 2276.10 crore against Rs. 1155.57 crore last year.
- d) Profit (before tax and depreciation) went up from Rs. 126.74 crore in 1997-98 to a whopping Rs. 390.61 crore, even though the Corporation reduced its lending rates on almost all its loans by 0.5% to 2% p.a. during the year.
- e) The business per employee shot up to the highest ever level of Rs. 4.80 crore from Rs. 2.36 crore last year.
- f) Administrative expenses were brought down from 0.80 % of total business in 1997-98 to the lowest ever level of 0.37%.
- g) The total flow of funds to the central exchequer by way of dividend, interest, repayments and taxes exceeded the inflow through the budget by a sum of Rs. 99.53 crore. Similarly, the total payments made to other lenders by way of interest, redemption of Bonds etc. exceeded the fresh borrowings by a sum of Rs 82.60 crore. In spite of this negative inflow of Rs. 182.13 crore, the Corporation was able to more than double its disbursements.
- h) Priority Sector Bonds floated by the Corporation during the year were assigned AAA(SO) rating by two leading credit rating agencies namely ICRA and CRISIL.

11. Paid-up equity share capital	68060	63060
12. Reserves excluding revaluation reserves	89827	65306

NOTE: The Annual Accounts for 1998-99 were adopted by the shareholders in their meeting held on 14th September, 1999

- i) The Corporation proposes to pay dividend of Rs. 50 crore which is higher than the total dividend of Rs. 43.50 crore paid by the Corporation since its inception 30 years ago.
- j) For the 6th year in succession, the Corporation has earned EXCELLENT grading against the MOU commitments.

The above spectacular performance of REC has resulted essentially from initiatives taken in areas like portfolio management, cost reduction and recovery of overdue. In addition, to traditional programmes like village electrification and pumpset energisation, new products were added to the basket of loans for improving the overall yield. As a result, the weighted average return which had ranged between 6.57% to 10.71% during last 10 years, shot up to 13.66% during 1998-99. Simultaneously, the cost of funds which was 8.90% in 1997-98 was also brought

down marginally to 8.84% even though money raised through market borrowing during the year went upto Rs. 435.50 crore from Rs. 355 crore last year.

Rural Electrification

The Corporation continued to support traditional programmes of village electrification and pumpset energisation. The Corporation imparted new vigour to the Kutir Jyoti programme of providing single light connection to the household of rural poor. In addition, the Corporation has pushed up financing of investments in areas of system improvement and sm generation. The Corporation has identified documentation and material procurement as two weak areas in the implementation of the projects sanctioned by it, resulting in avoidable delays. To rectify these, the Corporation has introduced short term loans for procurement of materials and bridge loans pending documentation. The

measures have been received well and are likely to reduce the existing delays in project implementation by State Electricity Boards. Achievements under various rural electrification programmes are spelt out hereafter.

Village Electrification

A total of 2502 villages were electrified with assistance from the Corporation against a target of 2000 villages. Electrification of virgin villages was never a commercially attractive proposition for any State Electricity Board. With increasing pressure on their resources, and overwhelming need for containing losses, State Electricity Boards have been showing increasing reluctance in borrowing money on commercial terms for making investment in these works. This reluctance has resulted in slowing down of the pace of this programme which in the long run can have serious consequences, particularly in states where a large number of villages are still awaiting electrification. The strategy of financing village electrification works through commercial loans, adopted so far, needs to be reviewed and suitably changed. Govt.'s and Planning Commission's attention to this trend and to the need for evolving a new strategy has been drawn, and the matter is receiving their attention.

Pumpset Energisation

Against the target of 2,50,000 pumpsets the Corporation gave assistance for energising a total 2,79,201 pumpsets. This programme has already reached saturation or near saturation levels in the states of Andhra Pradesh, Haryana, Maharashtra, Punjab, Rajasthan and Tamil Nadu.

Kutir Jyoti

REC continued to distribute grant for single point light connections to be provided free to the households of people living in rural areas below the poverty line. During the year, a total of Rs. 49.17 crore was disbursed under this programme for as many as 5.30 lakh free connections given under the Kutir Jyoti programme.

System Improvement

It will be recalled that last year, attention was drawn to the increasing concern for quality of power that is being supplied to the rural areas necessitating in turn enhanced financial support for investments made for strengthening and augmenting the sub-transmission system. The total loan sanctioned for these during the year went up from Rs. 510 crore in 1997-98 to as much as Rs. 1658 crore in 1998-99. Similarly, disbursements went up from Rs. 346 crore in 1997-98 to Rs. 655 crore in 1998-99. This demand is expected to grow even further in the years to come and the Corporation has to prepare itself to meet the same. To optimise the return on investments made for improving the rural distribution systems, State Electricity Boards are being encouraged to look at the entire distribution system in a designated geographical area in

an integrated manner so as to identify the existing inadequacies and draw up a plan for their removal, in a time bound manner. The Corporation shall finance such projects under the newly introduced Comprehensive System Improvement Scheme. Additional features of such schemes would be realigning and strengthening the LT distribution network and installation of tamper proof and efficient energy meters, wherever required.

Small Generation

With growing realisation of the need for harnessing the potential for small local generation, the demand for credit for financing such investments is expected to grow rapidly. During the year, the Corporation sanctioned four small generation projects, two of which were to be in Leh and Kargil area of Jammu & Kashmir. Both these projects are designed to meet the energy requirements of these areas during the winter months, when hydro generation ceases due to freezing. These projects were sanctioned in November 1998 and now that the situation in those areas is returning to normal, it is hoped that the state govt. will be able to commence work on both these crucial projects soon.

Recovery of Overdues

It was mentioned in the last meeting that the Corporation has initiated dialogues with the State Electricity Boards and state governments defaulting in repayments. Of the nine states that accounted for a total overdue amount of Rs. 2604 crore at the beginning of the year, the Corporation has successfully negotiated and entered into agreements with four of them for recovery of their overdues as well as the outstanding amounts. These Boards accounted for a total overdue amount of Rs. 1073.42 crore at the beginning of the year, of which, a sum of Rs. 490.81 crore was recovered during the year. The balance amount along with the outstanding amount is being recovered in equated monthly instalments assured through an appropriate tripartite arrangement between the Corporation, the borrower and his main banker. This is a very important breakthrough which has not only resulted in flow of funds back to the Corporation but also in resumption of credit flow for new and on-going rural electrification works, in these states.

Changing Scenario

The Power Sector is undergoing major changes and the process has already begun. Regulatory Commissions have been set up and have started functioning in almost all the states. It is hoped that these commissions will, amongst other things, enable State Electricity Boards and their successor entities to reorient their policies and approach in a manner that will inject greater rationality

and commercial sense to issues pertaining to distribution and sale of power. Along with this, the process of unbundling the monolithic structures of State Electricity Boards into smaller and more manageable organisations and induction of private expertise into them has also begun. The progress may vary from state to state but the movement certainly is in this direction. Welcome as these developments are, they are likely to result in far reaching changes in existing organisations, policies and conditions for supply of power. The Corporation, having dealt, since inception almost exclusively, with State Electricity Boards, has taken note of these changes and is making requisite adjustments so that the Corporation's lending business, and the programmes that it supports, do not receive any setback. In this connection, steps have been taken to streamline the existing arrangement for scrutiny of projects received for financing by the Corporation and make it more objective and professional.

Village electrification and pumpset energisation programmes are not commercially attractive programmes. With the process of unbundling of the State Electricity Boards into smaller distribution companies and their subsequent privatisation, the future of these two programmes also needs to be assessed. At the same time, the investments made under them not being remunerative, it is apprehended that the private or joint sector companies could be tempted to give these programmes lower priority. Therefore, there is a need to evolve strategies which would be effective for sustaining these socially oriented programmes. The concerned state governments need to take note of this emerging possibility and come forward to assume greater responsibility in the areas of village electrification and pumpset energisation if the pace of these programmes in their states is not to be allowed to slow down. The Corporation has been flagging these issues before the Central and the State Governments.

Contribution to the National Defence Fund

Responding to the recent developments at Kargil, the officers and employees of the Corporation voluntarily came forward and donated one day's salary to the National Defence Fund. The Corporation supplemented this effort with another sum of Rs. 4.00 crore and thus the Corporation and its employees together made a contribution of Rs. 4,02,79,229/- towards the National Defence Fund.

Nirad C Chaudhuri: A Tribute and a Memoire

Neville Maxwell

Arguably Chaudhuri's great theme, threading through almost all his work, was decline – the decline and fall of empire, the stagnation and decline of social systems, the decline of western civilisation under the hooves of his "three horsemen", individualism, nationalism and democracy.

IN the late 1950s, when our paths crossed, Nirad Chaudhuri was living in a state of siege. The venomous reception in India of his *Autobiography of an Unknown Indian* had found lasting expression in an effective boycott, social and professional. He was unable to publish in India, except occasionally in *The Statesman*, then still British-edited, and the penury in which he lived was removed from destitution only by a fragile financial lifeline thrown to him by the French ambassador. Yet this diminutive, fiery man seemed never to be touched by depression or doubt, nor showed anything but relish and what he once called his "winged exaltation" in the battle with those who made themselves his enemies. In the airy, spacious flat he occupied for the four decades of his sojourn in Delhi, just inside the walls of the old city, near Mori Gate, he effervesced, an inexhaustible Roman candle of opinion, ideas, recollection, allusion; springing to take down a volume from his then great library, turning the pages to find, in the unmarked text, exactly the passage he sought to illustrate his thought; pouncing in clamant correction on an unsteady opinion expressed by a visitor then new to independent India. Chaudhuri in his later years was not a conversationalist. To his death at the age of 101 in Oxford on August (his last illness was very brief) he was instead a speaker, who would make spring-boards or trampoline of what his collocutor might offer. He was to be listened to, and enjoyed. The subject might be changed – the channel, so to speak – by an intervention, but the give and take of normal conversation was not what Chaudhuri offered. That would sound like the description of a bore only to those who did not know him.

Chaudhuri's intellectual range was immense, but two themes, or rather perhaps two relationships, may be selected from his voluminous writings: with Bengalis and, more broadly, Hindus (he preferred to call his compatriots "Hindus" rather than "Indians"); and with the British. So far as his own sense of self was concerned, he first counted himself a Bengali, not an Indian; but, towards the end of his life,

could write that "unforeseen and ineluctable circumstances" had made him inescapably "an Englishman" in spirit. At first he admired his fellow Bengalis, hailing them as "the first group of Indians who responded eagerly and actively to the impact of European civilisation on Indian life which British rule brought with it".¹ But as he watched, sadly, the relegation of Bengal in independent India, after its second and, he would say, lethal, partition, he came to look upon the Bengali middle class with contempt – a regard that for years was heartily returned in kind. That relationship ended with a sunnier chapter, however. Chaudhuri wrote much in Bengali in his last decades (and both he and his beloved wife Amiya Chaudhurani were delighted with the warm reception in Bengal of the memoir she wrote, in Bengali, of her girlhood), and felt a return to something like kinship. He would not have written of himself, as he did of Tagore, that "after abusing him as long as he lived, [Bengalis] suddenly discovered he was one of them"; and he took high satisfaction from the acclaim that at last he received in Bengal, while not forgetting that that was the moon – to use one of his favourite images – that reflected the sunshine of the honour paid to him in the west.

So far as his attitude to, and relationship with, the British were concerned, Chaudhuri was, first and foremost, an imperialist. He believed that an imperium could be a civilising force, and that the British Empire in India was just such, the "best political regime which had ever been seen [there], in spite of its shortcomings and positive evils".² The British were the transmitters to India of the impact of modernisation, and from that, he wrote, derived "the civilisation created by Indians in the nineteenth century under the impact of western influence" – of which civilisation, thriving still in the literature in English by Indians, Chaudhuri's own writings are among the very highest expression. That was the thought implicit in his infamous (in India) dedication of the *Autobiography*: to the memory of the British Empire in India to which its former

subjects owed "all that was good and living" within them. That was not a toady's offering to patrons, as many Indians charged, but rather the epigraph of the history of the decline and fall of the Raj which that volume and, especially, its almost equally great successor, *Thy Hand, Great Anarch!* comprised. For the British in India as a class, Chaudhuri had no time, indeed he wrote savagely of their insularity and snobbery, of the deformity of imagination which made them blind to the compliment Indians paid them in welcoming and making their own what the British offered. "It was the British community in India which prevented British rule... from completing [its] tasks. They made enemies of those who but for their folly would have become supporters of British rule..."³ Charitably, Chaudhuri ascribed the "cool and deliberate racial arrogance" of the British in India partly to fear, rooted in memory of the Mutiny, partly to their alien environment: "After experiencing the English weather I had no difficulty in understanding why Englishmen became so offensive in India, losing their usual kindness and equability in human relations. Their sense of proportion broke down, the habit of understatement disappeared, and they became extremists with an incredible stridency in their opinions, which became raw and crude. In many cases they degenerated into outright cads..."⁴ (Here one is reminded, not for the first time when reading Chaudhuri, of Nehru, who "refused to negotiate with Duncan Sandys because he is a cad".⁵)

He touched on those themes in his very first publication in English, an article in *The Statesman* of January 3, 1926 (this opens a valuable collection of his occasional writings edited by his son Dhruva N Chaudhuri in 1996⁶): "When after reading Bergson or Benedetto Croce, Thomas Hardy or H G Wells with a sense of intellectual kinship, an Indian comes across some instance of ignorant superciliousness in a European – be it in the shape of a remark in a book or a personal affront at the hands of a police-sergeant or of a tactless European merchant on the Maidan – he returns home in bitterness and wrath and his previous enjoyment of a European writer becomes to him a canker-ing reminiscence of his humiliation." (In lighter vein, he noted that a certain type of Englishman resented Indians' devotion to English literature as if it were "a sort of illicit attention to his wife – whom he was himself neglecting for his mistress, sport".⁷)

The autobiography's dedication is foreshadowed even in that early article: Long before the coming of the English, [India's] was an aged soul, rather decrepit

and weary of life, looking with fatalistic indifference on the rise and fall of nations and civilisations. The living continuity between its life and that of ancient Indians was broken. The old freedom of thought was gone. Literature, art, philosophy, were dead. The sole legacy from the past was a hard crust of tradition and custom from which the spirit had fled. When the youngest and most vigorous of civilisations made its inroad into this life of routine, all that was living in the old order responded to it.

Chaudhuri's personal experience of the inner politics of the Indian independence movement, gained while he was acting as secretary to Sarat Bose, left him with little respect for any of the leaders, and his basic approval of and sympathy for the Raj led him to positions which led to his being perceived as 'anti-national'. In the war years his support for the British cause and unshakable confidence in Britain's ultimate victory expressed in his radio commentaries kept him in opposition to the overriding view of his compatriots, who he wrote, were until very late "certain that Germany would win the war", pleased at Britain's early defeats, and somewhat chagrined at her ultimate victory. He suggests that that expectation of British defeat underlaid Indian unresponsiveness to the constitutional proposals brought by Stafford Cripps in 1942; and his analysis of the British government's action in bringing India into the war without consulting the nationalist leadership demolishes the widely held belief that that was a mistake, fatal to Indo-British relations. As early as 1938, he points out, the Congress, in session at Haripura, notwithstanding its condemnation of "fascist aggression", had resolved that any attempt to involve India in anti-fascist war would be resisted. On the eve of the war the party's working committee reiterated that stand, declaring "its determination to oppose all attempts to impose a war on India", because Britain did not "stand for freedom and democracy". Chaudhuri sketched what would have happened if Britain, disregarding the "absolutely unambiguous" position on the issue proclaimed by Congress, had sought its agreement to India being involved in the war:

The overture would almost inevitably have brought forth from the Congress requests for information and elucidation, a series of proposals involving the most far-reaching constitutional issues, and demands for guarantees of various sorts, coupled with a request perhaps that the post-war settlement of Europe should confirm substantially to the ideas of the Congress Working Committee's principal adviser on foreign affairs [Jawaharlal Nehru].⁸

Nehru was something of a *bete noire* for Chaudhuri. The two make an interesting comparison. Both described themselves as "Englishmen" ("I am the last Englishman to rule in India", Nehru told J K Galbraith, then American ambassador⁹). Nehru's Englishness derived from school at Harrow and university years in Trinity College, Cambridge, and should perhaps have been deeper than Chaudhuri's. The latter learned his English from Bengalis – and then, of course, from the masters of English prose – and was 57 when he first went to England; but it was Nehru who wrote that he was always conscious of his brahminical ancestry, while Chaudhuri as a young man wrenched himself free from the sense of being Hindu, and what he called "the Brahmanic Hindu feeling that the Hindu was superior to all other human beings". Nehru, Chaudhuri thought, while hating Hindu ideas and passions, had a "fatal weakness" – "incapacity to stand up to more determined colleagues and still less to Hindu fanaticism". That comment survived his expurgation of "most of the critical remarks about Nehru" from the draft of his *The Continent of Circe*, as did his sharp criticism of Nehru's rash vaunt about having ordered the army to take offensive action against the Chinese in 1962.

Perhaps it was for his propagation of what Chaudhuri always saw as the mirage of Indian 'secularism' that he most blamed Nehru. In 1961 he wrote that the Hinduism of the people was "so sure of itself that it does not care about self-assertion – which enables the present ruling class, too Anglicised by half, not only to proclaim the secular state but even to believe in its existence".¹⁰ Throughout Chaudhuri's writings one finds awareness, often prophecy, that communal Hinduism would one day come to political power in India. As this writer well remembers, such intimations were dismissed as absurd or malevolent by Indian intellectuals through the 1960s. Chaudhuri satirises the reaction to the voicing of such pessimism to "a member of the present ruling class: 'Rubbish' he would burst out, 'Hinduism is dying, if not already dead'". Now, of course, that ruling class is being absorbed by another, very different, and the 'Indian intellectual' of yesteryear has been replaced – or, often, has metamorphosed – into today's 'Hindu intellectual'. While Chaudhuri, in a long 1980 newspaper article republished in the collection compiled by his son, treats the "Hindu-Muslim Confrontation" as decreed by an unalterable historic destiny, rooted in the incompleteness of the Muslim conquest and the rigour, sometimes ferocity, of its oppression of the Hindus, he apportions blame for its culmination

in partition equally. While dismissing the Congress charge that the British created that communal conflict, he holds the British guilty of cementing and politicising it with the introduction of separate constituencies. He absolves Jinnah and the Muslim League from evolving the 'two nation theory', describing that as "really not a theory, but a fact of history brought out into the open by the growth of group consciousness of both Muslims and Hindus alike by their English education". (And there it seems that, like so many other writers on this subject, he omits to note that it was V D Savarkar, the ideologist of Hindu nationalism, who first described Hindus and Muslims as "two antagonistic nations living side by side in India".¹¹) The basic aim of the Muslims in India, Chaudhuri wrote in 1936, was only to "maintain their identity as Muslims in a society parallel to that of the Hindus"; but the latter were "not ready even to consider [that aim] as legitimate", and "totally and uncompromisingly rejected it".¹² It was not Chaudhuri but Joya Chatterjee who wrote that "bhadrakal Hindus preferred to carve up Bengal rather than to accept the indignity of being ruled by Muslims" and thus be bereft of their power and privilege,¹³ but Chaudhuri would surely have agreed.

After the failure of the Cripps mission Chaudhuri, who never allowed the lowliness of his social position to restrict the range and ambition of his writing, began a memorandum to Cripps warning that those who would inherit British power, the middle class intelligentsia, were unfitted by their aptitude, experience and system of values from launching the social and economic revolution India needed. Their rule would "spell ruin for India".¹⁴ The problem he foresaw was that, as Edward Shils, his friend, admirer and generous benefactor, put it, "upper caste Hindus, from whose circles most Indian intellectuals are recruited, [are] fundamentally and humanly insensate to the mass of the population who belong to the lower strata".¹⁵ The late Myron Weiner, in his explosive study *The Child and the State in India*, traced the malign and oppressive expression of that disengagement of the Indian elite from concern with the lot of the poor – indeed their deliberate, if sometimes unconscious, policy of keeping the poor uneducated, and therefore poor.

The range and richness of Chaudhuri's learning and interests makes it difficult to limit comment on his ideas – his complete works would be a splendid resource for someone marooned. Here one may mention two last themes.

Chaudhuri saw "Hindu militarism [as] a genuine and powerful force, influencing

Indian foreign policy".¹⁶ The border conflict with China was "inspired almost wholly by Hindu jingoism", he wrote, "with the Hindu possessiveness as a second underlying factor". The "martial Hindu soul spoiled for a fight". During the first half of his writing life he tried to introduce his compatriots to military culture, which "combined knowledge and intelligent appreciation of the factors involved in war". In that attempt he came to admit defeat: Hindus' "ignorance of military matters remained as complete as ever, but their bellicosity grew". Somewhere he noted that the seriousness and international danger posed by that "sub-rational, out-of-date, and yet insatiable militarism" was limited by India's military weakness—an opinion he must certainly have reconsidered in the light of last year's developments in south Asia.

Arguably Chaudhuri's great theme, threading through almost all his work, was decline – the decline and fall of empire, the stagnation and decline of social systems. It haunted him, he wrote, like the poet's foul fiend, treading close behind. Fittingly, his final work, *The Three Horsemen of the New Apocalypse*, written in his 99th year, treats it at some length.¹⁷ Perhaps because this work was published only in India and circulated in Britain in

the carelessly printed Indian edition there has been a tendency to overlook its worth (and admittedly there are passages in which Chaudhuri's lucid asperity degenerates into curmudgeonliness). But it is a worthy coda, its always relevant citations comprising an anthology of his immense reading, and the focus broadened here into global range. And above all, while his prime subject is the decline of western civilisation under the hooves of his "three horsemen", individualism, nationalism and democracy, here are to be found Chaudhuri's *pensees*, poignant, shining and, in the literal meaning, encouraging, on death, which by then held him by the hand. Challenging the moralists and poets for whom "the paths of glory lead but to the grave", he notes that: "The earth that was thrown on the head of Pascal has not buried his fame; Gray's *Elegy* is still read and was read by [Chaudhuri] as a boy in rustic Bengal; Shelley's garland has not, even in four centuries, withered on his brow". Thus posthumous fame, which Nirad Chaudhuri surely will long share, endows life with purpose; and, the closing page of the first volume of his autobiography reminds, beyond that, there was for him, as for us all, "the ecstasy of having lived and been alive for a moment".

Integration of the Indian States

V P Menon

When on 15 August 1947 India became Independent, one of the largest unresolved problems facing it was the presence of 554 Princely States. The British Government had announced that with their departure these States would become independent. It was widely feared that India would break up on this account. Yet, by the time the new constitution came into force on 26 January 1950, all the States had been integrated into the pattern of the Republic. This book is the first authoritative account of that magnificent achievement.

The Transfer of Power in India

V P Menon

The story of the transfer of power is covered in this book from the outbreak of World War II in September 1939 to the beginning of a new phase of Indian history on 15 August 1947. The narrative deals with the Cripps negotiations, the 'Quit India' resolution of 1942, the Simla Conference, the Cabinet Mission, the Interim Government and the Union Constituent Assembly. The book ends with an account of the communal conflagration which followed immediately after partition.

Agonies and Dilemmas of Corporate Aggrandisement

Frederic F Clairmont

The recent takeover of Paribas and the Societe Generale by Banque Nationale de Paris will generate one of the world's biggest banks and no doubt trigger further consolidations. This trend of concentration will not provide stability in the international financial realm, but will only deepen the current economic crisis.

IT was baptised a marriage *a trois*; in reality it was a shot-gun wedding that spawned the biggest corporate aggrandisement in French history. The triumph of the Banque Nationale de Paris (BNP) that grabbed Paribas and the Societe Generale in a hostile takeover bid ushers in one of the biggest and far-reaching mutations in French finance capitalism and international financial markets. The merger of these three institutions will generate one of the world's biggest banks with a combined stock market capitalisation of \$ 57 bn and more than one trillion dollars in assets. Indubitably this merger will trigger further massive consolidations throughout the financial service sector and beyond. In so doing it will contribute massively to the further economic and social polarisation of France.

Of the 11 major French commercial banks BNP and its two merged corporations will now account for over 42 per cent of the aggregate assets of the 11 major French commercial banks. The remaining nine will either be gobbled up by foreign or domestic predators or be integrated among themselves. At any rate, what this means is that given the present tempo of corporate annexations that has engulfed every economic sector it appears unlikely that there will be more than three or four major commercial banks around in the very short term.

The frenzied tempo of concentration in France of which the BNP aggrandisement is the highest expression has been galvanised under the familiar platitude of shareholder value. It is a 19th century concept used by The City to refer to the maximisation of profits of a company's shareholders. The merger and acquisition movement has many theoretical and institutional facets. But its *raison d'être* must be sought within the dynamics of the process of capital accumulation and disaccumulation at both national and international levels.

Nothing more clearly reveals the fren-

zied tempo of concentration than the long, vulgar six-month propaganda war for the control of the nation's three major listed companies. The size of the financial outlay is nothing short of staggering. Collectively the trio spent an estimated \$35-40 million on media advertising alone. To these Himalayan numbers must be added the costs of financial service parasites that normally feed at the mergers and acquisitions through. These include the M and A specialists in the big investment banks, the public relations hustlers and accountancy establishment and the high-priced battalions of lubricious corporate lawyers. This would bring the aggregate to around a modestly estimated figure of \$ 60 million. And given the fact that the deal was promoted by Social Democracy and the finance ministry these costs it may be presumed are tax deductible.

This pace and manic expansion of concentration with its attendant gruelling economic and social costs is by no means unique to the French financial bourgeoisie. In the case of Malaysia the grand strategy of prime minister Mahathir as it called is to consolidate the biggest 21 commercial banks into six by the end of September 1999. As in France the big six have already been labelled 'national champions' destined to beat back the competitive onslaught of transnational banks. A Chinese Malaysian banker succinctly puts it this way: "We have confidence in Mahathir. There will be a greater and greater degree of co-ordination at home and abroad of our banking policies. This is the only way to survive and flourish."

What Mahathir's grand game will accomplish is that it will vastly consolidate the national bourgeoisie that is already tied to the national political party. Hence it will have served a dual economic and political objective. This is the grand payoff. In addition, 25 financial groups and 12 merchant banks will also be welded into six financial institutions. But that is not the end of the consolidation road. The

Malaysian Chinese banker puts it with a logic that makes sense from his perspective. "Obviously we shall aim to whip all of these integrated units into viable institutions but that will take time. What we must not lose sight of is that there is nothing sacred in the number six. As far as the party and I am concerned the nation will need no more than three big banks in the future. We'll be positioned to beat back the foreign banks and penetrate other financial markets." This is the implacable logic of the marriage of big politics and very big money to ensure that the money gets bigger and bigger all the time.

Just prior to the end of the hegemonic battle of the big French trio another major international merger occurred – this time dubbed a 'friendly merger' – of some of the world's biggest aluminium producers: Alcan, Pechiney and Alusuisse Lonza. The deal would facilitate the costs savings of \$ 600 million. Given the fact that labour costs account for a sizeable segment of costs such 'savings' could only be realised by a sizeable liquidation of the labour force by around 7-10 per cent. This is the normal trajectory of the transnationalisation of capital. It was not surprising that immediately after the big deal was announced Alcoa, the world's biggest producer, with 50 per cent of US smelting capacity, struck back with a hostile bid of \$ 6 bn for Reynolds. If that corporate grab were consummated Alcoa would still be world's leader. A game however that is not yet over.

Systematic liquidation of the labour force is a corollary of corporate restructuring. The TNC has ceased to be a generator of jobs. It is a job liquidator. It is a fallacy of certain BNP protagonists that there will be no job losses when the deal is pushed through. No doubt Michel Pebereau, BNP boss, has among many of his great virtues the ability to read a balance sheet and to understand what it says or does not say. And he knows that one way of improving the balance sheet is slashing labour costs. Labour liquidation by the modern corporation is therefore not an aberration but rather one of the essential tools of 'scientific management' as preached by Frederick Winslow Taylor at the century's turn. It is capitalism's declaration of class warfare. From the standpoint of corporate strategy labour liquidation (matched ideally by a fall in real wages) spells a boost in profits or shareholder value, the current cliché.

The point was well made in *Newsweek* (February 26, 1996) in an article entitled 'The Hit Men'. An expression first used

by the Chicago police to describe Al Capone's gangsters. The article describes the extent to which 'the hit men' are operating from the ranks of the leading corporate behemoths. "You lost your job, your ex-employer's stock price rises. The CEO get a fat raise. Something is just plain wrong when stock prices keep rising on Wall Street while Main Street is littered with the bodies of workers discarded by big corporations like AT and T and Chase Manhattan. Today, the more people a company fires, the more Wall Street loves it and the higher its stock prices go." The author's moral indignation is well taken. What he failed to grasp is that there is 'nothing plain wrong' about the operation of the system. Indeed, it conforms to the inherent dynamics of the engine of capitalist accumulation. A logic that BNP and its triumphant strategists and their social democratic backers have no doubt embraced.

Of the nine selected chief executive officers (CEOs) cited as corporate 'hit men' it was reported that their base salary was \$1,835 in hut which does not include stock options and other bonuses. When these are added it would escalate their annual income average earnings beyond the \$5 m mark. During the interval (1990-96) in which these 'hit men' operated they had liquidated 3,05,000 employees. Recall just nine corporations.

The gluttonous feeding frenzy of the transnational corporation continues at an unabated pace. Creation of 'national champions' is part of this quest. There have been remarkable historical precedents. German social democracy in the 1920s, as its French counterpart today, pinned its industrial and financial strategy on the creation of national corporate champions that would raise Germany to great power industrial status. The most successful marriage *a trois* (December 1925) was that it integrated by massive tax and other benefactions the three leading chemical corporations: BASF, Bayer and Hoechst under the umbrella of I G Farben.

The merger immediately triggered counter-concentration mergers such as that led by Imperial Chemical Industries (1926) and Rhone Poulenc (1929). The creation of 'national champions' was to be pursued by the Nazis and became the centrepiece of their national economic policy. I G Farben and Volkswagen and Deutsche Bank are merely illustrative. In the footsteps of German social democracy what Nazi economic policy amply succeeded in doing was that it facilitated the massive concentration of capital and its offshoot

the German bourgeoisie in its forays for greater internal and external market share. And national power. The creation of national champions and the frenzied drive for 'national solutions' became, then as now, a bludgeon to beat other economies into the dust. It was part and parcel of those helligent economic policies that Joan Robinson of Cambridge University, designated in the 1930s as 'beggar my neighbour' expedients.

The avalanche of corporate aggrandisement surges on inexorably. From the start of this decade to the end of 1999 the cost of these mergers and acquisitions worldwide will have surpassed 7 trillion dollars. The enormity of the costs of these vast corporate aggrandisements can better be appreciated by the fact that these numbers already exceed US GDP. The impetus to this unbridled and wholly unaccountable thrust of economic concentration in both the financial and non-financial sectors stems from a concatenation of interlocking forces of which the most glaring is worldwide over-production or over accumulation.

What is to be done with the surplus capital generated? Where can it be invested and at what rate of profit? The case of US mega banks is suggestive of their dilemmas. Due to the longest US cyclical upswing in the 20th century and booming capital markets the mega banks are accumulating capital that is nothing short of dazzling. Citicorp and Chase Manhattan, for example, each reported a 24 per cent return on equity in their latest quarter. These vast sums cannot be deployed to expand the balance sheet although as much as four-fifths of mega banks are already buying back stock.

The most appropriate strategy to prevent a fall in the rate of profit is recourse to acquisitions and diversification seem in Chase Manhattan search for very large investment banks and Citicorp's move into insurance. Given the stupendous costs of these takeovers such acquisitions are becoming more arduous. The predators are running short of prey. Stimulating also the push to M and A activities has been the prodigious growth of pension funds. According to consultants InterSee Research world pension assets were around \$1 trillion in 1998 and are expected to top \$15 trillion by 2003. Much of the US pension funds have already bitten heavily into Societe Generale and BNP. Which must be weighed when advancing the thesis of 'national champions'. About 10 per cent of US pension portfolios are invested outside the US and hence they have become

crucial catalysts in world stock markets and the merger and acquisitions frenzy.

The pace of such corporate predations is facilitated by the speed of deregulation, privatisation the policies of the WTO which like the IMF and the World Bank are economic appendages of transnational power. No less important has been the advent of the Euro and the Maastricht Treaty that have given a fillip to corporate expansion by vastly curtailing the powers of national sovereignty. Acquisitions gives the corporate world a respite. The juggernaut of capital accumulation and competition is pushing for greater concentration. In 1983, this was clearly articulated by the chairperson of Citicorp: "We don't want to be No 1 in assets; we want to be No 1 in profits and profitability". He then added the clincher. "Our strategy is not one of making loans; our strategy is one of making money" (*Business Week*, May 16, 1983). Given the magnitude of over-production small sectors money can best be made by speculation and acquisitions.

Stimulating the drive to concentration is the current deceleration in the world economy. The sharp fall in prices is generating a cumulative deflationary spiral that has already acquired a self-reinforcing momentum. Accelerating the drive to concentration has been the upsurge in deflation defined as a systematic fall in the general price level seen in commodity and producer prices. The world automobile industry is already afflicted with one-third unused capacity. New auto plants are still however coming on stream. Brazil, an impoverished country, is subsidising Ford to the tune of \$730 million to install a new plant. According to the *Economist's* (February 20) estimates China has around two-fifths excess capacity in manufacturing. The global glut will push prices lower as countries and firms continue to produce at paper-thin rates of profit.

The growth of concentration of the BNP is a glaring example of what is transpiring throughout the financial sector – and elsewhere. The sheer scale of such massive capital concentration has largely bypassed regulatory control and largely explains the criminalisation of global finance capital. Such deployment of corporate economic muscle is incompatible with democratic practice. These strategies are pushed through by a tiny cabal of individuals in the interest of a tiny minority of powerful shareholders. The strides in concentration will not provide stability but to the contrary will deepen the current economic crisis.

Organised Crime in Russia

Shobha Gackwad

When Russia began economic liberalisation, it abandoned the socialist system without putting in place an alternative. This was fertile ground for economic crimes. Powerful politicians and bureaucrats took control of economic enterprises. There was uncontrolled parallel economy and organised crime took hold and spread. Embezzlement, murder, drug trafficking and arms smuggling have become a part of life in Russia.

OFFICIAL reports of the last years of Soviet command economy under Brezhnev clearly convey that the state was fulfilling plans beyond 100 per cent. It is common knowledge that such overreach could be feasible in few select sectors of the economy; but such achievements in all the sectors over a period of time were well-nigh impossible. In order to please the central high command, the Soviet accountants cooked their books at all levels. Starting from the republic level to the smallest Kolkhoz, they doctored the data. As a result, real growth was not visible and the economy came to a grinding halt in ensuing years. Gorbachev attempted to revive the economy with liberalisation. But the overall situation rapidly deteriorated to the extent of political revolt leading to armed confrontation and finally disintegration of the USSR.

With disintegration, the independent nations had to face the travails of new statehood. The unknown method of capitalist economic governance added to their woes. Each republic had decided to do away with the socialist economy without creating an alternative economic system. This had led to chaos and generation of uncontrolled parallel economy. Probably, this was the beginning of all kinds of organised crimes in Russia. Although organised crimes existed in the former USSR its magnitude and intensity were invisible. Yet we know of a few cases where top bosses were involved in the racket of manufacturing in government factories many items like fur, arms and timber and then exporting them to the west through official channels and illegal means. The profits thus accrued were pocketed by these big bosses or stashed in European banks (Frohlich Norman and Joe A Oppenheimer (1997): 'Ethical Problems When Moving to Markets: Privatisation and Entrepreneurship' in A A Ullmann and A Lewis (eds), *The Managerial Challenge in Central and Eastern Europe*, International Business Press, New York). These crimes came to the notice

of high command in USSR and perpetrators were caught and executed after a short trial. The details of trials were not released to the public at that time but now in liberalised times, these details are available with various state archives (newspaper *Zerkalo*, July 5, 1997; Records of trials of economic offenders, Azerbaijan Republic Archives).

The party bigwigs were the first ones to take advantage of the policy of liberalisation. Overnight these people became technocrats and managers of various enterprises. They were free to operate without any control. These people made millions in the absence of any real law to govern the activity of import and export. A rough estimate suggests that during 1990-96, Russian businessmen and fake Russian companies had stashed away in Switzerland nearly 800 billion US dollars. Crime has thus become a part of life in today's Russia.

'Submerged Part of Criminal Iceberg: 7 Million Crimes a Year' was the headline recently in the newspaper *Slovo* that depicted the nature and magnitude of crime in Russia. The article went on to describe that about 10 million crimes were committed in Russia every year; a figure that stands far above the number of officially registered crimes pegged at only three million. These data were quoted by the newspaper from the statement to the press, by the deputy minister of internal affairs. A more interesting detail about the crimes was the cause of perpetration: about 30 per cent of the crimes in Russia were committed under the influence of alcohol and roughly 10 per cent under the influence of narcotics or psychotropic drugs (*Slovo*, January 27-28).

According to the deputy minister of internal affairs in the Russian Federation, Valery Feodorov, since 1990 the ministry has been functioning under great stress due to continuous and sharp increase in socio-political tensions and economic difficulties in the country. The ministry's staff are facing unprecedented rise in crimes

and armed internal conflicts. This has put tremendous strain on the police personnel who are also facing financial difficulties pervasive throughout Russia. Further, with this rise in violence and crime, the police is facing a shortage of trained personnel to combat crime on the social front. The most worrisome factor is that the criminals are getting better and better armed. This makes them less afraid of police or the law. Only this year the Russian Federation police has lost 244 policemen on duty and 442 have been injured while tackling criminals; many of them may not even return to active duty. Such colossal waste of manpower is a factor worrying the planners in the government. According to the deputy minister "In this war against crime, criminals should be eliminated; not the policemen" (*Slovo*, January 20-21).

Today pick up any newspaper in Russian you will find it reporting some of the major crimes committed in Russia in the last 24 hours. They also report a follow-up of some major crimes committed earlier. Since the liberalisation of economy in Russia, economic crimes have increased manifold. Barely one-tenth of all crimes committed are detected, and on follow-up, probably less than 1 per cent criminals are punished. This is due to the fact that politicians, bigwigs in the government and oligarchs protect the criminals or are themselves actively involved in committing the crime. Many a time investigators are frustrated because at some crucial juncture they are asked to drop the case or look elsewhere or are transferred to other duties or asked to co-operate to save some nice people from embarrassment. At present, many oligarchs have been involved in many crimes such as embezzlement of funds of all kinds of state and private organisations, killings of rivals, informers and trafficking of drugs and arms smuggling from Russia to different buyers abroad. Murder and mayhem have become the order of the day. Criminals are in a hurry to amass wealth and power in the new Russia, and it is quicker to kill than to intimidate or bribe.

According to *Daily Telegraph* of London, money, illegally brought in from the Russian Federation to Great Britain in the last three years, amounts to about 90 billion pounds. This is certainly criminals' money (February 24). The roots of many of these crimes go back to the years of stagnation of the Soviet economy, and the subsequent introduction of market economy.

Since March this year, Russian newspapers are full of news about the investigations of connections and activities of well known persons like Boris Abramovich

Berezovskii – formerly a close Yeltsin aide and secretary general of the CIS; Nikolai Glushkov – former deputy general director of Aeroflot; and Alexandr Smolenskii – former chief of the SBS-AGRC bank. All three of them were accused of economic and espionage offences committed against the state. They were accused of syphoning off foreign currency funds of the aviation company 'Aeroflot'. In the last four years, these men had syphoned off nearly 400 million US dollars from funds of banks and Aeroflot. Smolenskii was accused of syphoning off nearly 32 mn US dollars to various accounts abroad by using falsified documents. His partner in crime, chief of Jambul Bank, Lev Nakhmanovich was arrested in 1992, but the then minister of internal security, Victor Barannikov himself interceded on his behalf and as result, he was released. He immediately fled Russia and the case against Smolenskii came to a grinding halt. Only in November 1998, after the extradition of Lev Nakhmanovich from Switzerland to Russia, where he gave evidence against his former partner-in-crime Alexandr Smolenskii about his modus operandi to stash money abroad, that some headway was made in the investigation. Now Alexandr Smolenskii is a wanted man in Russia but in the absence of any extradition treaty with Israel, Austria and a few other countries, he cannot be booked. He is operating in these countries as a good businessman and a big investor, holding citizenship of both Israel and Austria (*Slovo*, April 9-13). These countries will not agree to the extradition of Smolenskii and his accomplices. Added to all this, there are people in the government who will protect such criminals for their private gain or under the influence of organised criminal gangs operating throughout the country. As minister Feodorov described: "The moral degradation of the Russians is gradually leading to total criminalisation of the society"

According to estimates by criminologists and various organisations fighting organised crime in Russia, there are about 6,500 groups and gangs owing allegiance to about 3,000 group leaders and about 279 'godfathers'. There are about 1,00,000 members in Russia and western Europe.

There is a separate group of Russian criminal gangs operating in the US. This group has ties with criminal gangs in Russia but they are closely connected to the South American mafia. These gangs terrorise ordinary people and call themselves mafia of the place where they are operating such as Moscow mafia, St Petersburg mafia, etc. (interview with Marshall Goldman,

Radio Liberty). There is enough evidence to prove that within Russia, the Russian mafia has spread its tentacles, and there are plenty of factions running various activities within and beyond Russia. There are Russian groups, Chechen groups, Azerbaijani groups, Armenian groups, Georgian groups and scores of other groups generally based on local nationalities of erstwhile USSR in most of the major cities in Russia. Many groups have formed unions with similar ethnic groups of other cities. Most such groups have their 'dons' in Moscow. These 'dons' control a wide network of criminals in Russia and abroad. Some of the top government officials and officers in the armed forces have been identified as 'dons'. The mafia government official nexus is very strong due to various reasons such as threat, monetary gratification, blackmail, etc. The Russian mafia is firmly entrenched in drug business and has contacts in Pakistan, Afghanistan, former Soviet republics like Tajikistan, Uzbekistan and Turkmenistan. These contacts spread all the way to western Europe in Spain, France and many other countries. They pick up drugs from Pakistan and Afghanistan, use their conduits in Russian border guards (201st division of the Russian army on Afghan border) in Tajikistan and local border guards (Pogranichniki) in Uzbekistan to transport drugs to Russia and beyond. They have started giving a tough time to Afghan and Pakistani gangs as the Russian gangs are better organised and more ruthless than any other gangs operating in this space.

As per the data from the ministry of internal affairs of Russia "in 1992 more than half of the criminal groups had contacts with the government structure [apparatus]. This had made it difficult to differentiate criminals from honest government employees and made it easy to call such government the criminal state" (Edward Royce, speech in the US senate).

A cursory look at the American reaction to the growth of criminals in the US with Soviet or Russian origin provides us with a picture of panic. Press reports collected from various US newspapers in the last three years reveal that there were about 1,000 big bosses from the erstwhile USSR living and of 'rating criminal rings from Los Angeles and San Francisco. Russian mafia gangs are now operating in about 50 countries. About 80 per cent of the stock market shares issued in the Russian Federation are in the control of these gangs. US \$ 20 billion obtained from criminal activities are being laundered in the west by the Russian mafia. This fuels the pervasive American fear of Russian gangs.

The US press talks about the Russian mafia, Chechen mafia and a whole lot of other gangs active in the US, but there is not a single word about New York family, Chicago family or mid-west family that are the US mafia (Cosa Nostra).

Reports from Europe and former eastern block countries tell us a different story. Data compiled by European Organisation against Organised Crime show the break up of crimes committed by former Soviet and east European nationals.

Nationality	Crimes Committed (Per Cent)
Trans-Caucasian nationals	30
Former Soviet Jewish nationals living in western Europe	20
Chechen groups	15
East European nationals	11
Baltic emigre in western Europe	6
Russians	2
Others	16

Based on reported crime data published in the UK, France, Scandinavian countries and Germany the above does not support the had reports against Russian or former Soviet nationals. Rather this report provides a new perspective to the whole phenomenon of crime and criminals in modern Russia, leading to such basic questions as genesis, growth and extent of crime and how it has become so in post-Soviet Russia in such a short time.

Organised crime is harming the Russian society financially, socially and morally. The erosion of social and moral values is widely felt all over Russia. The party apparatchiks had lived better than ordinary citizens in socialist years. Those very same people have now cornered the enterprises and are selling the country blind. Once again they are better off than ordinary people in Russia.

With the economy of the nation at its worst in this country, the country's leadership has been trying to reform and streamline economic affairs. "The government is trying very hard to modernise the tax laws, governance system of banks and general health care system, improve consumer services, develop mercantile system of the country." While these steps are being taken under severe pressure from international organisations like OCED, EBRD, IMF, World Bank and Paris Club, Russia's credit rating in world economic community remains very low. The economy is very sluggish at the moment. Simply replicating any foreign system in Russia will not succeed. A new economic system compatible with Russian traditions but not limited by them will have to be devised and nurtured for a long time to make it work for the prosperity of the nation.

Food Security in Hindukush Himalaya

Shantanu Nagpal

The people of the Hindukush Himalayas have given up their traditional environment-friendly agricultural practices in favour of market-oriented cash crops. As a result, while population has grown, agricultural productivity has not increased and resources have been degraded. Food availability has declined. A way out is to commercially use the biophysical features unique to the areas while protecting the environment.

HINDUKUSH Himalaya (HKH) ranges cover an approximate area of 3.4 million square kilometres and a population (in 1991) of about 118 million. The countries covered in this area are Afghanistan, Bangladesh (Chittagong Hill Tracts), China (Tibet, parts of Yunnan and Sichuan), Bhutan, India (eight states), Myanmar, Nepal and Pakistan (NWFP, FATA and parts of Baluchistan).

The concept of food security—the ability of an household to get access to enough food for all its members, either by producing it or by earning enough to buy it—has been given a new meaning in the food deficit regions of the Hindukush Himalayan ranges. The shift has been away from aid for subsidising subsistence agriculture (growing it at home) to aid for exploitation of the niche (special exploitable features like hydel-power, tourism, vegetables) that these hills offer. Thus instead of concentrating on staple foods, farmers are encouraged to grow high value crops which will contribute to their incomes and thus their food purchasing power.

The shift was inevitable. Decreasing returns from existing agriculture meant that farmers could survive for eight to nine months a year on traditional food crops (maize, rice, millet, wheat) and had to search for non-farm income for the rest of the year. With overextraction, overgrazing, intensive cropping, came dramatic declines in soil fertility and emerging signs of unsustainability in these regions. Spurred by success stories in Himachal Pradesh and parts of UP, governments and NGOs focused their efforts on high value agriculture. It made sense, it was accepted economic theory—increase entitlements (incomes) from existing endowments (land, labour and capital).

Yet all indicators now show that niche harnessing can be equally debilitating for the land and could lead to a situation where land is unable to regenerate itself and thus become unsuitable for agriculture.

Niche harnessing has raised hopes and raised incomes (for a few) and also dealt with the problem of food security. What it has also done is decrease collective responsibility, further destroy traditional methods, increase risk and vulnerability, and accelerate the breakdown of social sanctions on the resource base that communities had maintained over the years.

The fault lies in the way traditional systems have broken down, and governments and NGOs have focused on supply without concentrating on demand or the special features of the mountains regions.

"All policies are made in the plains, for the plains, by politicians from the plains. Mountains are seen as liabilities that need nagging attention," says N S Jodha of the International Centre for Integrated Mountain Development (ICIMOD), "it is no surprise that these policies are made assuming what works well in the plains, should work in the higher mountains." That, in essence, is the problem of the people living in the HKH. For policy-makers, mountains are a valuable resource base for meeting the needs of the plains. They generate electricity, tourism, food that can be sold in the plains. They are sparsely populated, low vote bank areas, with marginal communities that need far too much energy and attention to be worth the effort. For the same investment, far more votes could be generated in the plains. If it had not been that these are people we are talking about, we could have couched this problem in the classic 'market failure' model of economics. Perverse as it may seem, that would have been the real definition of the mountain people: market failures that need special attention in democratic market.

According to Jodha, mountain areas are special because they are fragile (difficult to recoup losses, susceptible to irreversible damage), inaccessible, marginal (low productivity, fragile, high cost of maintenance) and diverse (high internal heterogeneity

that requires individual attention). These factors limit the production and exchange options available to the mountain people. Thus any application of traditional food or famine theory is difficult in these areas.

Despite their biophysical drawbacks, a substantial number of people has survived in these areas. This has been largely because they developed traditional methods of adapting their needs and mechanisms that preserved and regenerated their resources (Appendix 1). For instance, in Bhutan, demand was controlled through traditions like sending the eldest son to become a monk and through polygamy. In other areas demand was controlled through migration. Overgrazing was controlled through strict time sharing mechanisms, which limited the time available to each farmer to graze his cattle in the commons. Disputes were resolved by communities, which gave village elders the authority to resolve the disputes. Now the same disputes would be resolved by civil servants who set the rules based on what they have learnt in the plains. All petty trade activities were on a small scale and were interlinked. This meant that no one had an incentive to intensify resource use because the returns were limited.

Most importantly the consumption and production choices were far greater. There were far more varieties of crops that were grown and consumed and this meant that the soil had a chance to regain its fertility. During the time the soil was rested, farmers survived on roots and shrubs which although less nutritious, met their food needs. All this changed when the government introduced its 'grow more food', campaigns and public distribution system, which limited the number of crops to three or four and thus limited the production and consumption choices of the people. Now, they produced only the three of four varieties that could be sold through the PDS and thus consumed only what they produced. Government help came only if the farmer grew high yielding varieties, which required intensive agriculture. Mixed cropping decreased, fertility came down, and the farmer was made dependant on fertilisers which only the government provided. Jodha explains how state intervention has bound the people to choices which were never their own. He says that although food security under the new state intervention, with its emphasis on entitlement enhancement, has decreased famines and improved household food availability, it has come with a huge cost to these fragile mountain areas.

Food varieties that contributed to the diversity of the region have completely disappeared. This is because state incentives encouraged farmers only to produce one or two crops (rice or wheat) while completely neglecting the other crops that they used to grow and eat. As a result, the farmer grew only what he could sell or what he got external support to grow. As a result, households which used to consume over 20 varieties of food items now consumed five. The food items that disappeared were the ones that were environment friendly, resilient, grown to increase soil fertility, or grown at a time when the soil was being 'rested'. Rice and wheat displaced roots, leafy food items and millets. The new generation hardly knows of any other food. Same crops were grown without resting periods or without intercropping, and as a result the soil fertility has declined rapidly. The problem is difficult to solve because dietary habits have changed, and it will take a long time (if ever) to show the new generation the advantages of growing diverse food items.

The initial problem of food shortage was a direct result of concentration on foodgrain production. Between 1950 and 1990 there was a doubling of the population in this region. An area that had already reached its peak production capacity now had to carry twice the burden of population. Per capita availability of resources declined despite the extension of cropping activities in marginal lands. There were no dramatic increases in productivity and thus food availability also declined.

One factor that contributed to making the food problem far worse than it should have been was the breakdown of traditional systems of maintaining, enhancing, sharing and conserving the resources. ICIMOD studies indicate that the extent of crop rotation, intercropping, number of crops and combinations, and other forms of diversifications have declined overtime. This has been a direct result of the change in attitudes of the populations, and their reluctance to adhere to social sanctions that had restricted them from overextraction, and their inability to conduct group action. The reason for these attitude changes is that the state intervened in the traditional structure and introduced its own version of how things ought to be run. Further, linkages with the market meant that profitability became such an overwhelming concern that farmers turned a blind eye to the fact that their resources were being depleted at an unprecedented rate.

For instance, by subsidising fertilisers, pesticides, large-scale irrigation projects, high-yielding seeds, the government made

the indigenous systems seem obsolete. Farmers saw the benefits from over-extraction. They sold more – even though most of what they sold to the government was undervalued – and earned more as a result. This strategy had two results, one was that farmers were now linked to markets that were not their own. They were producing what the plains wanted, and getting paid what the plains decided. This alienated the farmers from their resources. And there was no incentive by the government to encourage farmers to plough back into the land what they earned from it. Second, this strategy made the farmers more dependent on external inputs, and thus limited their production and

consumption options. Input-output ratios worsened (more chemical inputs for the same amount of output), and this exacerbated the extent of overextraction.

The other significant problem of this market-oriented approach is that it has created pockets of wealth. Areas that were well endowed and accessible benefited while others remained in relative isolation. As a farmer in the Jhiku Khola watershed in the middle mountains of Nepal explained, "we have benefited because we are linked so well with Kathmandu. But in the higher areas around our watershed, farmers have given up farming and find working for us more remunerative. We can employ them only for a few seasons

Appendix 1: Indigenous Farm Resource Management Techniques in Cold Deserts

Cold deserts epitomise the problems of the hill areas. They are harsh, remote and fragile. Farming communities use traditional wisdom to grow crops and regenerate their resource base in these areas. Some of the practices of farmers in Ladakh and HP are discussed here. This extract is based on an ICIMOD study 'Appropriate Farm Technologies for Cold and Dry Zones of the Hindukush – Himalayas'.

Ladakhi farmers have developed their own astrological system for solar observation which they use to make agro-meteorological forecasts, like snowfall, winds, storms, solar radiation and even pests.

Annual crop rotation makes optimum use of the local agro-climatic conditions. In Pattan Valley farmers grow two crops despite that fact that snow covers the fields till March or April (from November). This crop rotation is achieved by spreading soil over the snow in the fields which enables the farmers to catalyse snow melt. Thus land preparation can start as early as March and barley can be harvested in July followed by buckwheat which is harvested by September and kuth is sown prior to snowfall since a long period of stratification is essential for this seed. Kuth is harvested after mid-August. Crop rotation practices are based on what keeps soil fertility. Thus fields are divided into thirds and crops are rotated by seasons or on a yearly basis. The emphasis is on fertility, conservation of manure and decrease in any crop residues that are disease carrying.

Local germplasms of major crops in these areas are acclimatised to the harsh climate and the conservation of this germplasm receives high priority. The common practice is to collect seed from selected stands that are showing vigour, disease resistance and high productivity for the future. After every three or four years, the seed source is changed without diluting the seed criterion. This is a natural check against inbreeding and low productivity.

Monastic traditions are used to improve soil fertility. Soil that has been sanctified by the Lamas is used for barley cultivation. This is a simple and logical way of improving the porosity of soil that has been hardened by continuous barley cultivation. In this religious ceremony, fresh, sanctified soil is spread by the farmer before he grows the next barley crop. To ensure uniform distribution, 20-25 kgs of manure is unloaded after every seven steps of a woman.

Farming communities have developed different kinds of co-operative organisations to carry out routine farming operations. These organisations also help during calamities. In most villages, a village mate is annually selected from certain families and his special job is to make all kinds of community related announcements such as repairing of kuhls and water tanks, as well as any special event ceremonies. His salary is paid by the farmers.

Local groups share responsibilities as follows:

Group	Functions
Faspoon	7-8 families that look after indoor work in case of death
Langgsthay	Families that share bullocks
Ra-rays	Collective grazing
Beyas	Group of farmers who do collective grazing
Srang-Pa	Informer of a community

after which they must go back to their farms...their lands are tilled by their women, and they try and grow what little they can. It is usually not enough because with the money they earn here, they have to buy food. And food is now more expensive than ever."

A bird's eyeview of the same watershed reveals another interesting perspective. Jhikhu Khola is a fertile, well-endowed watershed. Its biophysical features are well suited for all kinds of crops. It is warm, has red soil, which is not hard and is easy to till. Yet, it is spotted with barren steppes, denuded lands, exhausted soils, and now has a severe water problem. The cause of this is the breakdown of social sanctions on common property resources. Overgrazing, deforestation, poor choice of trees for the forest (by the government and NGOs), and the extension of intensive agriculture on marginal lands have contributed to this situation.

A visit to the site where the grazing commons earlier existed reveals the extent of overgrazing and the destruction of the catchment area. There are efforts now by a few NGOs to create user groups (community groups, much like those that existed in the past) which will use the resources as common property and will thus restrict overgrazing and introduce stall feeding (feeding animals inside their shed rather than letting them roam freely. This limits grazing and keeps top-soil intact). ICIMOD officials, responsible for some of this rehabilitation work, claim that their efforts will take long to come to fruition. And the success of their efforts will almost solely rest on their ability to create user groups that are genuinely concerned and aware of the problems they face.

"Life is easier for the rich farmers because they can afford to pay for expensive fodder, but the poorer ones have had to sell their livestock because there are no pastures left. These are the people for whom food remains a perennial problem. This has been one of the biggest problems and is due to the strategy that overemphasises food and entitlements to food, without giving enough attention to where the food will come from in the long term," said one official. "In this watershed (Jhikhu Khola) farmers have had to cultivate on steep slopes where they know the degradation will be the fastest. They had no choice. The other slopes are now either taken or infertile."

To ensure food security in the HKH region, cash crop farming – which utilises the niche (Appendix 2) of mountain areas – has emerged as a viable option and one that is being promoted across the region.

The logic of this option is: farmers have been unable to secure for their households enough food simply by growing food-grains, which are not suited for the mountains in any case. Thus instead of food-grains, these farmers should be encouraged to grow high value cash crops which will increase incomes that will entitle them to enough food for the household. The logic is compelling and based on sound comparative advantage.

There have been many success stories; the most famous one is the story of apple farmers in Himachal Pradesh. And that story has served as a template for many agricultural transformations in the HKH region. K N Badhani of Garwhal University, Srinagar, in his paper 'Enterprise-Based Transformation of Hill Agriculture' discusses one such case, that of Garampani region in the state of Uttar Pradesh.

Garampani is a small town in the Nainital district of UP. It is situated in the lower Himalayas and is close to the hill stations

of Haldwani, Nainital, and Almora. In the last 10-15 years, there have been dramatic increases in the adoption of market-based high value vegetable cropping in this area. The results have also been very positive. Income and employment have increased by 170 per cent on an average, and this has increased farmers' entitlements. Although farmers have adopted cash crops, they have not completely abandoned conventional crops because of several reasons (land quality, labour shortage) among which is included the fear of shortage of food. This has meant that cash crops still account for only 63 per cent of total area under cultivation. The local market for vegetables developed spontaneously and without external influences. Vegetable farming has decreased the migration of youth to cities. High labour requirements and increased incomes have made the gender distribution of workloads more equitable. Women, traditionally restricted to sowing and reaping, now do marketing and selling.

Appendix 2: Niche

Due to their specific bio-physical attributes, for certain activities, mountain areas have some comparative advantages over the plains. Mountains act as a source of important high value added products like medicinal plants, fruits, flowers, vegetables, or are source for hydro-electric power. To increase food security, these niches have to be harnessed in a way that they benefit the local population. Accessibility and availability of exchange options are critical for successful harnessing of a niche.

For instance, mountain areas grow off-season vegetables (vegetables that cannot be grown in the plains during the summer) and these are sold in neighbouring towns. There are quite a few success stories of mountain areas that have profited from growing off-season vegetables. The common theme that links these success stories is accessibility of these areas to their final markets. It is this linkage that has made Jhiku Khola area so profitable. The road journey from Kathmandu to this area is less than an hour and this means that farmers can even take day trips to sell their vegetables in the city and return with enough for the daily meal. On the way out of Kathmandu (on the road leading to the airport) one can see farmers selling vegetables from small bundles that they have brought in early in the morning. They have to finish their stock before they return and thus they do brisk business in the evenings.

Another possible reason why these farmers might like to do their own marketing is because of the unfavourable terms of trade they get from middlemen. And this is the problem that many areas, not well connected with their final markets, face. They have to depend on the vegetable trader who usually gives them rates sometimes as low as 20 per cent of the final selling price. Neither the government nor the farmers have been able to organise themselves to improve the terms of trade between the hills and the plains.

Jodha narrates an interesting story that illustrates this point. A group of monks from the district of Leh who heard about the hugely profitable vegetable market in Delhi, decided to risk all their savings on a make or break vegetable marketing trip to Delhi. They hired a truck, packed it with all their fresh vegetables and set out for Delhi. Delhi turned out to be much further than they had imagined. By the time they reached most of the vegetables had perished. They did not know where to sell the produce or how to contact a middleman. They didn't even have a place to stay and eventually found refuge in a monastery. Two days later all they had left with them were turnips. And turnips don't sell in Delhi. Eventually they had to beg for money and returned in the same truck with nothing to show for their investment of Rs 20,000.

In conclusion, niche harnessing can benefit the mountain areas because it can increase entitlements and thus improve access to food. However, without infrastructural support, niche harnessing is not only ineffective, it can be harmful because it requires higher investment, greater input, and makes the farmer dependent on exchange options. It also contributes to a break-down of traditional methods used to secure food and conserve resources.

The negative consequences of cash crop farming have been primarily related to environmental degradation. The foremost is the decline in availability of fodder, an important by-product of conventional crops. As a result the dependency on forest fodder has increased sharply. This has led to overgrazing and depletion of the catchment area. The amount of cattle has declined and so has the availability of organic manure and milk. This has raised some important questions about the sustainability of high value cash crop farming.

The single largest problem has been the shortage of water. And this indicator of unsustainability has been widely reported in the Jhiku Khola watershed also. Drying up of water resources has meant that risks associated with cash crop farming have increased significantly, while returns have not been able to keep pace. Farmers of the Jhiku Khola watershed have learnt their lesson albeit a bit too late. With the help of some NGOs these farmers have built a tank to collect rain water. The tank was completed in late 1998 to collect the rain from the first winter shower. But the rains never came, and until the writing of this article (April 1999) there has been no rain in that area.

The decline in traditional water harvesting techniques has worsened the problem. Traditional practices, based on a high degree of co-operation and responsibility, were effective and equitable. For instance, 'kuhls' (water channels) that diverted water right from the glacial head to a village, at times travelling over 10 kilometres, were jointly owned by the original founders and their descendants who distributed water freely, and in time of shortages, according to the effort put in by various farms who maintained the kuhl. This ensured commitment because each farmer had a stake in the efficient running of the kuhl. Kuhl managers were appointed to work on behalf of the community.

Traditional wisdom about the species of trees that helped water harvesting versus the ones that were harmful for it, is fast disappearing. Balaram Thapa, in his doctoral thesis on trees planting and attributes, has shown that farmers have a very thorough knowledge of the trees that are good and the ones that are bad for water harvesting. According to him, the government, due to their ignorance, has paid no attention to this knowledge and has made special efforts to promote trees that are detrimental to water conservation and erosion. For instance the government has distributed and planted seedlings of trees that have a high growth rate, survival rate and generate bio-mass. While the farmers

want trees with small leaf size (that decompose easily) and trees that have leaves at inclination that reduces 'tapkan' (water falling off a leaf) which reduces erosion. Farmers have classified trees according to density of leaves, tree height, inclination and root size and shade effects. Yet this knowledge is wasted and thus catchment areas now lie dry and eroded. And 'resilient' but useless (farmers call them 'rukho') trees are peppered all over the landscape.

R K Shrestha of the Love Green Foundation, an NGO that promotes planting of trees for forest, fodder and fruits, says that along with water, it is the high use of insecticide and pesticide that has become the bane of the farmers. Crop diseases have increased dramatically and yields have dropped significantly. Pesticide use has killed bees (including honey bees) that improve pollination. The quality of vegetables being taken to the nearby markets is suspect because it contains dangerous amounts of chemicals. No one cares as long as the money is being made, which it is. Farm area of 0.5 hectares, doing high value agriculture, can yield as much as Rs 4,00,000 in three to four months.

Farmers in Jhiku Khola watershed have earned a lot of money, yet most of it has been used to buy land in the neighbouring cities or invested in gold. There are no signs that any money is being reinvested in the land.

An official at the local ICIMOD office said that distribution of free seeds, subsidies on fertilisers and pesticides is not ideal because it does not give the farmer a fair idea of the input prices that are going into his land. Realistic input prices (seed, fertiliser, pesticide, electricity) would make the farmer space his planting cycle and look for alternative measures to increase soil fertility and reduce crop diseases. And with the income the farmer is earning, he can well afford to give his soil some rest.

This substantial increase in income has changed lifestyles and decreased migration. Although in Jhiku Khola watershed, the drudgery for women has not reduced. They still do most of the work on the farm, while the men concentrate on the marketing. Diets have changed dramatically and the focus is on proteins, meats, packaged food and alcohol. Most farms boast of a few motorcycles and conspicuous consumption has increased dramatically. Children are being educated at boarding schools and the parents hope that they will find better jobs in the cities. One farmer said, "farming is getting tougher, we are hoping that with our land in the city, and our son employed, we too can enjoy the urban facilities".

Focus on high value added niche crops has not helped food security for the poorer villages that are either not connected to main cities through a highway, or have poor biophysical features. These areas have to depend on non-farm income, which means migration to the cities or to areas where cash crop farmers need cheap labour. To add to their problems, the poorer farmers of the same watershed now have no grazing commons or limited access to water.

Jodha says that any solution to this crisis needs aware and co-operative politicians. Firstly, districts should be divided according to watersheds, which share common biophysical features. District authority should be decentralised and farmers must have a say in how much money is being spent on what in each watershed. This transparency will improve co-operation and remove farmers' fears that benefits are unequally divided. Most importantly, any successful strategy needs a politician who has the benefits of the mountains as his priority. "It's the difference between someone like Parmar (ex-chief minister of Himachal Pradesh) and someone like Pant (powerful politician from UP Hills). Parmar knew how to exploit the niche of the hills and made every effort to improve prosperity in his region. Power at the centre held no charm for him. Years before NGOs introduced training for farmers in the hills, Parmar sent his men around the world to learn new farming techniques. Pant, like most other UP politicians, was concerned more about consolidation of power at the centre. UP mattered only for elections, his real interest was politics in Delhi. The UP Himalayas, thus, never saw the kind of development that was seen in Himachal."

In conclusion, the strategy of increasing entitlements to food, and thus improve food security in the HKH region, has overlooked the impact on the environment. This has happened because this strategy has not attempted to learn from traditional wisdom and has contributed to the break down of all forms of co-operation that would have ensured sustainability. The government has – either through indifference or through ill-informed policy – made matters far worse. A new form of food insecurity now threatens the lives of the farmers of this region – the threat of depletion of key resources like water, fodder, and soil. Increasing entitlements (incomes) might have brought prosperity, but the steam is running out of this strategy. Entitlements are secure only as long as endowments (key resources) have it in them to carry on producing at the current rate. Now it seems they aren't.

Microfoundations, At Last

Jayendra Nayak

India Development Report 1999-2000 edited by Kirit S Parikh; published for Indira Gandhi Institute of Development Research by Oxford University Press, Delhi, 1999; pp 300, Rs 345.

IT was Hugo Sonnenschein who said that there were two kinds of economics, micro-economics and fairy tales. For governments long used to believing that growth and development are largely reflective of aggregate processes and consequently best analysed in terms of macro-economic variables and modes of reasoning, the currency and banking crises in several countries during the 1990s are a cautionary tale that the micro-economics of financial markets can sometimes turn up unexpected pathologies. While most official reports are yet to recognise that this might alter the economic analysis of the development process, the latest *India Development Report* devotes some considerable space to analysing the microfoundations of macro-economic policy and change. This is unconventional terrain, even for many professional economists. For the larger readership which the Report very evidently seeks to draw in, it lays out with considerable clarity the interpretative content of such micro-economic analyses.

About a third of the Report dwells on India's recent economic history, including the state of its public finances and a characterisation of how feeble our record has been on environmental quality, poverty alleviation and social security. Another third constitutes sector studies: in urban transport, energy-power, coal, oil and gas, and primary education. However, it is really in the last one-third of the report that microfoundations issues get raised. I shall cherry-pick five problems from this part of the Report and ask whether the investigative logic used and the interpretations provided are adequately robust.

The first problem is privatisation and auctions. P G Babu and Nivedita Das provide an exploratory account of our recent history of telecom privatisation and ask whether the theory of auctions can provide clues to whether the particular auction model adopted had a serious design flaw in it. In one sense this uses micro-economics at its rigorous best, for markets for auctions can be formally modelled and

the manner in which auction bidding is structured can very sensitively and decisively affect outcomes. Both the efficiency of the bidding process and the expected revenues earned by the auctioneer are contingent on the design of the auction. In another sense, however, it is helpful to recognise that there continues to be a wide gap between solutions to formal game-theoretic models of auction design and the more intuitive results which practitioners who either control or participate in auction bidding appear to believe in. This may be critical for auctions because, while all economic models are necessarily abstractions of a clumsy behavioural world, auction models have shown a striking tendency for answers to change as enrichments to their realism are introduced.

Here is an example: In many auction models, the expected revenues to the auctioneer increase with the number of bidders. Enrich the model by having bidders participate only when they make a prior calculation comparing the probability of winning with the cost of bidding. Auction models then yield the result that beyond a point an increase in the number of bidders could decrease expected revenues. There is thus an optimal number of bidders for expected revenue maximisation. This insight is, however, familiar to investment bankers who handle strategic sales as a mode of privatisation and advise governments on such sales. Strategic sales proceed in two stages. First the auctioneer seeks expressions of interest from possible bidders and then shortlists participants for bidding. In its popular description, the shortlisting is meant to weed out bidders who are 'inadequately serious'. A little reflection will reveal that shortlisting does more. It should only retain those bidders who believe that their probability of winning is high enough to justify their bids, and if all shortlisted bidders believe this the expected revenues will rise.

Notwithstanding some of these limitations in the use of formal auction models,

governments' reliance on these models has been expanding. The US government has used multiple round auctions to allocate radio spectrum rights, and the debate on whether uniform price or discriminatory auctions should be used to place government securities is long familiar to central banks. Game theorists who design auctions with specified outcomes are clearly in demand, and a government which would like markets to develop for the allocation of resource rights or for the privatisation of state-owned enterprises could avoid the several pitfalls which auctions contain by examining auction designs more critically.

A second problem arises in the analysis of risk, particularly in financial markets and in financial institutions. Micro-economics has chiselled and achieved considerable clarity in recent years in the understanding, categorisation and measurement of risk. Susan Thomas and Ajay Shah ask how we can apply this to Indian markets, not least for the management of risk. Their argument is extremely well laid out. When one is looking at the risk of a portfolio of debt assets, whether of a bank or of a mutual fund, risk is not additive over asset classes or individual investments. This needs to be specially emphasised as the entire regulatory logic of capital adequacy for banks, originating from the Basle norms a decade back and adopted by RBI, assumes that risk is additive, and banks (including in India) calibrate portfolio risk in a linearly additive way. Thomas and Shah emphasise that the analytically rigorous way to compute portfolio risk is to use Value at Risk (VaR), though they recognise that in illiquid markets forecasting asset price volatility, an essential ingredient in the calculation of VaR, can be hazardous. A bank can properly judge whether its capital base is adequate, however, only after it has computed its VaR.

This is conceptually elegant, but not without its problems. Besides the difficulties involved in computing asset prices for bank loans in illiquid markets when credit defaults loom on the horizon, there is a more fundamental difficulty on the adoption of such an approach to risk. This is a finance theory centred approach to risk and encompasses very well certain kinds of risk such as market risk, liquidity risk and credit risk (though their decomposition can sometimes prove empirically intractable). Economists who are more

used to distinguishing between state of nature uncertainty (which is modelled stochastically) and strategic interdependence uncertainty (characterised game-theoretically) could well ask how useful VaR would be for the latter. All asymmetric information situations, including principal-agent problems, are game-theoretic problems, and two representations of this, moral hazard and adverse selection, are now customarily seen as maladies intrinsic to financial markets. It is unclear that strategic interdependence uncertainty is best comprehended using VaR, and when we look at risk in financial markets the risk arising out of situations of strategic interdependence is high. East Asia in the last two years is manifest evidence of this.

This is particularly relevant when one is rethinking prudential regulation, a third area in which microfoundations are crucial. In another chapter Shah and Thomas emphasise the pervasive ability of economic agents to change their behaviour in the light of changes in a regulatory regime. This principal-agent characterisation, and the regulatory desire to strongly shape the behaviour of market participants, has encouraged the emergence of a visibly layered regulatory law in the capital markets. A complementary approach would be to facilitate the emergence of changes in market microstructure which lead more readily to regulatory objectives being achieved. Shah and Thomas argue illustratively that the clearing corporation of a stock exchange is a superb example of an institutional innovation which facilitates the regulatory objective of market robustness by avoiding payments crises on the stock markets. Their argument can be extended to demonstrate how the emergence of a suitable market microstructure can strengthen regulation. If the clearing corporation is to take the counterparty risk in all trades with brokers on a stock exchange, it emerges as the best institution to credit-rate brokers. But this skill should be leveraged to find other applications. Thus, banks are very cautious about lending to brokers as they do not possess the information and expertise to assess broker creditworthiness. As the clearing corporation increasingly does, it can use its risk assessment skills to open a sustainable channel of bank credit to brokers by providing credit enhancement to banks in the form of guarantees or other forms of comfort. The clearing corporation of the National Stock Exchange has already

decided to act as a designated intermediary in stock lending to brokers. These examples illustrate that regulation is sometimes more effective if it facilitates the emergence of market processes and institutions which enable market participants to better manage the risks of their transactions. This insight, Shah and Thomas emphasise, is fundamentally micro-economic.

Subir Gokarn's chapter on the east Asian financial crisis and its implications for India raises a fourth issue which requires clear microfoundations. He argues that the financial system in these countries was undersupervised precisely because the export promotion regime completely subordinated it, and the profitability of exports provided a reasonably reliable monitoring mechanism for the allocation of credit. As exports fell, this automatic supervisory mechanism for banks, anchored on the export promotion strategy, began to erode, and the absence of a more formal supervisory system led to financial meltdown. Gokarn suggests that these were the structural reasons for what is best seen as a banking crisis in east Asia. The proximate reasons include the build up in short-term debt, much of it from overseas and unhedged, the large investments by banks in asset markets, and perceptions by overseas investors of implicit guarantees by governments.

Situating the inadequate supervision of banks within the comfort arising from earlier export successes may be more associative than causal, but still does not provide an altogether credible explanation for why sudden changes in investor sentiment occur at a speed and an intensity which lead to financial turmoil and crisis. In financial crises, sentiment reversals lead to panic, and explanations based on the fundamentals of the real economy seem at the time to be much too remotely related to the discontinuous changes in expectations which characterise the destruction of financial markets. The synthesis today of sentiment-centred explanations of financial crises rests in what are known as multiple equilibria models, associated particularly with the work of Diamond and Dybvig. These models are self-fulfilling, in that changes in expectations lead to shifting equilibria, and have acquired a new-found interest among economic theorists in explanations of certain kinds of financial crises. They are game-theoretic models embodying rational economic behaviour, and crisis outcomes represent non-cooperative Nash equilibria. While

the microfoundations of such crises are indeed legitimately representable in terms of the increasing precariousness of firms and domestic banks, as in Gokarn's analysis, this appears incomplete if the dynamics of financial markets are ignored.

A final microfoundations issue is raised by A Ganesh-Kumar, Kunal Sen and Rajendra R Vaidya in their discussion of India's export competitiveness and finance. In analysing impediments to firms gaining in export competitiveness they note that there are good reasons in economic theory for outside finance raised by exporting firms to be more expensive than internal finance (retained profits and depreciation). This is so because of asymmetric information between a firm and its creditors, as also between the firm's management and its shareholders, resulting in raising the cost of outside debt and imposing an equity price premium. One of the problems they study is whether exporters are disadvantaged compared to firms producing for domestic consumption in the additional costs they incur for raising outside finance.

Their empirical work during the period 1989-97 comes to the following conclusions: Firms producing for domestic consumption have higher profitability ratios, but exporting firms have faster asset growth and larger asset sizes on average. Although exporting firms have been able during this period to raise larger outside finance than have firms producing for domestic consumption, they have relied more substantially on borrowings. Most strikingly, the proportion of outside funds raised through the capital markets has been higher for exporting firms, leading to the conclusion that exporters face a smaller difference between external and inside finance costs. Ganesh-Kumar, Sen and Vaidya infer that this could be because financiers use successful exports as signalling the strength of firms. While more empirical work is needed to support such a conclusion (particularly as exporting firms in the sample have lower profitability ratios) this focus on the microfoundations of export competitiveness is valuable.

If the latest *India Development Report* is to be set off against the first Report two years ago, it is the newly found focus on micro-economic themes that is its most visible distinguishing feature. Future Reports are promised every two years, which is disappointing and indicative perhaps of how slowly the economy is expected to change. One trusts that the focus on microfoundations will not erode.

State Formation and Subalterns

Walter Fernandes

Subalterns and Sovereigns: An Anthropological History of Bastar 1854-1996 by Nandini Sundar; Oxford University Press, 1997; pp xxiv+296, Rs 495.

SOME romanticise the tribal history of British India as one of perpetual resistance to colonialism and others present their communities as powerless and passive. The former is used to co-opt them into the 'mainstream' freedom struggle forgetting that they also resisted their Indian exploiters. The latter legitimises their exploitation by presenting them as easy-going people who have to be 'developed' and 'uplifted' by outsiders.

Nandini Sundar began with the assumption of a community in revolt. To understand it she went back to their oral history. To her consternation the Dhurwa tribals of South Bastar did not have many such memories, not even of Gunda Dhur, presented by the mainstream history of the freedom movement as the leader of the 1910 revolt. Then she stumbled upon the movement led by B D Sharma against the proposed steel plant at Maolibhata. In trying to understand their 'heroic resistance' she rebuilds the history of state formation in South Bastar and its impact on the tribals.

The book begins with a discussion on the manner of founding the village. Its oral history differs according to the need of the hearer or the storytellers' desire to show their superior status. Sifting through it Sundar identifies social relations, resistance, acquiescence and state formation, and their links with their economy. For example, the 'perna', the priest and the 'majhi' the temporal head, were chosen based on their success in hunting and agriculture. Also the status of the lineage is linked to land and forests, so are marriage, accumulation of wealth and bride price. The founding villagers gave land to newcomers and "taught them to live and cultivate" (p 33). So they were viewed as civilising agents having power over the late comers and over land. There were, however, hidden conflicts in this apparently static arrangement.

Forests are critical in defining their life. Given their total dependence on it, the Dhurwas perceived them as the abode of their spirits, not merely as a material resource. They are also linked to shifting cultivation. The tribals depended more on millets that could grow in the forest than on rice that required open spaces. Land-ownership not being bound by rigid revenue laws, was mobile. So their food habits

as well as agriculture have changed over time and space. Their history too is not static. Even before British arrival, contact with outsiders existed through the market. They also participated in regional power struggles. The Kakatiya dynasty of Warangal defeated their Naga kings and ruled Bastar till 1947. They came under attack constantly and kept changing their capital. The defeated Nagavanshis retained some importance. In the 18th century the Marathas integrated Bastar into Chhattisgarh.

These developments also involved various stages of legitimisation of state formation. A weak central authority was one way of integrating the tribals into the Kakatiya kingdom. 'Dusserah' did it on the ritual plane. Brahminic in nature, it also involved the masses in its preparation and celebration. 'Corvee, known as 'begar' was linked to their economy as well as dusserah. Thus it symbolised people's integration as well as the king's power by bringing the notables and the common people together. By combining it with local 'jatras', dusserah created a state legitimising cosmogeny moving upwards from the village. Danteshwari, the Kakatiya goddess provided the second level of legitimacy. Like that of the king, her position as the chief goddess had to be reinforced every dusserah. Legitimacy was conferred also by providing seniority to Mawli, the goddess of the defeated Nageswari kingdom.

Thus the coming of the British to Bastar was a "part of the composite development of events". Legitimacy notwithstanding, state formation was not always peaceful. There have been many rebellions, the one of 1876 being the first under the British caused by the 'malguzari' settlement and palace intrigues. To save himself, the king approached the British, thus providing further legitimacy to colonial rule. He too retained his legitimacy by blaming his officials for maladministration. The colonial context of the revolt was ignored. So the British continued their indirect rule. Treaties, exchange of gifts and rituals ensured the king's subjugation as well as internal autonomy. A land revenue system with a fixed amount under malguzari replaced 'khalsa' and zamindari'. The 'ryots' complained also about heavy punishment under the penal code, that too

a British introduction.

The British introduced direct rule at Bhamdeo's death in 1891 which lasted till 1908. It increased administrative expenses. The forest policy became a living symbol of state formation. Precolonial forest management cannot be romanticised, but it was sustainable. Later, practices were standardised but revenue remained its first concern and uncontrolled timber felling destroyed forests. But the British blamed shifting cultivation. Their policy ranged from a total ban to creating reserves for it, but rarely resulted in repression. Non-timber forest produce was the next source of conflict. Merchants had cheated the tribals earlier. But 'scientific management' meant more control, even ban or taxes. 'Nistar' rights were introduced, forests and lands classified, grazing dues and other changes introduced. Reserve forests involved greater imperial control and relocation of several villages. Thus forests came to symbolise the competition between the state and the local users. "The former emphasised large logs and the latter poles" (p 108). These changes also worsened the famine problem. This section is well written. But one is surprised that the writer who begins by giving importance to oral history, depends almost totally on written sources to understand land and forest that are the very centre of tribal life.

The rebellion ('bhumikal') of 1910 is situated in this context of "pitting of indigenous law against colonial law" (p 133). The caste-class background of oral and written histories is well analysed. The condescending attitude of the brahmin, the British and the local ruler and the repression that followed are brought out, so also the possible dual role of the Methodist missionary William Ward. Sundar concludes that it was an anti-British uprising though co-opted by disgruntled elements within the palace. Unlike in 1876 the tribals did not fall at the feet of the British. At least a few Englishmen seem to have realised that it was against the foreigner. So unlike in 1876 when they justified the rebellion, they attributed 1910 to the money-minded urban leaders and dismissed the tribals as superstitious. In this context, the discussion on whether Gunda Dhur is an individual or an inspiration makes sense. So does the conclusion that the spirit of the rebellion continues.

Also the chapter on the tribal question 1927-50 becomes meaningful. It begins with a discussion on the role and views of anthropologists. British anthropologists wanted to protect the tribals from the Indian 'mainstream' while Indians wanted their

integration. Despite these differences, many of them had a deep awareness of the issues and some even understood the government as the main problem. But their solution was more state intervention, preferably British. Besides, in focusing on the tribals, 'dalits' who had contributed much to life in the region came to be excluded. Also excluded was tribal self-rule because of their inability "to handle representative institutions" (p 163). So the king was retained but the British ruled through tribal headmen. They codified their customs, gave them some penal powers and turned the 'pargana' into an appellate body. In thus reducing the cost to the administration, they forgot that custom did not exist as a static body. So the devolution imposed from above failed but turned the 'majhis' who had organised the two rebellions, into cogs in the British wheel. Protection of the tribals was partial and exploitation continued.

Post-independence debate too was on the lines of integration versus isolation. Nehru opted for the middle path of controlled integration. But most post-independence governments have accepted Ghurye's assimilationist position. The nationalists interpreted anything that threw doubts on India as a nation as colonial divide and rule. The author brings out their racist overtones through the constituent assembly debates on the fifth and sixth schedules. The tribals "being inferior" were "incapable of ruling themselves" and if given autonomy, those in the north-east would secede.

Officials too betray this attitude. The British refusal to recognise Rudra Pralap's daughter as queen till the tribals forced them into it, people's suspicion that her death in London at 26 was unnatural, the manner in which the post-independence government declared her son Pravir insane, are its indicators. So the attack on their livelihood and the patronising attitude of the welfare officials, instead of strengthening the legitimacy of the state, add to their exploitation. Instead of recognising their weak agricultural base the state tried to co-opt the process of Pravir becoming a 'people's king'. In the resistance that Pravir led, his personal and people's grievances merged into one. He was arrested and de-recognised. Riots followed. Dusserah continued to remain a political symbol in the dispute.

In this conflict the author situates the 1965-66 famine, mobilisation against paddy levy, Pravir's role, the siege of the palace and his death in police firing on March 25, 1966. Women's role in the mobilisation is highlighted. This is, an

excellent example of history from a people's perspective. The official and local versions are compared and the evolution of myth and reality studied. It substantiates the author's starting point that while one cannot accept the myths of ongoing resistance or passivity, resistance exists in different forms. In 1966 the government exaggerated the extent of resistance to legitimise their oppression while the tribals did the same to de-legitimise the state. Ultimately the struggle led to their disempowerment because it turned into a palace power conflict. The deterioration of dusserah is contrasted with Pravir's popularity.

Then came Baba Bihari Das, perceived as Pravir's reincarnation. The merchants used him to exploit the tribals. Administrative efforts to control it were undermined by political intervention in Baba's favour. Hence, the concluding chapter on the uncertain future of the tribals. They resist when their livelihood is threatened. The specific contribution of Sundar is not in giving a functionalist interpretation of how and why people revolt at a given time,

but in analysing the role of "popular memory in fuelling resistance" (p 249). Its nature and the continuity between 1876, 1910 and 1966 are well analysed. The state that wants to remember 1910 as freedom movement considers 1966 anti-national, thus showing the link between state formation, resistance and popular memory. The discourse on development makes interesting reading. So does the section on insiders and outsiders and state intervention around tribal self-rule and the sixth schedule.

Precisely because of her rich analysis based on popular memory, one is disappointed at her failure to go back to it while discussing land and forests, and at her failure to mention Maolibhata in the discussion on development and revolt. It is mentioned right in the beginning and forgotten. This shortcoming notwithstanding, Sundar's is an immensely readable book, data based, well analysed, with quaint humour mixed with uninhibited use of words. An excellent contribution to literature on state formation and the subalterns.

CENTRE FOR STUDIES IN SOCIAL SCIENCES CALCUTTA

CULTURAL STUDIES WORKSHOP

The Centre for Studies in Social Sciences, Calcutta, will be holding the fifth All India Cultural Studies Workshop from **February 24-28, 2000**. The venue for the workshop will be Bharatpur in Rajasthan. The broad theme of the workshop will be **Critiques of Culture**, where the intention will be to explore the interlinked notions of 'culture', 'critique' and 'modernity' in Western theory and their deployment in the Indian context. With a focus on modern India, the workshop hopes to address the theme of cultural critique around issues such as (i) the cultural politics of nationalism, (ii) colonial and post-colonial cultural identities, (iii) the changing frontiers of disciplines, (iv) aesthetic productions and transgressions, or (iv) globalisation and the reinvention of cultures.

The workshop is intended to give young researchers the opportunity to share their work with a selection of senior scholars, including some of the faculty of the CSSSC. It is aimed for doctoral or post-doctoral students (preferably under the age of 35) who will be able to present a research paper for discussion. The CSSSC will bear the expenses of rail travel and accommodation in Bharatpur for all selected participants. Those wishing to participate in the workshop may apply with their current c.v. and a brief description of their current research. Applications are to be sent to the Registrar, Centre for Studies in Social Sciences, Calcutta-700 029, by **November 15, 1999**.

Finance Commissions: Perilous Proxies and Dangerous Dummies

S M Vidwans

Finance Commissions have progressively let sophisticated mathematical and statistical methods determine their recommendations. This approach was not free of deficiencies of varying kind and seriousness, but worse, it brought in its wake two elements inimical to the participative process of revenue sharing: obscurity, bordering on opacity, of the rationale of recommendations, and lack of accountability for their deficiencies. This critical review of past Commissions' work attempts to remind the new Commission of this reality and alert the state governments to it.

I Introduction

THE object of this paper is to highlight certain issues that stem from the increasing sophistication and complexity of the quantitative methods employed by the Finance Commissions (FCs). Such methods were mainly used in the statewide distribution of taxes shared between the union and the states, especially of the union excise duties, but later, also in the other areas of an FC's work. The paper reviews and critically examines some of these methods. However, the author wishes to clarify at the outset that he makes no claim to originality in his findings given here. Consistent with its theme, the paper is kept free, as far as is possible, from mathematical or statistical derivations in support of statements made in it as their proofs are easy to establish. Further, only the results of the necessary calculations have been quoted as they can be verified from the indicated data from FCs' reports. A few subtle statistical points have been relegated to the notes.

BACKGROUND

The FCs used different criteria for different taxes and also fixed the percentages of divisible pool to be distributed by different criteria when more than one was used for the same tax. The specification of these percentages was a decisive factor by which the FCs could shape the resulting pattern of the statewide distribution. For the taxes to be shared with the states or assignable to them, the criteria were simple, such as population, or collection or assessment of a tax, or the amount of tax revenue foregone, or certain measures such as passenger-kilometres. The statewide distribution of shareable proceeds of a tax will be necessarily an arithmetical exercise. But, because of the simplicity of these

criteria, their direct relevance to the tax, and the simple arithmetic of the statewide distribution, the FCs' procedures supporting their recommendations were easily understandable.

For union excise duties the position was, however, different. The sharing by the states in the net proceeds of these duties is only permissive. In their case it was not even implicitly necessary that the criteria used for statewide distribution should have some relationship with the factors of collection, assessment, base or incidence of these duties. Other factors could be considered in addition to or in total substitution of them. It was in this distribution that the FCs gave increasing weightage to relative backwardness of states, and it was this field, as the following review will show, that became a fertile ground for the growing sophistication of the mathematical and statistical methods used.

II Review

I TO VI FCs

Only the I FC used solely the population criterion for the distribution of the divisible pool of excise duties. All other FCs used one or more additional criteria for the distribution. For want of data on consumption, the II FC distributed 90 per cent of the divisible pool by population and 10 per cent by 'adjustment' to scale down the share for the more urbanised states which got greater advantage because of their large population. The III FC took into account states' relative backwardness in various respects, but, without quantifying it, the FC pronounced its recommendation as a well-considered judgment that "...the net proceeds of the union excise duties ... be paid out of the Consolidated Fund of India to the states and distributed

among them as below"[1] and specified the statewide percentage shares.

The IV FC distributed 80 per cent of the divisible pool by population and 20 per cent by some seven criteria of relative development (or backwardness) without spelling out how it combined the seven criteria for the distribution of the latter part[2]. A distinct trend was set by the V FC which appears to have used a composite index of development to distribute 20 per cent of the divisible pool by the backwardness criterion. It recommended that two-thirds of this part should be distributed to states with per capita (p c) state domestic product (SDP) below the average in proportion to the distance of their p c SDP from that average, and one-third by an integrated index of backwardness based on six development indices. It also did not clarify its procedure although it criticised its predecessor on the same count[3].

The VI FC ushered in the era of mathematical methodology for an FC's recommendation on the interstate distribution of the divisible pool. It employed a clear mathematical formula, the distance formula (DF), for distribution of 25 per cent of the divisible pool by the criterion of backwardness. The distance meant the difference of a state's p c SDP from the maximum p c SDP among the states. The state's share was made proportional to its size defined as the mathematical product of its distance and its population[4]. The unit of size is rupee, and it represents the SDP gap of the state, that is, the amount by which a state's SDP should be increased to make its p c SDP equal the maximum p c SDP among states. The assumption here is that the SDP gap has economic relevance to the distribution of the divisible pool. The DF will be discussed in detail later. It is important to note at this stage that because of its linearity the p c share

for a state, whose p/c SDP is the same as the mean p/c SDP, is equal to the mean p/c share (as one should expect). Second, it yields a p/c share that decreases as the p/c SDP increases, and does so at an increasing relative rate (elasticity). It is thus not merely a progressive formula but one with progressivity that increases with p/c SDP. It was, therefore, retained by the subsequent FC's, given disproportionate importance, and taken as a standard – unfairly, as we shall see – for comparison of progressivity of other progressive formulae.

VII FINANCE COMMISSION

The VII FC produced the first surge in the use of statistical methods and analysis for an elaborate scheme of the statewide distribution of the divisible pool of excise duties. Besides population (25 per cent weight) it introduced three progressive formulae using the following three statistics: (a) The inverse (reciprocal) of p/c SDP, (b) the percentage of poor in the state, and (c) a measure the FC worked out by its Revenue Equalisation Formula (REF). In each case it worked out the size of the state, which was the mathematical product of population and the statistic, and distributed 25 percent of the divisible pool in proportion to it [5]. All the three methods suffered from deficiencies of varying kind and seriousness. The substantive meaning of the first was obscure; the methodology of the second contained an elementary but vital mistake, and the third failed in its purpose.

The FC did not explain the economic or any other substantive meaning of the inverse income formula (IIF) which is progressive as it makes the p/c share of a state a decreasing function of p/c SDP. But when the inverse is multiplied by population, the size becomes a curious quantity: the square of population divided by an amount in rupees! Actually, it achieved the simple arithmetical result that if a state's p/c SDP was k times that of another state, the p/c share of the latter was k times that of the former (This creates a minor problem though See Note 1.) Another contrived meaning was forced on it by the VIII FC. But the VII FC, which introduced the IIF, did not spell out either of the two.

The second formula used the statewide estimates of poor population, separately for rural and urban areas, worked out by Raj Krishna, a member of the FC. The crucial requirement for this was the determination of state-specific poverty lines for the two types of area. At this stage of calculation Raj Krishna tripped himself.

For the estimation of the state-specific rural poverty lines, he used the results of a private research worker and created a serious policy issue. Second, because no such research was available for the urban poverty lines, he used the statewide (working class) consumer price index numbers themselves as if they measured inter-place price differentials [6]. This was an elementary but serious mistake, almost a blunder, making the recommendation of the VII FC void. Surprisingly, it was not noticed by any Commission member.

The FC considered it more relevant to deal with the p/c revenue potential of states than their p/c state revenue. It took the values of the potential to be equal to the estimated values of the p/c revenue by regressing it on p/c SDP thinking wrongly that by this method it equalised the revenue raising potential of a state by adjusting it for its p/c SDP. In fact, since this procedure made the differences among statewide potential directly proportional to the differences in their p/c SDP, its distance formula based on it, which the FC called REF, degenerated into the p/c SDP-based distance formula of the VI FC. None of the FC's members realised this obvious futility of its statistical exercise.

The Planning Commission experts also did not detect Raj Krishna's error. In the beginning of 1979, the Commission, of which Raj Krishna was a member, proposed to use the poverty percentages worked out by him and the VII FC's formula for interstate distribution of block plan assistance. It was at this stage that the government of Maharashtra (GOM) detected Raj Krishna's error which was pointed out by the chief minister of Maharashtra in his speech before the National Development Council (January 20-21, 1979). The Planning Commission then dropped its proposal. The CM also brought to the attention of the Commission the issue arising out of the use of private research by the VII FC without giving an opportunity to the states to examine it. A little later V M Dandekar published a paper dealing with Raj Krishna's error, the limitations of data and estimates of poverty percentages, the character of research papers on the subject, and the inherent dangers of using them in matters of operational decisions of the government [7]. (Raj Krishna never accepted his mistake nor responded to the criticism of his work.)

VIII FINANCE COMMISSION

The work of the VIII FC marked the end of the surge in the use of statistical methodology produced by its predecessor.

It also signalled the end of statistical input by an FC's own members and the entry of external consultants in its work. In the memorandum submitted to it the GOM brought to its notice the above three deficiencies of the VII FC's work. The response of the VIII FC was interesting [8]. It retained the inverse-income-formula (IIF) artificially interpreting it as giving a measure of income-adjusted total population (IATP) and noting that the state governments had not generally objected to it (see Note 2). But it did not say a word about the GOM's reference to Raj Krishna's elementary mistake which invalidated the VII FC's corresponding recommendation. Perhaps, it was indelicate to do so. It rejected the poverty criterion for several other reasons: unsatisfactory estimates, the questionable relevance of the criterion, the dependence of the poverty estimates on the concept of poverty, and doubtful reliability of data and methodology. Apparently, one FC can have good reasons for suggesting a criterion, and another equally good reasons for rejecting it.

The FC duly acknowledged GOM's criticism of the revenue equalisation formula (REF) but held that the criticism did not detract from the utility of this criterion for assessing the capacity of a state to raise resources. It considered, though GOM did not suggest it, that a more sophisticated REF could be evolved using multiple factors as independent variables in the regression analysis to estimate tax effort. (But this does not resolve the basic problem. See Note 3.) It mentioned the study 'Relative Taxable Capacity and Tax Effort of States in India' done by the National Institute of Public Finance and Policy, which it had commissioned for this purpose. But the VIII FC wisely concluded that the comprehensive formula would be quite complicated and its assumptions questionable, and opted for the less complicated income-distance formula (DF) considering that the p/c SDP was not only a good indicator of relative backwardness but also of the capacity of states to raise resources.

The VIII FC, therefore, recommended that 25 per cent of the divisible pool of excise duties should be distributed among states by population, 25 per cent by the IIF (IATP), and 50 per cent by the DF. But, since under the DF, Punjab, with its highest p/c SDP, does not get any share, and since the weight of the DF had been increased to 50 per cent, the FC used a 'special device' to adjust the DF by assigning a notional distance to Punjab equal to

Punjab's distance from the next highest state of Haryana, thus reducing the shares of all other states in the process. As we shall see, this illogical device of 'notional' distance proved to be the thin end of the wedge that was used to distort the DF.

X FINANCE COMMISSION

As in the case of the VIII FC, the X FC's work marked an ebb from the preceding surge. (We break the sequence and review the work of the IX FC at the end, because, besides the second surge in the use of sophisticated statistical techniques, it also created some other serious issues.) The distinguishing feature of the XFC was that it used the same set of criteria and formulae for the statewide distribution of the divisible pool of both excise duties and income tax[9]. It recommended that the amounts be distributed as follows: (i) 20 per cent by 1971 population, (ii) 60 per cent by the income-distance formula (DF), (iii) 5 per cent by adjusted area, (iv) 5 per cent by the index of infrastructure, and (v) 10 per cent on the basis of tax effort. Of these (ii), (iv) and (v) deserve scrutiny and so also the inverse income formula (IIF) which the FC rejected.

Tax Effort

Although the FC was required to take states' tax effort into account, it considered that since the tax bases of the states differed, tax effort must be related to some notion of tax potential. For want of data the FC had to use p c income (SDP) as a proxy for the aggregate tax base. It concluded that the tax effort could then be measured by the ratio of p c tax revenue to p c SDP. However, it then moved away from this position by stating:

5.45 ... We felt that there was still a need to provide for an adjustment for states with poorer tax-bases. If the tax effort ratio as defined above is divided by p c income, it would imply that if a poorer state exploits its tax base as much as a richer state, it gets an additional positive consideration in the formula. Thus, using an index of tax-effort, as measured by the ratio of per capita own tax-revenue to the square of per capita income, the respective shares are worked out after scaling by population. ... (Emphasis added.)

To postulate that the capacity to raise taxes (relative to p c income) itself increases as p c income increases makes economic sense. But, from this position, the decision to divide the p c tax by the square of p c income was arbitrary. (Why not divide by any other power (>1) of p c income?) The FC, which commanded consultancy

resources, should have seen more closely the statistical relationship between p c tax and p c SDP. Using data given in Annexures V 3 and V 4 of its report, this author found that the correlation coefficient (0.28) between p c SDP and tax ratio was statistically insignificant showing the weakness of the original postulate. A log-log regression analysis yielded the estimate of the power to which the p c SDP should be raised (as a divisor) to be 1.35, much smaller than the power of two to which the FC raised it, and that too statistically very insignificantly different from unity. Clearly, by its crude arithmetic, the FC arbitrarily and unjustifiably plumped for the poorer states and penalised the others.

Infrastructure Index (ISI)

For greater progressivity in devolution the X FC decided to use the criterion of relative infrastructure development. It got an index of infrastructure (ISI) constructed through a commissioned study by 'eminent' economists, and used it by the distance formula with the adjustment for the highest value state. The FC's report in its Appendix 5 gives only the excerpts from the study without the data it used. This imposes severe limitations on the examination of the study's procedure and of the resulting findings.

The study chose to measure directly the available infrastructure facilities because the (two) alternative measures were "not helpful in devising a measure which can identify the extent and nature of action required at the level of states in the union". It measured infrastructure facilities in the states "in terms of" eight sectors. Suitable indicators were worked out for every sector for 18 major states (in terms of population). Then the usual two-step approach was followed. First, the indicator values were converted into index values expressing them as ratios to their all-India averages. (The excerpts are rather unclear about this.) When the number of indices was more than one for a sector, the first principal component (PC) was calculated and used as an index for that sector. (Whether the index values proper, or their deviations from the mean, or their standardised values were used for the PC analysis is not mentioned. The results of the PCA depend upon the choice.) At the second step, the index values were 'aggregated' as a weighted total with the weight of an index proportional to its correlation coefficient with p c SDP. It appears that the values of the ISI are the percentage ratios of the aggregates to their all-India total. The Annexure V 5 shows the index values for all the 25 states with their all-India (all-

state?) average equal to 100. On a host of material points, some of which are discussed below, the ISI is questionable.

The unit of the values, which are percentage ratios, has been strangely described as rupees! It is not clear how the index values were worked out for smaller states with their data having 'numerous gaps' (the reason why they were excluded in the construction of the ISI). The average of the 25 index values, or of those of the 18 states, unweighted or weighted by population or area, differ considerably from 100, the all-India average shown in the table.

The first step of scaling indicators into indices and the second step, of determination of their weights can both be taken separately in several ways, yielding several different equally good ISIs whose values, when used in the distance formula, would generate very different sets of statewide shares, making the choice of the particular ISI the study constructed an arbitrary one. At the second step, if the weights are determined by optimising a meaningful 'objective function', to that extent at least, the composite index ceases to be arbitrary. The study chose to assign weights to the indices in proportion to their correlation coefficients (R) with p c SDP. First, the relevance of this relationship is not understood as the ISI was to be used in addition to the DF based on p c SDP. Second, the R of the ISI with p c SDP is seen to be quite small (0.63). Third, if R was important, the best linear function, which will have the maximum R with p c SDP, will be the multivariate linear regression function of the p c SDP on all sectoral indices, and that should have been taken as the ISI. (The degrees of freedom, as the IX FC showed, are not important!) The weights in it will also adjust for the difference in scaling at the first stage.

However, that will be only a better statistical procedure. But the study did not demonstrate how the ISI would meet its objective of identifying "the extent and nature of action required at the level of states in the union". This leads to another question. The study chose indicators which directly measured available "facilities". Since the ISI was to indicate governmental actions, only such facilities as are financed directly, or aided financially, by governments at various levels should have been taken into account. It is not clear whether the indicators such as hospital beds measured only this governmental activity. Further, since the values of such indicators can be directly changed by governmental action, they cease to be statistical variables, and their covariances or correlations, on

which the PCA is based, have little meaning.

The ISI, statistically produced as a weighted total of component indices, establishes a numerical equivalence between them: between roads and hospitals and schools and banking offices, etc. This logically leads to a strange conclusion that in practice the various facilities are substitutes for one another to reach the same level of infrastructure development! Such are the perils of constructing a composite index from development indicators which are basically not statistical variables and whose values can be changed by direct governmental action.

The study, and by implication the FC, used data on such items as irrigated area, railway route length, number of registered motor vehicles, or post offices and telephones, from a private information supplying firm. Does this mean that the corresponding government departments do not publish this information or did not provide it to the FC? This is indeed a regrettable state the government's statistical system seems to have reached. Apart from this being unfair because the

firm's information is not accessible to the public, the aspects of public responsibility and accountability of the firm supplying information are absent in such an information use for the policy decisions of the government. Worst, the FC did not publish the data the study used, and published only the excerpts from the paper of the study. (The author understands that the full paper has not been later published in an academic journal.) The FC thus deprived the state governments of the opportunity to understand the process of generating certain numbers that it used to distribute a part of the divisible pool.

Adulteration of Distance Formula

The X FC dropped the inverse income formula (IIF) because of its convexity which makes the middle income groups bear a relatively higher burden of progressivity implicit in it compared with the distance formula (DF). (Refer to its graphs [10].) The FC transferred its weight to the distance formula (DF) increasing its weight to 60 per cent. This large weight led the X FC to the same 'special device' of the VIII FC of assigning a notional

distance to the highest per capita GDP state. But because there was a further perceived problem since the time of the IX FC, it followed that commission's approach to further modify the pure version of the DF, which we shall call PDF here onwards.

By the time of the IX FC, Goa had become a state and that too with the highest per capita GDP pushing Punjab to the second place. But the IX FC did not assign a notional distance to Goa equal to the difference of its per capita GDP from that of Punjab. Its convoluted reasoning for the strange decision it took (First Report) was as follows [11]:

We, however, do not consider Goa as a representative state for the purpose of measuring the distance of per capita income among states, since it is too small in area and population. Besides, the data for State Domestic Product for Goa are available for only two years. Taking all the relevant factors into consideration, we have adopted Punjab, which has the second highest per capita income, as the highest per capita income state for purposes of measuring the distance factor. At the same time, in order

Notes: (1) ** PDF = Pure Distance Formula.

(2) *** p c share = per capita share in Rs when the total amount distributed is Rs 10,000 crore.

(3) Distance (I): From maximum p c GDP; (IA): Same as (I) with national dist Rs 368 for Goa; (II): As per X Fin Com. (III): From p c GDP [Goa + (Goa - Punjab)]; (IV): From p c GDP [Punjab + (Punjab - Maharashtra)].

(4) The line across the table separates the states into two groups: with below, and above average p c GDP.

(5) @ = Infinite.

to protect the interests of both Goa as well as Punjab, we have adopted the distance of the next highest income state, which in the present reckoning is Maharashtra, for measuring the notional distance. Thus the income distance of the three states, namely, Goa, Punjab and Maharashtra would be at par *inter se*.

In the Second Report, when SDP data for Goa were available for three years, the only change it made was to say that: "Also the data for the state of Goa are available only for a few years"[12].

The two reasons, one transitory and one permanent, given by the IX FC for this double adjustment of distances were specious. For what was materially relevant was not the number of years of availability of estimates for Goa's SDP, but whether these estimates were available for the specific three years for which the FC used the SDP data for all other states, and second, whether they were comparable estimates prepared by the CSO. They were, on both these counts. Further, that Goa is small in area and population does not make it any special, for it is a state, which is all that matters, and Nagaland, Mizoram, and Sikkim had smaller population, and the last two have a smaller area than it. Since distance is the difference between the p c SDP of two states, the distances of these three small states from Punjab, for the same reasons, are also unrepresentative of whatever true character the FC was looking for in a state to be representative. Thus viewed, no state can qualify as a true representative of others in most aspects. Therefore, to consider Goa to be unrepresentative as a reference point for distance measurement lacks any basis. Once an FC decides to use a single catch-all criterion such as p c SDP to make all states comparable, to depart from it to show special consideration to a particular state (actually to two states) is grossly arbitrary. The IX FC adopted the variation after, as it said, taking "all the relevant factors into consideration", but did not disclose, as it should have, what those factors were. It is not known whether it explored other mathematical ways of handling the situation; perhaps, it did, and rejected them for some special reasons.

Mathematical Politics of Distance Formula

The X FC toed the same line[13], although Goa's SDP data were available to it for several years. We shall analyse the situation created by the adjustment using its data and results given in Appendix 4 of its report. For the 25 states arranged in the ascending order of their

p c SDP, Table 1 gives these data in its first four columns and the income distance from Goa (distance-I) in its fifth column. The percentage shares of states, by pure distance formula (PDF) are shown in column (6) and the p c shares of the states (for 1971 population) in column (7), assuming the total amount distributed among them to be Rs 10,000 crore. The average p c share of all states works out at Rs 184.13. (Some of these results are shown in the FC's report; the differences from them are due to rounding.)[14]

The average p c SDP of states, weighted by 1971 population, works out at Rs 3,625. The dotted line drawn across the table separates the states into two groups of below and above average p c SDP states. At the uppermost end of the income scale the p c share drops sharply from Rs 98.25 for Maharashtra to Rs 18.124 for Punjab and zero for Goa.

Faced with this situation the X FC followed its predecessor and 'corrected' it in the same manner. Several alternative courses were open to it. The table shows the results for four alternative DFs in its columns (8) to (11), and for the IIF in column (12). They show the percentage gains(+) and losses(-) in shares by the alternative formulae in comparison with those by the PDF. Column (12) shows that under the IIF, all states lose in their shares, except Bihar at the lower end, and Arunachal Pradesh, Sikkim, Haryana, Maharashtra, Punjab and Goa at the upper end. The latter situation is anathema to any FC. Further, under the IIF the elasticity of p c share with respect to p c SDP is always (minus)1 over the entire income scale, while for the PDF the absolute value of the negative elasticity coefficient increases with p c SDP. That is the merit of the PDF, but not exclusively. The reasons for rejecting IIF in favour of the PDF might be deeper than the ostensible reason of the convexity of the former. For, the adjusted DF is also convex as the graph 4 on page 173 of the X FC's report shows.

Alternative IA: The first simple alternative was to assign, as the VIII FC did, a notional distance to Goa equal to the distance of the next below high p c SDP state of Punjab from it, that is, Rs 368. The p c share of both Punjab and Goa would then have been Rs 18.121 and the shares of all states (under PDF) reduced by 0.01441 per cent to contribute to Goa's share. [Column (8) of the table.] But this alternative pits Goa, the gainer, against the remaining 24 states, the losers. Politically rather inconvenient.

Alternative II: The statistically enlightened FC could not have been unaware

of the two important mathematical properties of the PDF. An increase of distance of any state reduces the shares of all other states. The second, not so obvious, but easily established, is that if the reference point, from which all distances are measured, is moved down the p c SDP scale, the shares of all below average p c SDP states increase and those of the others decrease. (The opposite result is obtained if the reference point is moved up.) If both changes are made simultaneously, the two effects will be in opposite directions for the below average p c SDP states some of which might gain in the process. This might conveniently divide the 24 loser states making some of them gainers in the process of adjustment. This is what the IX and X FCs chose to do. They lowered the reference point from Goa's p c SDP to that of Punjab, and assigned the same notional distance to both Punjab and Goa equal to Maharashtra's distance from Punjab. The p c share of the three states was made equal to Rs 87.74, thus increasing the share of Punjab by nearly four times that under PDF [column (9) of the table]. Of the remaining 23 states, the shares of 19 states, Tripura to Maharashtra increasingly reduce, and those of Bihar, Uttar Pradesh, Orissa and Rajasthan increase! The adjustment killed adroitly two birds with one stone: It first increased Punjab's share by nearly 400 per cent and assigned an equal p c share to Goa, and simultaneously divided the rest of the 23 states into two groups of losers and gainers creating a vested interest of the populous gainers in the perpetuation of this particular solution to the problem of protecting the interests of Goa.

But the VIII to X FCs did not see the illogicality of introducing a notional distance in the PDF. One can assign a notional value, such as income or area, when it does not depend upon any other value. Distance is an altogether different kind of measure that needs two values: One, of which distance is measured, and the other, from which it is measured. Therefore, forgetting Goa for a moment, when the distance of Rs 1,627 is assigned to Punjab (p c SDP Rs 6,996), the reference point from which Punjab's distance is measured becomes, by implication, (6996+1627=) Rs 8,623. But, for all other states the reference point remains Rs 6,996, Punjab's p c SDP. Thus we have in effect two reference points in a single distance formula which distorts its very concept. When, in addition to Punjab, the X FC assigned notional distance to Goa, it created three reference points making its DF a

caricature of the PDF. Mathematics and illogicality do not go together. The FCs should not distort the logic of the mathematical DF if they wish to adopt it. Their objective to assign a share to Goa could have been served in several ways. Two alternatives are illustrated in the table.

Alternative III: If Goa is to be assigned a positive distance, following VIII FC, that distance should be equal to Punjab's distance from it, that is Rs 368. This means the reference point for measuring all distances should be raised to Rs 7,732 which equals Goa's p c SDP of Rs 7,364 plus Rs 368. The resulting changes in shares are given in column (10) of the table. Compared with the shares under PDF, the shares of lower income states go down and of others increase, the change being larger the farther away the state's p c SDP is from the average. But the results are much better than those under IIF for the middle p c SDP states.

Alternative IV: If for the specious reasons the IX FC gave and the X FC accepted, Goa is to be overlooked as atypical and Punjab is to be assigned a distance of Rs 1,627, equal to Maharashtra's distance from it, the reference point for measuring all distances should be Punjab's p c SDP of Rs 6,996 plus its distance of Rs 1,627, that is, Rs 8,623. The resulting changes in shares, shown in column (11) of the table, are much larger than those under the III alternative, because the reference point is higher, but follow the same trend.

This does not exhaust the possibilities. There is a whole class of alternative DFs possessing the same quality of PDF that the relationship between y : the p c share and x : the p c SDP is graphically represented by a downward sloping (to the right) straight line ensuring numerically increasing negative elasticity coefficient of the former with respect to the latter as the latter increases. The two conditions the straight line should satisfy are that within the range of x values, y remains positive, and that it must pass through the point (m_x, m_y) , where m_x and m_y are the weighted means of x and y (weighted by 1971 population), since the p c share for the mean p c SDP must equal the mean p c share. The straight line will be fully specified if one more condition is imposed on it. Two simple ways of doing this are:

(i) Assign the value of y (p c share) to a state with the known x (its p c SDP) value; for example, a positive value can be assigned to Goa's p c share.

(ii) Decide upon the ratio of p c shares of two states; for example, as implicit in

the IIF, set the ratio of p c share of Bihar to that of Goa equal to the inverse ratio of their p c SDPs.

The FCs will not adopt any of these alternatives because under them, compared with the PDF, which the FCs have taken as the standard for comparison, the p c shares of the below average p c SDP income states will be less. But is it right to take the PDF as a standard for comparison?

A Re-examination of the PDF

It is high time to critically re-examine the PDF especially when, from its modest beginning (20 per cent weight), it has become the major factor (a weighty one at 60 per cent) in the distribution of divisible pool of both income tax and excise duties that has consequently led to its distortion.

First, the fact that the maximum p c SDP state is denied a share under it is itself its weakness. For the question is of relative backwardness. The maximum p c SDP state cannot be considered so advanced in an absolute sense as not to qualify for sharing in the distribution of a large part of the divisible pool. The formula must be such that, without provoking its distortion to make a special case for that state, it provides a share to all states.

Second, the simplicity of the PDF hides a basic statistical weakness. In statistical terms, formulating decisions on the basis of the maximum value, even if it be three years' average, is not desirable because that is a relatively unstable statistic. The attempt should be to use a measure based on all observations. The V FC used a distance formula taking the average p c SDP as the reference point thus excluding all above average income states from distribution. The VI FC criticised this formula observing that it "affected most adversely those states whose per capita income happened to be just above the dividing line" because of the "known margins of errors in national income data" [15]. For the same reasons, it is not advisable to use the maximum p c SDP, nor the p c SDP of any state, as a reference point for measuring distances as it affects the shares of not only the states whose p c SDP is nearer to it but of all states.

Third, a subtle point of theory. The formula lacks logical consistency with its basic objective, which, putting it simply, is to introduce, because of the disparity in their p c SDP, disparity in the p c shares of states in an opposite direction. Therefore, if the latter disparity decreases, the formula should also ensure mathematically that the disparity in the p c shares reduces *pari passu*. But this would not happen when

the distances are measured from the maximum. For, even if, hypothetically, the p c SDPs of the states differ slightly (relative to their average) among states, there will always be a maximum value, and the PDF will result in a very large disparity in the p c shares. It can be shown, by simple models of change, that the relative variation in p c shares determined by the PDF is totally insensitive to the changes in the relative variation in the p c SDPs (see Note 4).

The reference point for measuring distances should not be, therefore, based on the single value of the maximum p c SDP or on the p c SDP of any state, but on a statistical measure (or measures), which uses all p c SDP figures, such that the disparity in the p c shares of states gets directly related to the disparity in their p c SDPs. For example, the Planning Commission used to adopt a distance formula with twice the average as the reference point. (This was perhaps a product of serendipity rather than of statistical ingenuity.) When the maximum is less than that value, the formula makes the coefficient of variation of the p c shares equal to that of p c SDP. With Delhi now a state, the FC should develop and faithfully adopt a more statistically satisfactory formula, rather than retain the present PDF and distort it thrice.

IX FINANCE COMMISSION

If the VII FC rode on a surge in statistical analysis, the IX FC did so on a super-surge of econometric methods. That was its major distinguishing feature. To discharge its onerous responsibility to adopt a normative approach in assessing receipts and expenditure on revenue account of the states and the centre, it had to almost totally depend upon commissioned expertise (three consultancy institutions and one consultant). That produced mammoth and complex econometric work: more than two dozen regression exercises using dummy and proxy variables, complex models, restricted least squares estimation procedures, etc, a review of which would be a sizeable study had the FC's reports given the data used in the analysis. Attention is focused here mainly on the issues generated by the FC's adoption of complex methods in its work.

FIRST REPORT

The methodology used by the FC in its First Report and its results are given in its Appendix I, but not the data underlying the results (which would have taken only a page and a half) rendering a critical examination of the methodology and the

results impossible. Even then a few comments may be made. First, inadequate data: 10 parameters were estimated when the total number of observations for the first group of four states was 20 leaving the degrees of freedom (df) for the residual sum of squares to be only 9, smaller than the number of df due to regression! For the other two groups, the situation was only a little better. Second, the values of 'R-bar Square' were so close to unity as to make the model almost mathematical instead of statistical that it was supposed to be. Third, it is not clear whether the observed differences between the regression coefficients of state dummies (for example, Punjab and Haryana, Andhra Pradesh and Tamil Nadu) were statistically significant, and if not, how the results were revised. On the whole, the exercise seems to be too simplistic to meet its serious objective.

The second distinguishing feature of the IXFC was its 'glasnost' (in its own words). It discussed its paper on methodological and conceptual issues with a group of 10 economists and econometricians to give finishing touches to it, and later, in a meeting with the states' finance secretaries and the officials of the ministry of finance in which "there was a broad acceptance of the approach and methodology" [16]. The IFC's first report makes a special reference to the appreciation by the economic dailies and journals of its 'glasnost'. Surely, that could be creditable. But nagging questions linger. Openness has meaning if it is between equals. To ask for views on the approach presented in abstract econometric terms could not be exactly fair. Did the states' finance secretaries possess that necessary grasp of econometric methods to understand the approach, or suggest modifications in it, before they 'broadly' accepted it? Had not they only two alternatives, one to accept *as fait accompli* the proposed methodology formulated as it was by 'eminent' econometricians, or to reject it outright as too abstruse for adoption in the practical decisions about revenue sharing between governments? Few finance secretaries would follow the latter course.

The third distinguishing feature of the IXFC's work was its adoption of the same criteria, with the same weights, for the inter-state distribution of the divisible pool of both excise duties and the income tax, after 10 per cent of the latter was assigned to the states in proportion to 'collection' (assessment) [17]. The four criteria (with their percentage weights) it adopted were: population (25 per cent), income distance (50 per cent), inverse of p c SDP (12.5

per cent), and the percentage of poor as estimated by the Planning Commission (12.5 per cent).

Second Report

In its second report the FC retained these criteria except the poverty percentage. The reasons for dropping it make interesting reading [18]. The methodology of its estimation was not considered sound and the reliability of estimates considered questionable by the states. The economists the FC consulted advised that the degree of poverty, as such, was not a relevant criterion in deciding budgetary allocations; the same argument made by states would have fallen on deaf ears. "Since, even the backward states ... did not favour the use" of poverty criterion, the FC decided to "drop it" ignoring that backwardness and poverty were different aspects. The criteria the FC recommended for the distribution of the divisible pool of income tax (and their weights) were: (1) collection as measured by assessment (10 per cent); (2) income-distance (45 per cent); (3) 1971 population (22.5 per cent); (4) composite index of backwardness (CIB) (11.25 per cent); and (5) inverse of p c income (11.25 per cent) [19]. For excise duties, the same criteria, except that of collection were recommended with weights of 33.5, 25, 12.5 and 12.5 per cent for criteria (2) to (4) respectively, with the balance of 16.5 per cent to be distributed among 'deficit' states in proportion to their 'deficits' [20].

Composite Index of Backwardness (CIB)

The FC chose the CIB to substitute the poverty percentage it ejected and "in order to supplement the use of p c SDP". It was evolved by the FC on the basis of 1981 Population Census data and had two components with equal weights: (1) the population of scheduled castes and scheduled tribes, and (2) the number of agricultural labourers. In the FC's view, the two served to reflect poverty and backwardness. The data for the calculation of the CIB are given in the Annexures V3A and V3B of the Second Report.

The Annexures give not values of an 'index' but the percentage distribution over states of population of SCs and STs and of the number of agricultural labour and what is called 'weighted shares' are simple arithmetic means of the two percentages. Second, a more serious point involving a policy matter, these percentage shares are directly based on population numbers of the 1981 Census although the mandate to the FC was to use 1971 population figures. In fact, in its First Report, the FC itself

had justified the use of 1971 population [21]. The third, and the most serious point is that the simple exercise of constructing the CIB is materially flawed because of the statistical duplication of numbers. Though the first component is population, and the second the number of (main) workers who were agricultural labour and the two are not additive, in terms of the population that the second reflects, there is a clear overlap. A substantial percentage of agricultural labour in all major states belongs to the SCs and in most cases the percentage is more than twice the overall percentage of SCs among the state's working population. The same, to a lesser extent, is true of STs; the ratio is about 1.5. Since the two components, SC/ST population and agricultural workers, are to be taken together as a major section of the class of poor and of backward, the duplication needs to be removed by excluding from agricultural labour those who belong to the SCs and STs before their percentage distribution over states is worked out. The author's calculations show that by its defective CIB the IFC assigned substantially larger shares (up to 24 per cent) to those states which have a larger than average proportion of SCs and STs among their agricultural labour, and substantially smaller shares (up to 15 per cent) to others.

Econometric Work

The mind-boggling econometric work of the IFC consists of 15 regression exercises for normative estimation of tax and non-tax revenue, and an equal number of such exercises for revenue expenditure. The former set is an extension of the macro-level approach of the first report to individual taxes and sources of revenue. The fact of paucity of degrees of freedom (translation: small number of observations) dawned upon the FC by then, and out went the state dummy variables and in came the proxy variables to measure the tax bases. For normative estimation at the state level the state dummies are important, and if something is to give way it should have been the time dummies. For their effect was accounted for in the value-variables as they were at 'current' prices. The estimated coefficients of time dummies do not differ much and in several cases are statistically insignificant. Even after omission of state dummies the number of observations was too small to set up regression equations containing half a dozen or more explanatory variables. Any statistician would demur at subjecting such scanty data to a multivariate analysis of this order, but not the intrepid FC firmly

believing that greater complexity enhances the soundness of its recommendations. Some proxies made strange bed fellows. Ordinary mortals in the states' finance departments might wonder what road or railway length per unit of area has to do with sales tax, or with stamp duties or registration fees, or with state excise duties; or for that matter, what per capita energy sales to ultimate consumers with sales tax. But their observed high correlation coefficient with the tax seems to have forced a relationship between the two. Such are the miracles which can be performed by the magic wand of the regression equation.

But econometrics did not hold full sway. First, the FC did not adopt fully the econometric estimates of normative revenue and expenditure. Those by alternative traditional methods were also worked out and some kind of compromise was achieved by moderating the former. This is indeed strange, for why either or both of their 'compromise' should be considered good enough is incomprehensible. Second, the econometric approach did not receive a unanimous unreserved backing within the FC. One member, Justice A S Qureshi, in his Note of Dissent and General Observations [22], pointedly questioned the very appropriateness to the Commission's work of these methods adopted so readily and trustingly by the FC. The relevant paragraphs 6.3 to 6.6 of his Note deserve to be fully quoted for the perspicacity of his observations, but considerations of space permit the presentation of only the summary of his main points.

Justice Qureshi objected to the normative estimates of revenue and expenditure based on the econometric approach that relied on "proxies, dummies, variables, etc". Given the wide variety of the social and economic conditions of the states, he doubted the efficacy of this approach. A serious aspect of this work he noted was that "certain considerations have been built in to arrive at the desired results". This very serious observation about the built-in slant in the results, an impression carried by some, was for the first time authenticated by a Commission's member. Although the econometric estimates were 'moderated' with respect to figures arrived at by traditional methods, he did not consider it a happy state of affairs. The Commission's reliance on econometric methods made it neglect the usual process of calling forecasts from states and of detailed discussions with the states' representatives. Qureshi found that the process of estimation by econometric methods was a mystery as regards their formulation,

assignment of weights to various factors, and their treatment of specific conditions obtaining in different states. When he tried to understand them he was "told that there were too many details involved in the process and it was difficult to explain or check them". Though he had mental reservations about these estimates, he found that "it was too late" and "he had no choice but to accept" them. He also noted that his colleagues in the FC also were not apparently satisfied with them. In his view "more thorough study of the subject" should have been done, better data collected, and discussions with states' representatives and subject specialists held for evolving a sound normative approach.

The majority of the FC's members, in their four paragraph Note, neutralised this pointed criticism of Commission's methodology by ignoring it [23]. This, from an FC which claimed 'glasnost', towards its own member. One can imagine the treatment any criticism by a state government would have received at its hand. But it should not be surprising because the IX FC, not content with its complex econometric work, dreamt that "Finance Commissions in the future may bring about further sophistication and refinement in this exercise" [24]. And none likes to be roused from a reverie by a reminder of reality.

III

Concluding Observations

An FC's mathematical formulation of its recommendation is a welcome development as its logic becomes clearly understandable and it ceases to be a subjective judgment. However, the formulation must have a real meaning in substance, not a contrived one, and once made, it should not be distorted to protect interests of certain states. The inverse income formula lacked such a meaning and its interpretation as income adjusted total population stretched imagination. The X FC's tax effort formula arbitrarily used the square of the p c SDP as a divisor to favour the low p c SDP states.

The progressive income distance formula is harsh on states at the upper end of the p c SDP scale. This was not a serious matter when its weight was small. But when half or more of the divisible pool was to be distributed by it, to protect the interests of the highest p c SDP states, rather than modifying it suitably, the FCs distorted logic employing an empty rationale, which had a distinct political flavour, to dress their arbitrary decisions in a mathematical garb. The formula is not statistically sound and it is high time that

it should be founded on firmer statistical basis as suggested above.

Compared with the mathematical methods, the statistical methods can provide a more meaningful, but less firm, basis for an FC's recommendation. All those so far employed are shown to be flawed in some manner. Hasty statistical exercises run the risk of a mistake; Raj Krishna's in determination of urban poverty lines, and the IX FC's of duplication of numbers in its composite index of backwardness. They may end up with selective use of results of private research, like Raj Krishna's selection of rural poverty lines, making an FC's recommendation equally arbitrary. Sophisticated methods of constructing composite indexes have their own weaknesses. The VII FC had concluded that such a construction "on the basis of individual or partial indicators is beset with the problem of relative weights to be assigned to these indicators. Any set of such weights decided a priori or on the basis of factor analysis is bound to be highly arbitrary" [25]. Regardless of this the X FC used the index of infrastructure which, as pointed out above, was to some extent arbitrary and could have been improved, but still leaving its relevance to its objective questionable. An FC should recognise that because of an inherent element of indeterminateness in such multivariate methods, they do not yield meaningful solution to its problem.

The implicit trust in regression analysis is misplaced. The revenue equalisation formula of the VII FC did not achieve its purpose because it used a single explanatory variable. But even with multiple factors, the formula would not have worked, as the VIII FC thought, because with the regression approach one gets estimates, not true values, and they have their 'errors' of estimation. The use of these estimates without cognisance of these errors is not statistically justified. The entire econometric work of the IX FC could be reviewed from this angle.

DESPERATE PURSUIT OF PROGRESSIVITY

The increasing concern of FCs to inject greater progressivity into the statewide distribution of the divisible pool made them reduce the weight assigned to population (from 80 to 20 per cent), and motivated them to continuously search for and use new progressive criteria by mathematical or statistical formulae for the distribution of the large remainder. Of these formulae, only the distance formula of the VI FC has proved more than durable as it also gained in weight to 60 per cent. The inverse income formula, produced by

the VII FC, retained by the VIII FC, reduced in weight by the IX FC, was rejected by the X FC. The VIII FC continued with it because it found that most states had not objected to it, while the X FC discovered its convexity and rejected it in favour of the distance formula. The truth of the matter seems to be that the distance formula is the sharpest cutter of the shares of the higher income states and was, therefore, favoured by it. The poverty criterion experienced a swing; created by the VII FC, dropped by the VIII FC, temporarily brought in with reduced weight by the IX FC but on second thought finally rejected by it, it was ignored by the X FC. The IX FC after adopting the poverty criterion in its first report rejected it in the second report because even "the backward states did not favour its use" ignoring that backwardness and poverty are two different aspects, and that backward states would not mind its discontinuance because the criterion is not of special advantage to them as the higher income states also have a large percentage of poor. Other progressive formula made their transient appearance: the composite index of the V FC, the composite index of backwardness of the IX FC, and the index of infrastructure of the X FC; whether the last survives with the XI FC remains to be seen. The last two appear to have been invented to substitute the inverse income formula and the poverty percentage which were retired.

One would be bewildered by these changes: the introduction of the inverse income formula and poverty percentage for certain substantive reasons, and their rejection for certain other reasons, and wonder whether they do not make light of the serious exercise of devolution. The lofty aim of making devolution progressive seems to have been thus translated into the selective mowing down of the relative shares of higher p.c. SDP states. And towards this simple end the FCs seem to have been merely engaged in dropping one formula and cobbling another to take its place.

CONSEQUENCES OF SOPHISTICATION

The increasing sophistication of statistical methodology had two undesirable consequences. First, from clarity to obscurity, if not mystery, changed the character of FC's recommendations to such an extent that it is doubtful if even the FCs' members, some of them at least, understood the process of their recommendations. The VIII FC wisely avoided this situation, and Justice Qureshi, a member of the IX FC, candidly confirmed it. Coupled with this is the FC's neglect to provide fully the

methodological detail and data used by them for their exercises, deepening the cloudiness of an FC's recommendations into opacity. Lack of transparency in the use of a mathematical or statistical formula makes it indistinguishable from an arbitrary recommendation. It deprives state governments of an opportunity even to verify, understand and examine the full implications of the assumptions made, the results produced, and the soundness of the FC's recommendations. The participatory character of the revenue-sharing process is thus destroyed, an FC's claim to 'glasnost' notwithstanding.

The second point is about accountability. It was a member of the VII FC who first introduced a high degree of sophistication of statistical analysis in its work. But, at least, he was accountable to the FC, and the FC, in turn, to the parties affected for the disastrous mistake he made. Perhaps to avoid such a situation, starting with the VIII FC, an alternative course was followed – which is worse – to depend wholly upon commissioned external expertise. For obvious reasons such commissioned studies would adopt more sophisticated and complex methods. At least the VIII FC displayed the practical wisdom not to be swayed by the experts' work it ordered. But the FC's dependence on commissioned studies increased with the IX FC (and continued with the X FC) to such an extent that an FC's recommendations, using complex mathematical, statistical or econometric methods, are in effect framed by a third party which is accountable to none of those involved in this process of revenue-sharing. The 'eminence' of the experts, by itself, seems to lend a quality of unquestionable infallibility to the methodology they propose and the results they obtain, although eminence in one field is not transferable to work in another. The august institution of Finance Commission appears to be defensively taking some decisions by proxy and letting itself slide into a role of a dummy to that extent.

An FC's recommendations remain effective for five years. There is no redress available to state governments for those founded on technically questionable, implicitly arbitrary or outright defective statistical exercises. To be fair, an FC has, therefore, to be especially cautious about its use of sophisticated statistical methodology. It should recognise the distinction between academic research and its own field of responsibility, and judge whether the sophisticated methods are realistically applicable for the practical task on its hand. It would do well to pay heed to

Dandekar's warning[26] that the sophistication of analysis may be legitimate "in academic exercises which in their nature are exploratory. But it is clearly dangerous when academicians enter the field of operative decision-making without realising the exploratory and speculative character of ... academic work". A simple way for the FC to judge the issue would be not to let the technical sophistication of a method rise above that level beyond which it is incomprehensible to its members. It is in the interest of state governments, the main affected parties, to prevail upon the FC to be discerning in this respect if the decision-making process involving the allocation of thousands of crores of rupees is to remain subject to the imperative of accountability. Justice Qureshi made out, in para 1.9 of his dissenting note, a case for the establishment of a permanent secretariat for the FC manned by permanent and qualified persons[27]. For the purposes of continued accountability at least, his suggestion has a great merit.

XI FINANCE COMMISSION

The degree of sophistication of mathematical, statistical or econometric methods surged and ebbed alternately from the VII to the X FC. If this behavioural pattern were to repeat, one may witness another surge in the work of the XI FC. This review, it is hoped, should help the XI FC remain reminded of, and state governments remain alert to, the fallibility of these methods on the one hand and the serious consequences of their sophistication on the other. Otherwise, worse than what Madhav Godbole fears[28], its work will not be only a ritual but a complex ritual ostensibly sanctified by mysterious mathematical mantras and stupefying statistical stotras.

Notes

[It is not easy for an independent research worker such as the present author to carry out his work without help. In this case, even an access to FCs' reports and other published documents was not an easy matter. The author is grateful to the past and present officials of the government of Maharashtra: S G Prahbudesai, retired joint secretary in the planning department, B M Nagrale, director and R N Sathaye, additional director of the directorate of economics and statistics, for their ready help in supplying the needed publications.]

1 One practical problem with the IIF is that under it the p.c. share of a state, with its p.c. SDP equal to the mean p.c. SDP, is not equal to the mean p.c. share, but less than that. This is because for the IIF the (weighted) harmonic mean becomes relevant and decides the dividing line between states with above or below mean p.c. share

Since the harmonic mean is generally less than the arithmetic mean, the number of states with p c shares less than the mean p c share is larger under the IIF than that under the PIDF.

- 2 The size under the IIF is equal to (Total Population of a state)/(Its p c SDP)
Since Raj Krishna called the quantity

Poverty Population of a state)/(Its p c SDP) its income-adjusted-poverty-population[29], the VIII FC called the size under IIF the income-adjusted total-population (IATP) and argued that the IIF assigns shares to the states in proportion to the IATP. But why should it be called a type of population? The author understands that its reasoning, though not spelt out by it, was as follows. If the size is multiplied by a constant value, the distribution in proportion to this revised size will be obviously the same as that made using the original size. Suppose the constant is the (population weighted) mean p c SDP. Then the revised size for a state will be

$$[(A \text{ state's Population}) \times (\text{mean p c SDP})] / (\text{Its p c SDP}) = (A \text{ state's hypothetical SDP}) / (\text{Its p c SDP})$$

The hypothetical SDP of a state assumes its p c SDP to be equal to the mean p c SDP but takes into consideration its actual population. When this hypothetical SDP is divided by the actual p c SDP, we get a figure which is in terms of number of persons, that is, population, which is called the IATP. It is the population needed to produce the hypothetical SDP at the rate of actual p c SDP. This is unrealistic arithmetic of ratios and proportions, which ignores that p c SDP is only an arithmetical ratio of SDP, alter it is realised within the geographical boundaries of a state, to the population of the state. It is not meaningful, therefore, to work backwards to determine the population needed to generate a given SDP at a certain rate of p c SDP. The VIII FC also neglected that the two economic entities, the size of SDP and that of population, mutually influence each other and cannot be artificially separated. Apparently, the FC believed that its unrealistic measure possessed some real economic meaning.

- 3 Let Y denote the p c revenue potential, x the p c SDP, and a and b the estimates of the parameters A and B respectively in the estimated regression equation

$$Y' = a + bx$$

where Y' is the estimate of the revenue potential. If x_M is the maximum p c SDP and Y'_M the estimate of the maximum of Y, then the distance for a state the VII FC used in the distance formula based on the estimated revenue potential Y' is given by

$$(Y'_M - Y') = b(x_M - x)$$

From this it followed that the distance of estimated p c revenue potential is proportional to the distance of p c SDP, and therefore, the revenue equalisation formula of the VII FC degenerated into the distance formula based on p c SDP distance. This is what the GOM pointed out.

But there is something more. The right hand side of the last expression gives an estimate of the distance of revenue potential, and not its unknown real value. Every estimate has its estimation 'error' which can also be estimated from the regression analysis itself, if its assumptions hold good. (They may not.) This estimation error is not of the same magnitude

for the different values of estimated distance of revenue potential of the states, as it depends upon the distance of the p c SDP from its maximum, the larger this distance, the larger the estimation error. To treat the estimates of distances as real distances, without consideration of their estimation errors, will not be, therefore, a correct statistical procedure. This is true even for the multivariate regression using more than one factor, a point the VIII FC did not consider.

- 4 If y stands for the p c share of a state determined under the pure distance formula, x for its p c SDP, m for the mean of x , x_M for the maximum value of x , A for the value of p c SDP which is a reference point for measuring all distances, and CV(x) for the coefficient of variation of a variable x, then, it is easily established that if $A > x_M$,

$$CV(y) = CV(x) * [m / (A - m)]$$

From this it follows that if $A = k * m$, with $k > 1$, then

$$CV(y) = CV(x) * [1 / (k - 1)]$$

Thus, taking the reference point as a fixed multiple of the mean p c SDP ensures that the CV of p c shares is proportional to the CV of p c SDP, and, therefore, if the latter decreases or increases the former will also do so in the same proportion. In particular, if $k = 2$, that is, the reference point is twice the mean p c SDP,

$$CV(y) = CV(x)$$

the two CVs become exactly equal.

On the other hand, if $A = x_M$, the maximum value of x

$$CV(y) = CV(x) * [m / (x_M - m)]$$

This gives $CV(y) \geq CV(x)$ if $2m \geq x_M$, that is, when the maximum p c SDP is less than or equal to twice the mean p c SDP, the CV of p c shares is greater than that of p c SDP, otherwise the opposite result also holds good. It is not easy to study the behaviour of CV(y) as CV(x) changes, because the term $[m / (x_M - m)]$ on the RHS is expected to change in the opposite direction of the change in CV(x). But, assuming, not unrealistically, that the relative sizes of states' population and the ranking of the states by p c SDP do not change, it can be shown by some simple models of change in x values, that the CV of p c shares is insensitive to the changes in the CV of p c SDP. The first model is

$$x' = x + C + a(x - m)$$

where x' is the changed value of x, and C and a are constants suitably chosen. The second type assumes that the p c SDPs of states grow, linearly or exponentially, at constant rates in such a way that at some future date they all become equal.

Secondly, one may note that $CV(y) = 1/U_M$ where U_M is the standardised value of x_M , that is $U_M = (x_M - m)/s$, where s is the standard deviation of x. From this, one should expect, though it is not easy to prove, that CV of y, the p c share, will not depend upon the mean, standard deviation or CV of x but on the

number of observations of x and the statistical distribution function of x, the p c SDP.

Environment in Karnataka

A Status Report

Ecological Economics Unit
Institute for Social and Economic Change, Bangalore

This paper presents an overview of the present status of the natural resource environment in Karnataka, namely, forest cover and pastures, land use, soil erosion, watershed development, livestock and fisheries, reserves of mineral ores and their exploitation, industrial pollution and urban environment. Apathy of the government machinery towards these environmental problems has provoked popular movements linked to people's access to natural resources and to health concerns. But an institutionalised approach to these problems is needed.

I Introduction

THIS paper presents an overview of the present status of the natural resource environment in Karnataka, raising also some of the critical environmental issues which have emerged and responses to the same. Environmental problems arise both because of resource depletion and negative externalities caused by development processes and projects. To meet the goal of sustainable development, it is necessary to address both types of problems adequately. While it is difficult to give definite guidelines about what proportion of exhaustible resources can be exploited by the present generation for its own use and consumption, there is some consensus about renewable resources like fisheries and forests that their exploitation should be limited to the rate of regeneration. Even about exhaustible resources, we should periodically review the rate of their exploitation as against the stocks available, so that an informed judgment can be made about what the present generation should use as against what can be bequeathed to the future generations. Negative externalities like water and air pollution inflict severe welfare losses and reduce output as well (for example, cement dust and air pollution reducing crop yields). While quantifying the impact of these externalities is beyond the scope of this paper, their magnitude would be assessed. Wherever appropriate or feasible, we also compare the situation in Karnataka with the country as a whole.

Cecil Saldanha brought out six state of environment reports on Karnataka, the last one released in 1993. Each of these reports carried specialised articles on a few selected aspects of environment in Karnataka. The present report is inspired by Saldanha's work but has a different format, being a synoptic overview of environment, trying to do justice to most aspects within one

paper using latest available information. Regrettably, issues related to management of water and energy could not be included here, though water pollution is discussed.

The paper is organised as follows. In Section II, we deal with the state of land use including forests and grazing land. We do not go into details of cropping pattern, but restrict ourselves to broad categories of land use. This leads us to a programme of arresting soil erosion and promoting water conservation through watershed development in Karnataka in Section III.¹ In Section IV, we deal with the state of livestock and fisheries, which are renewable resources. Mineral ores and their exploitation come under exhaustible resources, dealt with in Section V. This leads us to Sections VI and VII, respectively on state of industrial pollution and urban environment in Karnataka. In dealing with these issues, we also comment upon official response to environmental issues in respective sectors. Environment is too serious a matter to be left to official bureaucracy alone. Environment lobbies and NGOs have also played an important role in alerting officials and people at large about environmental problems. This will be dealt with in the concluding section.

II Land Use, Forests and Pastures

Agriculture constitutes the major use of land both in Karnataka and the country as a whole, but more so in Karnataka. Taking together net sown area and current fallows, it accounted for 59.1 per cent of total geographical area in 1958-59 and 56.9 per cent in 1995-96 in Karnataka, as against 48.7 per cent and 51.3 per cent in India in the respective years. Though the proportion of land under agriculture has declined slightly in Karnataka, and increased slightly in India over these years, it still remains larger in Karnataka (Table I). The proportion of land under forests, as per legal status (not necessarily

under actual tree cover), increased both in the state and the country as a whole, from 14.4 per cent to 16.1 per cent in Karnataka, as against 17.9 per cent to 22.4 per cent in India during the same years. In spite of our western ghats, the proportion of area under forests is thus seen to be lower than the country's average.

Permanent pastures, cultivable wastes and other fallows taken together can be said to constitute broadly common property resources used for grazing. At least as per official data, the proportion of such lands declined only slightly from 15.4 per cent in 1958-59 to 14.5 per cent in 1995-96 in Karnataka, but a little more significantly from 15.7 per cent to 11.6 per cent during the same years in India. The role of such common property resources as a source of fodder has been declining over the years, and correspondingly the role of fodder raised in private holdings, including fodder crops raised commercially, has been increasing. With population increase and economic development, prices of livestock products have increased significantly enough over the years to make such a shift affordable to farmers, though this would have certainly affected landless labour and marginal farmers who have little or no land of their own as a source of fodder. Irrespective of trends as seen from official data, common property resources appear to have declined both in quantity and also in quality and productivity. There is reason to believe that land under agriculture is underestimated and that area under grazing lands is overestimated, mainly because encroachments into the commons for cultivation are not reflected in official land use data. This was corroborated from a micro level study in Karnataka [Nadkarni and Pasha 1991].

This observation could apply equally to forests, encroachments into which are also common. This is quite apart from the fact that even unencroached lands legally under the forest department may have lost tree

cover due either to officially permitted clear felling or to unauthorised cutting and exploitation by people around the forests. There are also other factors due to which the official land use data on forests do not really report the physical condition of land. This results in errors in both directions. In Uttara Kannada district, for example, due to some legal quirk, forest land submerged under reservoirs or leased out for cultivation totalling over 1,000 sq kms was still reported as forest land in land use statistics [Reddy et al 1986:2 and 3]. On the other hand, in Shimoga, Chikmagalur and Dakshina Kannada, these statistics underestimate the extent of forest cover. This is because significant fractions of physically forested land are under the jurisdiction of the revenue department; only land under the forest department is counted as forest land in official statistics whatever its physical condition. Not an insignificant part of the increase in the area under forests in Table 1, is because of transfer of lands from the revenue department to the forest department.

With the emergence of remote sensing technologies, it was hoped that an 'objective' and 'accurate' method of delineating land cover was now available. However, forest cover statistics by different (and sometimes the same) agencies show dramatic differences that cannot be explained simply on the basis of difference in definition. For example, the state of forests reports of the Forest Survey of India have indicated that 81 per cent of Kodagu district is under forest cover, though cultivated area as per official land statistics accounts for more than 36 per cent. Forest Survey of India's own maps published at 1:2,50,000 scale for 1990 indicate only 35 per cent area under forests including scrub vegetation. In general, reliable information on forest condition at the meso-scale is still scarce [Lele et al 1998a].

The most recent and reliable estimate of forest cover – natural and artificial, dense and open – in Karnataka as a whole comes to 13 to 14 per cent of the state's geographical area [NRSA 1983; Sinha 1988]. The forest cover estimated by NRSA for India as a whole is also 14 per cent. The districtwise distribution is not reliably known for the reasons stated above, but the districts with greatest proportion of forest cover are Uttara Kannada (70 per cent), Dakshina Kannada (60 per cent), Shimoga (40 per cent), Chikmagalur (35 per cent), Kodagu (35 per cent) and Mysore (30 per cent). [Menon and Bawa 1998; Bannur and Sharatchandra 1997].

Over the years, there has been a considerable loss of forest cover in the state. Taking a long period of 1920-90 in five western ghats districts, Menon and Bawa (1998) concluded that the extent of forest loss varied from 13 to 53 per cent, due mostly to extension of cultivation and coffee plantations and very little to submergence under reservoirs (Table 2). The largest loss of forest is seen to be in Chikmagalur and Kodagu district where coffee plantations now dominate. Estimates of loss of forests in the state as a whole are available from official sources for the periods 1956 to 1981, and from 1981 to 1998 (Table 3). In both periods, extension of cultivation has accounted for the largest share among all factors, accounting for almost two-thirds during the latter period, and development projects accounting for one-third of the loss. These figures do not indicate net loss of forest area, for some of it has been compensated by increase in forest area at least in quantity (area) if not in quality.

Between 1975 and 1982, however, the extent of forest cover in the state seems to have declined by only 1 per cent [NRSA 1983] as compared to a decline of 3 per cent for the country. Subsequently, the

forest cover appears to have remained constant or even increased slightly. But this increase comes in the form of forest plantations (typically monocultural and often using exotic species) resulting from afforestation activities, while the extent of natural forests continued to decline.² Afforestation activities since the early 1980s attempted to promote mixed plantations, although with limited success [Saxena et al 1997]. The long-term trend appears to have been one of shift from closed canopy forest to open canopy forest, and from evergreen to moist-deciduous vegetation types. Standing stock may not have declined in the same proportion as forest canopy, since human use results often in disproportionate pruning of crowns [Lele et al 1998b].

The plant species composition has definitely become less 'rich' as many rare and endangered plants were lost or rendered scarce. This happened during a prolonged phase of 50 years or more up to mid-eighties, during the drive towards replacing natural forests by timber and other commercial wood plantations. The decline in wild animal populations has been even more dramatic and visible [Gadgil 1984; Daniels 1993]. At least one bird (the Great Indian Bustard) is reported to be on the verge of extinction, and the Bengal Tiger is surviving only in protected areas. The reasons for this are a disproportionate increase in forest fragmentation, erosion of habitat quality due to changes in composition and densities, and significant poaching pressures.

Forest degradation has also adversely affected the availability of fuelwood and small timber to local communities dependent on them in certain areas. The ban on green felling has reduced the official supply of commercial fuelwood and timber also. Certain species like bamboo had depleted significantly even before the ban on green

felling (around 1983) as the then system offered bamboo to paper mills at a nominal price and there was no incentive for regeneration [Gadgil and Prasad 1978]. The same thing happened in a number of non-timber forest species like *Cinnamomum* sp and *Myristica* sp and a host of medicinal plants (K S Murali, personal communication to Lele; FRLHT unpublished data). The overall impression is unmistakable that the long-term sustainability of these forests, especially in terms of quality is in serious doubt.

A few comments on the official responses to the forest situation are in order. Till at least the mid-eighties, afforestation efforts were mainly oriented towards meeting commercial species like timber, softwood and fuelwood, reflected in the plantations of teak, eucalyptus and casurina. Even under social forestry phase from 1983 to 1992, the focus on these species was not changed. In many cases, social forestry plantations reduced the availability of grazing lands to villagers, who had to be content with tops and twigs. This led to protest movements led by NGOs like Samaja Parivartan Samudaya and led to a change of policy towards promoting mixed species plantations. Till 1992, however, the agencies of afforestation were the Karnataka forest department and such other government departments, operating in a centralised, bureaucratic, prohibitive and police manner.

From 1993 onwards, however, there has been a visibly increased focus on the involvement of local communities in afforestation mainly under joint forest planning and management (JFPM). This is supported by a £24 mn 'Western Ghats Forestry Environment Project' funded by the UK. The progress under the scheme has, however, been rather slow due to several factors: (a) restriction of the JFPM to only 'degraded' areas, which form a small fraction of actual forest used by local communities; (b) inadequate devolution of control to local communities; (c) poor fit with social realities;³ (d) problem of ensuring adequate incentives to locals; and (e) lack of enthusiasm among implementing forest staff [Saxena et al, 1997]. The number of village forest committees set up under this project up to September 1998 was only 400 in Karnataka, which compares poorly with the more than 2,000 set up in neighbouring Andhra Pradesh in a shorter time.

A clearly defined access to and exclusive control of the resource by local users may be a necessary but not a sufficient condition for sustainable management. For instance, many 'betta' lands in Uttara Kannada

where areca gardeners had exclusive access if not ownership were degraded due to indifference to regeneration [Nadkarni et al 1989; Lele et al 1998b]. 'Baane' lands in Kodagu under privatised access have all been converted to coffee plantations, and 'kumki' lands in Dakshina Kannada have in many places been converted to cashew or other plantations. This highlights the basic tension between different roles of forests, valued differently by different interest groups. Institutional innovations that enable local communities to be compensated for providing global benefits from forests, and a political environment and process committed to fairness and sustainability – both still largely missing – will be necessary for a successful resolution of these tensions.

In sum, though Karnataka has been endowed with a particularly rich forest flora and fauna and widely distributed network of pasture lands (including Amrut Mahal Kavals⁴), Karnataka's post-independence record of conserving them has hardly been encouraging. Forests and pastures have declined significantly particularly in quality, and regeneration efforts have had only a marginal success in addressing the problems.

III Soil Erosion and Watershed Development

Soil erosion is a major problem affecting the state particularly in its dry or rainfed areas. According to official sources (*Indian Agriculture in Brief*, 25th ed 1994, pp 22-25), 11.4 million hectares out of the total geographical area of 19.05 million hectares, i.e., 59.8 per cent was degraded in Karnataka during the early 1990s. This proportion is more than in the country as a whole, where the problem area is 53.2 per cent. The problem area includes both cultivated and uncultivated areas. Karnataka is a pioneering state in taking up soil conservation

programmes, but only 30.6 per cent of the problem area was treated up to 1992-93. Though it is higher than in the country as a whole (20.9 per cent), there is still a long way to go. The old approach focused only on soil conservation which was not very effective. It has now given place to a more comprehensive and integrated approach of watershed development which includes soil and water conservation in dry and semi-arid areas.

Watershed development is a holistic approach to improve and develop the economic and natural resource base of economically disadvantaged and ecologically fragile regions such as the dry and semi-arid areas. Instead of an administrative region, watershed is the

TABLE 3 LOSS OF FOREST IN KARNATAKA, 1956-1981 AND 1981-1998

Purpose	Area Lost (Hectares)	Percentage to Total Area Lost

Uttara Kannada	10251	9134	89	7806	76	92.6	0.0	7.4

Notes: (a) 1920 areas are estimated using Survey of India toposheets and hence should be considered as approximate. Data for 1990 were obtained from 1:250,000 FSI forest vegetation maps produced from interpretation of 1987, 1989 and 1991 imagery.

(b) Though tea and coffee plantations are clubbed together, area under tea is not significant. Source: Menon and Bawa (1998).

unit of area for development. At least in Karnataka, watershed development projects seek to improve all types of lands, both government and private, cultivated and uncultivated. It is not a mere soil and water conservation or forestry programme, but a strategy to increase the overall productivity of the region as a whole.

Karnataka launched the district watershed development programme (DWDP) in 19 selected watersheds, one in each district from 1983-84 onwards. In addition, there are programmes as under national watershed development projects for rainfed Areas (NWDPA), a model watershed development programme sponsored by ICAR/CRIDA, projects under rain-gauge stations, also an NGO sponsored programme like the PIDOW project in Gulbarga district. The agency, the approaches and manners of implementation of the projects differ. A unique feature of DWDP is that it is managed by a single agency – the dryland development boards, where all the concerned departments of the government are represented so as to promote integration and co-ordination. Until recently, the government sponsored watershed development projects followed a top-down approach, but people's participation is now being emphasised.

Starting from 1984, around one lakh hectares of rainfed areas have been treated every year under the programme, the cumulative total up to 1997 being 14.41 lakh hectares. The average cost of treatment per hectare worked out to be only Rs 2,825 (State Watershed Cell, 1997). The area treated so far (up to 1997) under watershed development programmes (excluding areas treated under earlier soil conservation programmes) works out to be only 7.5 per cent of the total geographical area of the state. But this is still significant considering that it is confined to dry and semi-arid tracts (which constitute about two-thirds of the total area of the state). However, there is still a lot more area to be covered.

A recent evaluation study of 20 watersheds in Karnataka based on satellite remote sensing techniques has shown some encouraging and at the same time some disturbing findings [RRSSC-STDP 1998]. The study involved a comparison between 1988 and 1996 imageries. In most of the treated watersheds, there was an improvement in agriculture, horticulture and forestry sectors; increase in irrigated area and water bodies; increase in yields; and decrease in fallows and extent of wastelands. Gullies and ravines were treated with vegetative checks to arrest soil erosion. Afforestation and gap filling activities increased biomass output as well. The

overall improvements were rated among the 20 watersheds as ranging from 7 to 27 per cent. There were also a few worrisome things like encroachments into non-arable lands, illicit cutting and unregulated grazing there. Even if non-arable areas are brought under forest cover, there was no assurance that it would remain there since people's participation and commitment in the use and management of common or public lands was not forthcoming to the desired extent. A similar need was felt in the maintenance and protection of development works undertaken. Frequent transfers, untimely release of funds and inadequacy of funds also affected the programme.

Other studies of the impact of watershed development on crop yields, income, employment, stability of yields, and water tables have shown significantly positive results [Deshpande and Nikumbh 1993; Ninan and Lakshminanthamma 1994; Lakshminanthamma 1997]. An economic analysis of a watershed (Mitternari) showed that after deducting all the costs including public capital investment and opportunity cost (due to grazing opportunity foregone by people as a result of the project), the internal rate of return was found to be 13.5 per cent, which is encouraging [Ninan and Lakshminanthamma 1998]. We do not have to compare this with high nominal rates of interest; since the cash flows were in real terms. They can be compared with real rates of interest of 5 or even 8 per cent quite favourably. Besides, the benefits taken here include only the increased production in agriculture and the forestry sector, and indirect environmental benefits are ignored. If they are valued and taken note of, the rate of return would be higher still. It was also found that small farmers have shared in the gains. The lack of effective participation of people in watershed development has, however, been a constraining institutional factor in government sponsored projects. Efforts are being made now to give more voice to local level people's groups and NGOs in watershed development.

IV Livestock and Fisheries

Almost all families living in rural areas depend directly or indirectly on livestock resources for their living. There exist strong complementarities between livestock and crop husbandry. Though in terms of value added by livestock, its contribution to national and state domestic product is now about 8 per cent and 6 per cent respectively, its economic importance is far greater than what is indicated by these figures. It is still a significant source of draught power, and

organic manure obtained from this source is needed as a supplement to chemical fertilisers. The contribution of livestock sector to total agricultural inputs, however, has been declining since the last two decades or more, thanks to subsidised chemical fertilisers and tractorisation.

The livestock population, however, has continued to increase both in Karnataka and the country as a whole, though not sharply. Total livestock (covered by livestock census, excluding poultry) increased by 32.3 per cent in India and by only 12.2

per cent in Karnataka between 1961 and 1990. Though Karnataka accounts for 6.2 per cent of the total area of the country, its share in the livestock population of the country was only 5.2 per cent in 1990. There is thus a little less pressure of livestock population on land in Karnataka than in the country as a whole. The density of livestock per hectare of land taking only forests, agricultural land including current fallows, pastures, cultivable waste and other fallows, was only 1.38 in Karnataka in 1990 (14th livestock census) whereas it was 1.71 in India as a whole.

The population of sheep and goats is 37 per cent of total livestock in Karnataka, which is slightly more than 35 per cent for India as per the latest livestock census (14th). The population of sheep actually declined slightly (by 8 per cent) in absolute terms in Karnataka between 1960 and 1990, but the population of goats increased by 34.3 per cent, which was much more than the rate of growth in total livestock (viz., 12.2 per cent) noted above. The role of goats as a source of milk has declined relatively sharply; they are used mainly as a source of meat.

Growth in milk production has been much more spectacular than growth in the number of female bovines. The latter (over 3 years of age) increased only by 26.1 per cent between 1961 and 1990 in Karnataka, while production of milk increased by a phenomenal 160 per cent between 1976-77 and 1995-96. Cows accounted for 54.9 per cent of total milk production in 1995-96 (indigenous cows 35.4 per cent and crossbred cows 19.5 per cent), and buffaloes contributed 44.76 per cent. The share of goats is a negligible 5 per cent [GOK 1995-96]. The present per capita per day availability of milk at 192 grams, though higher than earlier, is still lower than the ICMR norm of 250 grams. Much of the increase in milk production has been achieved through a push to commercialisation of the dairy sector, involving a shift from CPRs as a source of fodder to crop residues and commercial fodder and feeds. The role of CPRs in animal husbandry remains important mainly for the poor and for indigenous cattle and small ruminants.

The growth of poultry has been more spectacular than that of livestock, but less so in Karnataka than in India. The total number of poultry increased by 77.4 per cent in Karnataka between 1961 and 1990, and by 141 per cent in the country as a whole.

Livestock pressure on land has been a traditional source of worry to environmentalists and foresters in India. Forest

policy in India since its early days has sought to regulate this pressure. There is evidence of such pressure having an adverse effect on regeneration capacity and composition of forests, as seen from a case study in Haliyal division (Uttara Kannada) in Karnataka [Rai 1985]. While livestock is allowed to grow, and is promoted even in poverty alleviation schemes, pastures and other common lands to support them are shrinking as noted above. Northern Maidan seems to be facing this problem more acutely than other regions as seen from an analysis of village grazing lands in Karnataka [Nadkarni 1990]. This is tried to be made good by using crop residues and other commercial fodder. Since cows of local breed and small ruminants continue to depend on common lands, an increase in such livestock may call for some measures for regulating grazing like rotational grazing and for sustainable management of pastures. It is difficult, however, on the whole to establish that either in Karnataka or India, there is overpopulation of livestock. In fact, human population has increased much faster and there has been no serious scientific investigation to support such a generalisation [Mishra 1995:258].

Coming to fisheries, world fisheries are in a state of crisis and India and Karnataka may be no exception. 'Fish have never been more popular as sea food, nor more threatened as marine wildlife... Scientists warn that fish population and marine ecosystems are in serious trouble' [Samudra July 15, 1996:15]. This is because 70 per cent of the world's commercially important marine fish stocks are overexploited, and modern fisheries are enormously destructive. It is estimated that about one-third of their fish catch is wasted. Marine biodiversity is under threat because of them (ibid: 15). Modern technologies, moreover, opened up fishing even during the monsoons, which has led to overexploitation. There have been protests in India against the opening of the fisheries sector to multinationals and foreign vessels [Kurien 1995]. They do not confine to deep sea fishing and intrude into coastal zones reserved for country boats. On the whole, fishery managers are oriented more to maximising commercial exploitation and hardly evolve strategies for sustainable exploitation. Even the regionwise or countrywise data necessary to monitor current exploitation in comparison with sustainable fish catch or with regeneration, are hardly gathered and published. Giving greater scope to country fishermen and preventing or regulating wasteful practices could mean both greater income and

employment to the fishermen and also sustainable exploitation of fisheries.

Fisheries contribute only 71 per cent to state domestic product in India, which is not very different from 77 per cent at the national level. However, it is a source of livelihood to many fishermen particularly in the coastal districts of Uttara Kannada and Dakshina Kannada. Inland fisheries provide seasonal and subsidiary income and employment, but their role also is considerably less in Karnataka than in states like Kerala and West Bengal.

The state has a coastal length of 300 kms, 27,000 sq kms of continental shelf and 87,000 sq kms of exclusive economic zone (EEZ), with about 3.03 lakh marine fishermen living in 202 fishing villages. Marine fish catch increased in the state from 1.61 lakh tonnes in 1980-81 to 2.23 lakh tonnes in 1996-97, an increase of 39 per cent. This can be compared with the estimated total resource potential of 4.25 lakh tonnes per annum in the EEZ and the annual catchable potential at 0-50 fathom depth range is estimated at only 2.7 lakh tonnes. [GOK 1997:10-11]. In the country as a whole also as against the actual level of exploitation of marine fish or 2.71 million tonnes, the potential available for exploitation is 3.92 million tonnes. All of this potential cannot, however, be considered as available for sustainable exploitation. Regrettably, estimates of annual rate of regeneration of marine fish and of what can be considered as sustainable exploitation are not available.

The sources of inland fisheries in Karnataka are 4,695 major tanks, 21,801 minor tanks, 61 reservoirs and around 9,000 kms of rivers and canals. The maximum waterspread area of tanks and reservoirs is about 4.15 and 2.16 lakh hectares respectively [GOK, 1997]. Only 87,675 fishermen are reported to be active in inland fisheries.

Inland fisheries production increased from 46,652 tonnes in 1980-81 to 101,654 tonnes in 1996-97, i.e., by 118 per cent which is much more than the rate of increase in marine fish catch during the same period (viz., 39 per cent). What is remarkable is that this increase has come about in spite of a decline in the number of tanks and shrinkage in their spread. Most of the inland fish is captured and traded in an informal and unorganised way by poor people. Since mechanised trawlers are not used in inland fisheries, the technology used is much more sustainable here. Even then there has been a worry about the survival of river fish such as mahseer, which is hunted for sport by adventure-

seeking rich and not as a source of livelihood.

The state also has about 8,000 hectares of brackish water, out of which 4,200 are estimated to be suitable for aquaculture. Of this, only 1,000 hectares are developed. At present, the average production of culture is around 800 kg per hectare. There seems to be some unutilised potential in brackish water in Karnatak. But this should be done very cautiously, without ever extending brackish water into paddy lands and contaminating ground water. It is necessary to remember that aquaculture has produced high and irrecoverable environmental costs where its expansion has been at the expense of cultivated or cultivable lands by pumping in sea water. In response to a writ petition, the Supreme Court has ordered that no further shrimp or aquaculture farms be permitted, that no groundwater be drawn for aquaculture and that no part of agricultural lands and salt pans be converted to commercial aquaculture farms [Samudra 17, March 1997:37].

V

Mineral Exploitation and Environmental Impact

As observed in the introduction above, it is a difficult task to judge what rate of exploitation of minerals is advisable to take care of the problem of depletion and reconcile the interests of the present generation with those of the future generations. It helps, however, to compare the present rate of exploitation with the reserves still available for exploitation. The number of years for which reserves will last at the present rate of exploitation can be directly computed from the above two. Table 4 here gives this picture about the mineral ores in Karnataka in 1995-96. A few minerals are approaching exhaustion within about a decade, which are chromite and copper (11 years each), and gold (9 years). The position regarding others is more comfortable. A debate is needed about whether it is worthwhile pushing exploitation of the former group of minerals to exhaustion so soon, and whether we are getting corresponding returns from it which justify such exhaustion.

Karnataka is estimated to have 1,092 billion tonnes of granite (including coloured) on site, of which 391 billion tonnes are stated to be recoverable. There is no information on the production or actual exploitation of granite, but 408,583 tonnes were reported to have been exported from Karnataka in 1992-93 (Department of Mines and Geology, GOK). Coloured granites are scarce but no

separate figures could be obtained on their reserves.

Apart from depletion, another problem with mineral ore exploitation is the adverse environmental impact it creates [Saldanha 1987]. This is also a cost to be reckoned while judging the worthwhileness of mineral exploitation. The responsibility of taking precautionary steps to avoid or minimise the impact is on the miners. Mining generally causes deforestation as the miners are most often in forest areas. Not only the mining sites, but also other sites used for dumping waste, constructing roads and colonies for miners and such other uses also take up land and lead to deforestation. Open cast mining also leads to land degradation, silting of reservoirs, tanks and rivers downstream, and landslides. There are other effects like air pollution due to dust and noise pollution, which affects the health of miners. Often the miners work in miserable conditions. Though risk to life may be reduced, risk to limbs and to their health are hardly taken care of. As a result, many workers suffer from serious debilitating diseases within a few years of their joining the mines, and some of them may be compelled to stop work. This is so not only in mineral exploitation but also in granite and other stone quarries. Few labour inspectors ever visit such sites or try to improve the working conditions of miners.

Kudremukh is one of the well known mining sites in Karnataka for extracting and exporting iron ore. Kudremukh Iron Ore Company Limited (KIOCL) was set up in 1976 and started functioning effectively from 1982. The site is estimated to have 700 million tons of weathered ore and 450 million tons of primary ore. It has a lease area of 4,000 hectares, of which 1,452 hectares are now under active mining. The ore to waste ratio is presently 2:1. It has almost all the environmental problems expected in a mining project in a hilly forest area. Heavy rainfall in the area further contributes to soil erosion and siltation washing the dug up soils down the hill. KIOCL, therefore, took up several environmental measures to minimise these problems.⁵ One of the important measures

was to dig trenches around the hills, 10 metres wide and 2 metres deep, at the contours of 1,000, 500 and 200 metres altitude. On the upward side, trees like sisal, eucalyptus, acacia, cassia, mahogany, casuarina were planted. Fast growing trees and grass are also planted in between trenches. Tree belts up to 200 metres were created on either side of the rivers and streams. Two rock-filled dams have been built to prevent mine wash from polluting river Bhadra. A 100 metre high Lakhyda dam has also been built to contain the tailings generated from the project. The company is reported to have won several awards in recognition of the measures taken. It is hoped that other mining companies also take similar measures. The annual ore production now is 7.5 million tonnes per year.

VI

Industrial Pollution

Though policy and legislation for the control of industrial pollution may look stringent on paper, there is many a slip in execution. The implementation of pollution control in the nineties is certainly more effective than in the eighties, and far more so as compared with the seventies. Even then we cannot say that all the pollution standards are followed by all the industries. Even though pollution control boards have the powers to close down offending industries, the action is hesitant and lax particularly because of the fear of causing unemployment and distress.

It would be useful to have some indication of hard figures of how far pollution control laws are put into effect, taking the case of Karnataka. One such indication is how many industrial units have at least set up treatment plants. This can be seen from Table 5.

Though Table 5 relates to treatment plants actually in operation, they may not necessarily be operated all the while. This is done to save energy which is scarce and costly. Even where the industries actually operate the pollution control plants, all of them do not meet the standards prescribed. A recent study comparing pollution control status in Karnataka with Netherlands

TABLE 6. TRENDS OF POLLUTANTS IN RIVERS IN SELECTED LOCATIONS IN KARNATAKA

Rivers/Location	Period	Dissolved Oxygen	Biochemical Oxygen Demand	Total Coliform
Krishna at Tintini Bridge	1979-91	NT	DN	UP
Tungabhadra at Ultanur	1979-91	NT	DN	UP
Bhadra D/S of KIOCL	1979-91	NT	DN	UP
Cauvery at KRS dam (Balamurikshetra)	1980-91	UP	NT	UP
Kabbani	1987-91	NT	UP	UP

Note. NT - No trend in the parameter; UP - upward trend; DN - downward trend.

Source: CPCB Annual Report 1992-93, pp 24-26 (extracted).

showed that though in general the standards were more lax in the former, compliance was also more lax, particularly in respect of small industries [Kuik et al 1997]. What is the regulatory machinery doing about it then?

As per the annual report of Karnataka State Pollution Control Board (KSPCB) for 1995-96 (the latest available at the time of writing), only 97 prosecutions were launched under Water Pollution Act and 40 under the Air Pollution Act since the inception of the board in 1981. These cover the cases of highly polluting and also other industries. The number of industries ordered to be closed down for non-compliance was only 22 till March 1994, which increased to 76 under both Water Pollution Control Act and Air Pollution Control Act together. As a result of stricter implementation of the law among 17 industries identified as highly polluting, the rate of compliance of pollution control is reported to have improved from 27.9 per cent in 1991 to 81.2 per cent in 1996 (as seen from KSPCB annual reports for 1991 and 1996).

The extent of implementation of pollution control is reflected in ambient air and water quality. Illustrative information for Karnataka is presented in Table 6 here for water quality (information on air quality in cities is presented in the next section). It shows deterioration in water quality at all locations in regard to coliform, and either no trend or upward trend for dissolved oxygen, and a mixed picture for biochemical oxygen demand. This is hardly a rosy picture.

A major problem with pollution control boards is inadequate finance and inadequate technical staff to monitor all the industrial units. They also take on the unnecessary burden of giving technical advice or guidance and take the blame if technology suggested does not deliver the goods. There are now consultants available on pollution control implementation who can take over this work, and leave the task of monitoring and taking legal action to KSPCB.

There are still several problem areas in the state due to continued water and air pollution. A few illustrative examples are given here, separately for water and air pollution based on a districtwise report by KSPCB on the status of industrial pollution in Karnataka [KSPCB 1995].

Both rivers and the sea are polluted noticeably in Karnataka and some of the problem spots are identified as Bangalore (Vrishabhavati), Bhadravati, Dandeli, Davanagere, Harihar, Karwar, Kollegal, Kudremukh, Nanjangud, Shimsa and Srirangapatna. We take four examples here:

- (i) pollution generated by a group of industries (including small) in one location;
- (ii) pollution generated by one or two large industrial units;
- (iii) pollution generated by a plantation industry (coffee estates);
- and (iv) marine pollution.

Peenya in Bangalore is one of the biggest industrial areas in Asia, housing many industries of various sizes including small industries. Most of them have no or inadequate treatment facilities, especially for small industries. Some 79 units let out over 5 million litres of effluents per day into the river Vrishabhavati which skirts the city on the western side and then joins Arkavati, which is a tributary of Cauvery. Vrishabhavati was a clean perennial stream only 20 years ago, and now stinks so much that it is a nuisance to neighbouring residents. It was used for recreation (picnics) by city dwellers and fishing by villagers earlier. Now, there is a fear that pollutants reach even aquifers and Cauvery. Most of the layouts near Vrishabhavati have no access to municipal drinking water and have to depend only on ground water. The authorities concerned have shown callous disregard of this problem and have not done anything to reduce the pollution. Some of the pollutants are toxic, including lead. The concentration of lead is assessed to be as high as 7.5 times the pollution standard. Other heavy metals like cadmium, chromium, mercury and nickel are also present. These metals are absorbed by crops and animals and enter food chain [Nag et al 1995].

Bhadravati is a major industrial centre in Karnataka, located on the banks of river Bhadra. There are two major public sector industrial units - Visvesvaraya Iron and Steel and Mysore Paper Mills. Though both have installed pollution treatment plants, they are not able to change the brownish colour of effluents reportedly due to non-availability of viable technology. To make matters worse, sewage water of the town and untreated effluents of smaller industrial units are also let out into the river, making it into a problem area. The air pollution caused by VISL is another dimension of the problem. There are similar water pollution problems in Harihar, Davanagere, and Nanjangud.

Plantation industry can also be a major source of river pollution. The pulp separated from coffee seeds is an organic waste, which is not found suitable for use as a fertiliser and is hence thrown into streams. As a result the BOD level in some of the streams randomly tested was found to be as high as 2,000-4,000 mg/litre as against the permitted standard of 3 mg/litre for drinking water sources.

Compared to other major coastal states, the discharge of industrial and sewage discharges into the coastal waters of Karnataka is not high.⁶ We cannot take comfort from the fact that Andhra Pradesh, Gujarat, Tamil Nadu, Kerala and Maharashtra discharge much more waste than Karnataka. Mangalore and Karwar are two problem areas of marine pollution. Mangalore is fast urbanising and both municipal and industrial effluents are released into the sea, causing both thermal and chemical pollution. Sewage is hardly treated before being released into the sea. Industrial units further compound the problem in a region which is considered ecologically sensitive and fragile. The caustic soda factory in Karwar is a major source of pollution, releasing mercury and chlorine into the environment. Marine pollution, it is feared, may affect both the quality and quantity of fish catch.

The air pollution problem is also illustrated with a few typical examples. The stone crushing industrial units around Bangalore are a significant source of air pollution. The stone dust is known to cause silicosis, a lung related health problem. Most of these units are small and scattered and do not find it viable to install equipment to prevent or at least minimise stone dust. One of the solutions to the problem is to restrain any unit from functioning which is not able to do so. But this means discouraging small units and raises equity issues because other firms causing other forms of pollution are not similarly restrained. A cement factory near Tumkur also is considered a major source of air pollution, affecting crop yields and health of both humans and animals in the area. Though equipment to minimise air pollution is installed, the problem of irregular supply of power and low quality of coal supplied are reported to be coming in the way of effective pollution control. The same problem also arises in Gulbarga district which also has cement manufacturing units.

The state has a significant deficit in power supply. However, power generating projects also create significant environmental problems. Major hydroelectric projects can lead to submergence of forests rich in biodiversity and also of agricultural lands and settlements, raising problems of rehabilitation and resettlement. Hence more attention is given now to thermal power stations. But they also create the problem of fly ash, not only polluting air but also requiring land for depositing fly ash. Raichur Thermal Plant and also the Cogentrix Plant well illustrate this

dilemma. Though both of them have equipment to reduce air pollution, the use of waste ash continues to be a problem. There is need for further research into the use of this because of the fear that the bricks made out of fly ash develop cracks after some time. There is little demand for bricks made of fly ash, and transport costs exacerbate the problem. According to newspaper reports, research has shown some scope for using treated coal ash as fertiliser in cultivated areas. In semi-arid areas, this is reported to be increasing the capacity of the soil to absorb and conserve moisture and increase crop yields. If true, this is a promising breakthrough, illustrating how waste can be converted into an economic good while also solving environmental problems.

VII Urban Environment

Rapid urbanisation in Karnataka, as elsewhere, has accentuated the problems of urban environment on all the three main fronts—water, air, and solid waste. Though the rate of growth of urban population has slowed down as revealed by the 1991 census, the urban environmental deterioration does not appear to have slowed down, thanks to accelerating vehicle population and inability of municipal corporations to cope with environmental problems. The major problem areas of urban environment in Karnataka are Bangalore, Hubli-Dharwar, Mangalore and Bhadravati. Gulbarga is also catching up in this regard. One prominent feature of these problems is that they are not confined to municipal limits and engulf periurban and rural areas as well, affecting not only agricultural lands but also aquifers contaminating the only source of drinking water (viz. groundwater) in such areas. We briefly present these problems—water, air and solid waste. There are other problems also like sanitation particularly in slum areas and traffic congestion, which are not dealt with here.

Karnataka has 172 corporations and municipalities of which 139 have no underground drainage and not even primary treatment plants. Among the remaining 33 municipalities, 26 have functional underground drainage facilities and only 15 have primary treatment plants [Saldanha 1992]. The bulk of the sewage water is let out on land or into streams without any treatment, polluting drinking water sources. The perception that water is scarce is yet to take hold both among the city dwellers and their representatives in municipalities and the bureaucrats manning them.

Bangalore which had a population of 4.13 million in 1991 and 4.85 million in 1995 (estimated), receives 705 million litres per day (MLD) of fresh water or 145 litres per day per capita. The supply position is much better now compared with per capita per day supply of 71 litres in 1961 and 102 litres in 1981, though this is less than the prescribed norm of 200 litres per day per capita for Class I cities as per international standards. The total sewage flow was estimated at 438 MLD (62 per cent of water received).⁷ The water supply as given above does not include ground water exploited. Similarly, sewage put into soak pits also is not included in the sewage flow as given above. The Bangalore Water Supply and Sewage Board (BWSSB) was established in 1964 which is responsible for both water supply and sewage disposal and treatment. The main city, though not the outskirts, had a fairly well managed sewage system installed in 1950s, which has now become worn out and damaged in several places. The abuse of sewers by dumping solid waste has exasperated the problem. There are three sewage treatment plants, which are being upgraded. Their combined treatment capacity is only 346 MLD (79 per cent of sewage flow), which is being expanded to 458 MLD. The latter is slightly above the present sewage flow. There are facilities for both primary and secondary treatment. The sludge removed from the primary and secondary clarifiers is used as fertiliser and brings some revenue to BWSSB (Rs 1.04 lakh in 1994-95). There are plants to set up tertiary treatment whereby the treated water can be recycled for industrial use. The outskirts of the city and slum areas do not have satisfactory sewage system, though the main city also has problems, particularly mixing up of storm water drains and sewage lines.

The situation is even more dismal in other cities and towns. Mysore gets 112.45 MLD (as in 1997) or 148 per capita per day. It is reported to generate 35.65 MLD of sewage,⁸ only 31.7 per cent of which is treated and that too at the primary level. Both the treated and untreated wastes are discharged on land, to keep the river Cauvery from being polluted. In the twin city of Hubli-Dharwad, the water supply is 85.35 MLD, which is 119 litres per day per capita. It generates 82 MLD of sewage. The city is yet to establish proper treatment plants, and a part of the untreated sewage is treated as fertiliser and a part let out into streams and tanks. This may have affected the quality of groundwater.

Since small industries discharge their waste water into municipal sewage or drains, it aggravates the problem of waste

water treatment. The municipalities have the burden of cleaning it up. They can charge a user fee for this service to small industries, and improve their financial resources to effectively treat waste water.

The quality of air in most of our towns and cities has worsened significantly in the last two decades mainly due to vehicular emissions. In cities like Bhadravati, industrial pollution is also an additional factor. Both Bangalore and Mysore are covered under the national ambient air quality monitoring programme. The main pollutants monitored under the programme are suspended particulate matter (SPM), sulphur dioxide and oxides of nitrogen. Bangalore has shown higher levels of SPM than standards prescribed during peak hours, though on average it is close to maximum permitted limit. (A major problem in assessing these figures is the large variation in readings both over space and time.) Only three spots in Bangalore are monitored—Anand Rao Circle, Amco Batteries, and Graphite India, but other spots are also emerging as highly polluted (e.g. Richmond Circle, Sirsi Circle, and Chord Road in Vijayanagar). Average SPM levels at Anand Rao Circle are above permitted levels. Even by the end of 1980s, an area as large as 21 sq kms in the central and south central region of the study was found to have air pollutants above limits permitted for residential areas [IISc 1990]. The situation must have worsened today both in intensity and area covered.

An indication of the impact of air pollution in Bangalore comes from a paper presented at a conference in Bangalore in December 1998 by C Rajashekara Murthy, which showed that blood samples of Bangaloreans had a lead concentration of 20 micrograms per decilitre, which is twice the permitted levels. Lead in blood beyond certain levels is feared as leading to brain damage. Another paper by H Paramesh at the same conference showed that the incidence of asthma in Bangalore among school children in the age-group of 6 to 15 years was as high as 24.5 per cent, which is attributed mainly to the air pollution (*Deccan Herald*, December 14, 1998, p.4). Regrettably, similar information on other cities is not available.

Several suggestions have been made to reduce air pollution in cities—better traffic management to relieve congestion, including more roads and flyovers, stricter implementation of emission standards on vehicles, phasing out leaded petrol by the year 2005, replacement of two-stroke engines by four-stroke engines, and prohibition on diesel based passenger cars.⁹

Solid waste is not only a nuisance

aesthetically but also a serious health hazard. It increases rat population and spreads disease. When dry waste is not collected, it is burnt by neighbourhood people in unscientific ways releasing a lot of smoke and toxic gases in the air. Hospital waste is a particularly serious health hazard, since crows and other birds scatter the waste from the dumped sites. There have been newspaper reports that used syringes and other gadgets are recycled by unscrupulous traders.

It is estimated that generation of solid waste in major cities is around 50 kg per capita per day. The solid waste generated in Bangalore is upwards of 2,180 tonnes per day. About 8,000 workers are employed by the corporation and 5,000 more by private contractors to collect and dispose of the waste. There are about 12,500 garbage bins and 2,000 more are being added. The collection of waste is almost absent in outskirts and slums though the corporation levies all the charges – property taxes and betterment levies – on the outskirts.

The incompetence of the corporation has induced several voluntary efforts at waste collection in neighbourhood areas, backed by financial contribution and sometimes organisational help of NGOs. In such areas, the citizens are persuaded to separate dry waste from organic waste and hand them over in separate bags to the boys who come to collect the waste. But the boys have often to separate the waste themselves, for which they are provided with hand gloves. (Such voluntary efforts however are yet to spread, because of the general feeling that when citizens pay property taxes to the municipal corporation, the corporation should exercise this responsibility.) The organic waste is composted by the voluntary groups which partly finances their endeavour.

The corporation also uses organic waste for composting. But only 80 tonnes of waste per day is treated this way. The corporation no longer has landfill sites to dump waste and has to find other ways of waste disposal. Other cities also are facing similar problems. Mysore is estimated to generate about 295 tonnes of waste per day (about 0.39 kg per capita), while Hubli-Dharwar generates about 215 tonnes per day (0.3 kg per capita). The problems of Bangalore are thus much bigger both in terms of per capita waste and total waste generated. But the other cities have not created the same facility for recycling (like converting organic waste into compost) as Bangalore. There should also be concerted efforts to reduce per capita waste generated, such as discouraging plastic bags, throw-away cans

and cups, and recycling packaging material.

Hospital waste is becoming a serious problem in cities. Let alone small nursing homes, even bigger hospitals dump waste untreated. Instead of acting as healing centres, hospitals themselves become a source of disease. Bangalore alone is estimated to generate 1,400 kgs of medical waste everyday. The corporation workers handle this waste without the protection of gloves and proper shoes. A mechanism is urgently needed for collecting this waste separately from other waste and from all hospitals, nursing homes and clinics and incinerating them scientifically and letting off burnt air and gases through high chimneys. This waste should not enter organic waste used for composting.

VIII Concluding Observations

Apathy of the government machinery towards environmental problems faced by people has since long provoked several popular movements in Karnataka. Two types of movements could be discerned: (a) those involving livelihood issues linked to people's access to natural resources; and (b) those involving health concerns, combined also with aesthetic considerations.

A major example of the former is Kustoor Satyagraha and the struggle of the Samaj Parivartan Samudaya against taking over of common property resources like grazing lands for planting commercial species required by industries. The opposition to planting of commercial species in the name of social forestry led to a significant change of policy. The earlier bureaucratic approach gave way to involving people in managing 'waste lands' or grazing lands and in reforesting them with mixed species which people desired. Other examples are protests by fishermen and other local people against marine pollution by Caustic Soda Factory and MRPL pipeline, protests against development projects in ecologically fragile areas such as in the western ghats and the coastal district of Dakshina Kannada. Such projects could deprive the local people of their access to forests, their paddy lands and arecanut gardens, apart from affecting drinking water in some cases. Shivaram Karanth, one of the most eminent writers in Kannada, was in the forefront of some of these movements, particularly in rallying people against the Kaiga Nuclear Power Plant in an ecologically fragile region of Uttara Kannada. SPS led a struggle against river pollution by Harihar Polyfibres.

An example of the second type of popular protest is the struggle against a further

denotification of 30 acres of what has remained of the well known Cubbon Park in Bangalore, an important lung space for the city. It forced the 92 year old Justice Nittur Srinivasa Rao to join the protest in the street, in which he was accompanied also by eminent persons like Girish Karnad. Even DM Nanjundappa, deputy chairman of the state planning board, issued a public statement against the denotification. This protest succeeded in making the state government withdraw the denotification. There were similar protests against the construction of a film complex at Sankey Tank in Bangalore, which would have destroyed many trees and habitat of birds in the city.

There have also been constructive movements like the voluntary efforts at waste collection and recycling in Bangalore referred to above, which, however, are yet to spread wider.

While popular movements can force government machinery to shake off its apathy and also make people environment conscious, they are not by themselves a solution to environmental problems. Their major limitation is that it takes time to organise them and the damage may be done in the meanwhile, though some of them emerged quickly enough to stall official moves as in the case of Cubbon Park and Sankey Tank. Such organisation may be more difficult in rural areas with scattered villages. It is necessary to take care of environmental problems on a more institutionalised, regular, automatic basis instead of relying on occasional knee-jerk reactions. Tightening up of environmental legislation and its stricter implementation is called for, combined with economic disincentives and incentives to make compliance more automatic. A wider sensitisation to environmental concerns is also necessary among city dwellers, medical personnel, municipal councillors, government officials and political leaders, more than among the rural masses.

Notes

[This paper is prepared by M V Nadkarni for Ecological Economic Unit, Institute for Social and Economic Change (ISEC), Bangalore, making use of inputs from Sharachandra Lele, K N Ninan, Syed Ajmal Pasha, B G Kulkarni, G S Sastry, Ramakrushna Panigrahi and S Manasi of Ecological Economics Unit. This is part of a more comprehensive Karnataka Development Report 1999 (in progress) initiated by P V Shenoi at ISEC.]

- 1 The issue of water management and irrigation is tackled in a separate chapter of the Karnataka Development Report 1999 (in progress) at ISEC.
- 2 Between 1987 and 1997, 63,071 hectares were afforested in the state (which is only a little over 2 per cent of area under forests as per

- official land use data). Of this, the bulk of 36,477 were afforested by Karnataka forest department, 10,371 hectares under joint forest management (1992 to March 1998), 7,989 hectares by Mysore Paper Mills, 5,513 hectares by Karnataka Cashew Development Corporation, 1,889 hectares by Karnataka Forest Development Corporation and 833 by Dryland Development Board (which co-ordinates and undertakes watershed development projects).
- 3 Though reservation for women and scheduled castes and tribes is provided for in the constitution of village forest committees, caste rivalries can pose a problem. Moreover, even farmers with exclusive access rights on forests under traditional institutional systems like 'haanes' and 'bettas' have the same access and rights to forests under VFCs. This can create bitterness and conflict. The JFM structure is unable to distinguish between sections with different levels of dependence on the forests.
 - 4 Under the erstwhile princely state of Mysore, there was a network of pasture lands ('kavals') maintained particularly to promote a species of bullocks (Ainruhi Mahal) prized highly for sturdiness and draught power. They were administered by the animal husbandry department. Many of these kavals have now remained only in name, being heavily encroached upon.
 - 5 The measures stated in the text were as reported by KIOCL officials, and as published in their brochures.
 - 6 In million litres per day, the waste water discharged into the sea in descending order of the states is as follows: Andhra Pradesh - 2,466 (of which 2,116 are from aquaculture), Gujarat - 566; Tamil Nadu - 378; Kerala - 151, Maharashtra - 80; Karnataka - 43; West Bengal - 22, Goa - 12; Pondicherry - 6, Orissa - 1 (Source: Central Pollution Control Board, as published in CSO 1997).
 - 7 This seems to be an underestimate since about 80 per cent of water received is expected to flow into sewage.
 - 8 See note 7 which is applicable here too.
 - 9 Diesel is significantly subsidised and produces more carbon monoxide. While there may be some justification for diesel-based heavy public transport on social grounds, there is none for light motor vehicles.

For the Attention of Subscribers and Subscription Agencies Outside India

It has come to our notice that a large number of subscriptions to the *EPW* from outside the country together with the subscription payments sent to supposed subscription agents in India have not been forwarded to us.

We wish to point out to subscribers and subscription agencies outside India that all foreign subscriptions, together with the appropriate remittances, must be forwarded to us and not to unauthorised third parties in India.

We take no responsibility whatsoever in respect of subscriptions not registered with us.

MANAGER

Reaping the Whirlwind

Nizam and the Khilafat Movement

Margrit Pernau-Reifeld

Around 1918 the Nizam of Hyderabad, urgently needing support for his efforts to resist British overlordship, cultivated contacts with the north Indian leaders of the Khilafat movement. What the prince did not bargain for was the eventual spill-over into his state of the populism – anathema to him – of the national movement, in which the Khilafat movement had merged.

THE princely states of India have often been characterised by their 'fly-in-amber-quality' [Jeffrey 1978], a beautiful image indicating that their internal structure was frozen long ago, perhaps with the advent of the British, perhaps even before that. Like a showpiece in a museum, they embodied the past and had no living relation to the present. Rather than as a depiction of reality, however, this image should be seen within the framework of the 'Ideologies of the Raj' [Metcalf 1995]. The states, like the villages, were supposed to constitute the real India, the 'Indian India', fundamentally different from British institutions and ideas, eternal and unchanging.

Thomas Metcalf has shown how this creation of a difference came to gain precedence over the original liberal notion of fundamental equality and how it pervaded the relationship between the colonial power and the colonised in the 19th century. This difference was not neutral; it implied Indian inferiority. Carefully preserved, the princely states were nevertheless held to embody the dangers of oriental despotism. The British never tired of pointing out how easily the native rulers succumbed to the urge to abuse power and revert to unchecked autocracy unless held back by the strong hand of the Resident, thereby providing a living illustration of the need for continued imperial rule.

At the same time – and it is important not to separate these two strands of argumentation – the states had become the focal point of orientalist legitimisation of government. Not only were the princes the 'natural leaders' par excellence; they were thought to provide for the emotional wants and needs of the people through their style of governance in a way the British themselves could never hope to do.

"But, if western influences are less in evidence in Indian India than in the India of the British, there is much to relieve the monotony of life in an Indian state. Even to watch your Maharaja riding on an elephant through the bazar is more

entertaining than the sight of a pale-faced collector in his car" [Barton 1934].¹

Any change in the princely states, even the recognition that change had taken place, that it was perpetually taking place, endangered this quality of 'eternal Indian-ness', a fiction the British and the princes were both keen to preserve. In the 20th century the states were much less isolated from the changes taking place in British India than is commonly supposed, and their involvement was in no respect limited to the discussions of the Chamber of Princes and the Round Table Conferences, which have received ample attention from historians [Ramusaek 1978, Ashton 1982, Copland 1997]. The study of the Khilafat movement in Hyderabad² – a movement strangely out of sync with the fly-in-amber quality and therefore largely ignored – allows for two interesting observations.

(1) The fly was not separated from its surroundings by walls of amber. If (to change the metaphor) we compare politics to a game of chess, Hyderabad politics and British Indian politics were played on different boards, but largely by the same players, and a gain of position in one of the games affected the other one as well. Power was convertible: strong allies in British India affected the position of the Nizam vis-a-vis the British and his own nobles; internal policies in Hyderabad might make it worthwhile for British Indian politicians to woo him further or, on the contrary, might dampen their interest in an alliance. Some of the moves the Nizam made on the British Indian chessboard can be understood only in relation to the meaning they had in Hyderabad; on the other hand actions in Hyderabad – both by the ruler and the colonial power – were more often than not taken with an eye to British India.

(2) The fly was very much alive and moving. Between 1914 and 1921 the Nizam was offered the position of the leader of the Indian Muslims both by the British and by members of the British Indian Khilafat movement. This standing was a new source of legitimisation and

thereby of power. Mir Osman Ali Khan, the seventh Nizam thought it possible to use it in addition to the traditional ideology, which was based on patrimonialism.³ But as in a game of chess the move of a single figure affects the positions and values of all the others, this new source of legitimisation, founded on the leadership of a popular movement, could not be used without changing the whole system. The system did change.

I The Indirect Rule System

The relationship between the Nizams of Hyderabad and the British was based primarily on the treaties of 1798 and 1800, whose function at the time had been to found and stabilise a military alliance between two independent powers of different strength. Though never repudiated, these treaties very soon ceased to reflect the political reality. But insofar as the standing of a collaborating elite depended not only on its acting in accordance with the interests of the colonial overlord but also on the power it could command vis-a-vis its clients and subjects [Robinson 1986], both the British and the ruler had an interest, in the ordinary course of events, to hide the actual extent of the subordination to which the states were being submitted. The treaties allowed, by their very existence rather than by virtue of their contents, recourse to the fiction of a relationship based on the mutual consent of free partners.

More important for the actual relations were the rules and regulations which evolved from precedents and the general clause that conferred on the colonial power the duty to prevent misrule in any part of the subcontinent and the right to take the necessary action. Not a clear-cut vassality but a vague submission of the Nizam to the British Crown, not suzerainty but a paramountcy which escaped all definition other than the ominous dictum of the Butler Report that paramountcy must remain paramount, were the essence of indirect rule.⁴ The result was a very flexible system,

which permitted non-intervention whenever the British did not want to intervene but made reversion to a much stricter system of control possible when they thought the need arose.

In Hyderabad, the approbation of the colonial power via the Resident was necessary not only for the succession to the Nizam's throne but, at least since the time of Sir Salar Jung I, for the appointment of a prime minister. This increased the dependence of state policy on the colonial power as it was much easier to remove a recalcitrant minister than a ruler protected by treaties. Moreover it created a permanent source of friction between the Nizam and his minister, a friction which allowed the Resident to step in and mediate whenever he chose to.⁵ Together with the 'leading' of some senior British administrators, ostensibly to ensure the upkeep of the standards of administration in the key areas of finance, revenue and police, this proved the main prop of British power in the years preceding the first world war.

With the outbreak of the war, however, the British shifted their priorities. The military and financial support the Nizam could extend to the war effort and his supposed stand as the leader of the princes and the Muslims were now deemed important for the interests of the empire as a whole. When, therefore, Mir Osman Ali Khan proposed in November 1914 to dismiss his prime minister – Salar Jung III, grandson of the famous minister – the British acquiesced and renounced, for the first time in over a century, to their claim to have a successor appointed immediately.⁶ Faridoon Mulk, a Parsi gentleman who was known for his administrative skills as well as the ability to steer clear of conflicts between rival parties⁷ and who had already been responsible, during Salar Jung's prime ministership, for most of the daily administrative work, was confirmed in his responsibilities. The 'lent' officers, too, retained their posts. Naturally enough, the Nizam resented this check on his power.

In February and March 1918, Mir Osman Ali went on a trip of some weeks to Delhi, Aligarh and Bombay. As soon as he returned, he dismissed all his British advisers without previous warning, and when urgently summoned to an interview with Resident Stuart Fraser insisted on his treaty rights to do so.⁸ While declining to enter the field of treaty rights, Stuart insisted that it had long been customary for the British to be consulted in everything that concerned the lent officers, and that "friendly custom was a thing apart from treaty".⁹ If the Nizam insisted on the

dismissals, the British would have to interpret this as an unfriendly act, apt to raise doubts on his loyalty. Mir Osman Ali understood the hidden threat and reinstalled his 'advisers'.

Without even considering whether the Nizam's aggressiveness was politically motivated, the British put it down to the influence of flatterers and bad advisers. "The Nizam, it seems, has behaved like a naughty child who away from his nurse at a party has had his head turned and gone back home full of foolish ideas, determined to assert his independence – only to sober down and repent of his outburst on again coming under the influence of his mentor. We should, I think, leave the nurse to deal with the child."¹⁰ More than treaties and usage, this imagery of the child ruler and the Resident as his fatherly friend decisively shaped the relations between a prince and the paramount power. It takes more political skill to decline the 'help' of a powerful friend than to argue on legal delimitations of reciprocal rights and obligations.

Mir Osman Ali, however, was no longer ready to act according to this script. Instead of submitting, he attacked the conduct of the Resident, calling it undue interference in the internal affairs of his state. The British, on their part, came to the conclusion that they had reached a point at which the continuation of non-interference might well endanger the whole structure of indirect rule – which, although 'indirect', was nevertheless always meant to be 'rule'. The war being almost over, the British could safely opt for more formal ways of control – either a return to the system of the dual head of administration through the appointment of a minister or the establishment of an executive council in whose constitution and composition they would have a leading say.

This was the situation at the eve of the Khalifat movement. The Nizam stood in urgent need of allies. He certainly could not find them among the old nobility of his state – some of whom would have preferred the rule of his half-brother Salabat Jali and had perhaps even been involved in an intrigue to effect a change of rulers,¹¹ while others deeply resented his continuous interference in their financial affairs.¹² In some other situation, the classical expedient of elevating newcomers and ruling through them would have been enough, but under the given circumstances newcomers could not wield sufficient power to enable the Nizam to resist the colonial power. The 'check to the king' could not be countered on the Hyderabad chess-board. Mir Osman Ali had to look to the

British Indian game for new figures and resources.

II Indian Muslims' Leader?

To understand the emergence of the Nizam as the leader of the Indian Muslims, it is necessary to move back in time to the beginning of the world war. When it seemed likely in August 1914 that the Ottoman empire would side with Britain's enemies, the British were worried because of the possibility of a general flaring up of pro-Turkish sentiments in India. They were even more afraid of the possibility of their losing the loyalty of the army, which had an important contingent of Muslims. Hoping that the word of the Nizam as the greatest Muslim ruler of the subcontinent would carry weight with his brothers in faith, the viceroy appealed to him:

"I accordingly call upon Your Highness to stand forth as the spokesman and leader of the Mahomedans in India and to declare that England's cause is both right and just."¹³

The Nizam hesitated. On the one hand, the offer greatly enhanced his position vis-a-vis not only his countrymen but also the colonial power, and Mir Osman Ali would have been the last person to refuse additional power. On the other hand, he had to keep in mind the internal situation of the Hyderabad state: the Arab soldiers and radical Muslims who had caused much unrest in the capital city when the reference to the Turkish sultan had been omitted during Friday prayers in the great mosque would surely not take kindly to his siding with the khalifa's enemies.¹⁴ It took all the persuasive powers of the Resident to make the Nizam issue a manifesto rejecting the idea that the conflict between Great Britain and the Ottoman empire was a holy war:

"I repeat and reiterate that in the crisis before us the Muhammedan inhabitants of India, especially the subjects of this state should, if they care for their own welfare and prosperity, remain firm and whole-hearted in their loyalty and obedience, swerve not a hair's breadth from their devotion, to the British government, whose cause I am convinced is just and right; keep sacred the ties which bind the subject people to their rulers; and lastly, that they should in no case allow themselves to be beguiled by the wiles of anyone into a cause of open or secret sedition against the British government."¹⁵

In acknowledgement of this declaration and of his financial help during the war, Mir Osman Ali was awarded the traditional

title of 'Faithful Ally of the British Government' in 1917, and in January 1918 he became 'His Exalted Highness',¹⁶ a title which granted him an exceptional position of precedence among the Indian princes, none of whom was more than a simple 'His Highness'. This precedence made it easier for him to argue that Hyderabad should not be subjected to the exercise of paramountcy on a par with the other states. At the same time these titles implied in express terms a renewal of the 1914 offer and order to emerge as the leader of the Indian Muslims.

As the Resident observed in his speech on the occasion of the awarding of the title, the fact that the Nizam was the ruler of the greatest Muslim state in India and "the unity of Islam—that catholic tie which creates a bond of brotherhood between Mahomedans wherever they may dwell—have long given the Nizams of Hyderabad an influence among their co-religionists which reaches beyond the border of the premier state... The Nizam with far-seeing realisation alike of the true interests of his co-religionists and of his duty to the king-emperor, was content with no passive role of loyalty but at once boldly stood forth as the leader and spokesman of Mahomedan India".¹⁷

The first months of 1918 witnessed a situation which might appear classic—the colonial power trying to build up a prince as a bulwark against developments in British India which might endanger the empire, the prince looking for means to shake off the British shackles—were it not for the appearance of a third party, also interested in the Nizam's prestige as a Muslim ruler but offering him the role of leader and figurehead of a young Muslim nationalism. It is almost certain that during this trip to Bombay, Delhi and Aligarh the Nizam established contact with some leading figures of what Francis Robinson called the 'Young Party' [Robinson 1974]. Two of them—Zafar Ali Khan, a former classmate of Shaikat Ali, now editor of the influential newspaper *Zamindar* of Lahore [Minault 1982, Hasan 1994] and Zulqader Khan—had long-standing contacts with Hyderabad. Zafar Ali was a former civil servant of Hyderabad; Zulqader Khan, the son of Server ul Mulk, private secretary to the former Nizam, had even been a judge of the Hyderabad High Court.¹⁸

Both these worthies had been expelled from the state in 1909, when the Resident had taken offence to some articles lampooning the then finance minister, Casson Walker.¹⁹ Significantly, immediately after his trip, the Nizam made an effort to bring

them back to Hyderabad but was prevented from doing so by the British.²⁰ Nevertheless, he kept in contact with them through Abdullah Khan Khasmandi.²¹

The first result of these new connections was a press campaign in north India, probably engineered by Zafar Ali and partly paid for by the Nizam.²² The topics covered were those close to Mir Osman Ali's heart: the rending of the province of Berar and indignation against the practice of forcing lent officers on the state and the autocratic powers of the Resident. More important, however, were: one, a plea for the conferring of the titles of 'King of Hyderabad' and 'His Majesty' on the Nizam (which would put him almost on a par with the king-emperor) not as a recompense for services rendered or in recognition of his premier position among the princes but as a special boon to the Muslim community of India;²³ and two, the conferment of the title of 'Mohi ul Millat wad Din' (Reviver of the community and the faith) on the Nizam by the 'UP Muslim Defence Association' in October 1918.²⁴

Already, in June 1918, the Amritsar-based newspaper *Vakil* had claimed that "thanks to the present Nizam... the signs of improvement are visible in the spiritual and moral life of Muhammedans, and their condition is gradually regenerated. It is, therefore, their duty to offer him the title (literally gift) of Muhi ul Millat wad Din".²⁵ About a month later, 'Sitara-e-Hind' suggested that the ulema of India "should be invited to the next annual meeting of the Nadwat and that they should formally propose the bestowal of the title Muhi ul Millat or Muin ul Millat wad Din".²⁶ The importance of this title of course lies in the fact that it enabled the Nizam to base his claim to speak for all the Muslims not on a British instruction, as hitherto, but on the popular opinion of north India. Not only was the Nizam freed from the odium attached to a collaborator; he could even redefine his position in a way to serve not the needs of the British, as hitherto, but his own.

Even after it is granted that the Nizam had an interest in cultivating the contact with Zafar Ali Khan and through him with Shaikat Ali, the question of what induced the other side to cultivate the alliance remains open.

Notwithstanding the image of splendid princely isolation in the 19th century, Hyderabad had from the beginning been deeply involved in the Aligarh movement. The state and private donors, most prominent among them the Nizam and Salar Jang I, had at times covered up to 30 per cent of the budget of the Aligarh college²⁷

in acknowledgement of which there had been plans to build a museum on the campus named after the Nizam and call the large dining room Salar Manzil.²⁸ Students from Hyderabad had been sent the long way northward to Aligarh and alumni of the college were employed in high posts in the Nizam's administration.

The influence of the government of Hyderabad and the Nizam personally among the trustees of the college had always been high, and most of the men who took a leading part in the politics of the 'old party' were in some way or the other connected with the state of Hyderabad.²⁹ The endeavour of the 'young party' to win the Nizam as their ally might perhaps be seen as one among several moves to grab the reins of power from the old party.³⁰

Secondly, the Nizam still represented an immense source of patronage, providing funds for projects³¹ as well as attractive jobs outside the direct reach of the British Indian administration.³² Moreover, the national movement had not yet begun to turn against the Indian princes in the name of democracy, and the prestige they wielded during the first world war era was still great. For some years—approximately 1918 to 1920—it seemed as if the emerging Khilafat agitation would unite not only Hindus and Muslims but nationalists and princes as well.

III

Khilafat Agitation in State

Within the limits imposed on a 'faithful ally' who could not risk an open breach of this alliance—not yet at any rate—the Nizam tried to impress the requests of the Khilafatists on the colonial power. In March 1920, when the precarious position of the Turkish sultan and khalifa had become apparent, he wrote a long letter warning Lord Chelmsford, the viceroy that owing not only to the influence of the Muslim ulema but also to certain statements by dignitaries of the Church of England, the conflict between the British and the Ottoman empire might become a 'conflict between the Cross and the Crescent within the empire'. In the face of considerable opposition, the Nizam went on, he had done all he could to make the peace celebrations a worthy event. But now it was the turn of the government to accommodate the Indian Muslims in an area in which their indignation was not only dangerous but also unjustified:

"I also think their resentment, which has a strong religious basis, is not less provoked by what they consider will be a breach of faith on the part of the British government

if the pledges given during the war were not fulfilled. No doubt is left of the solemnity of these pledges after what has been authoritatively stated by the premier and other distinguished statesmen in the House of Commons...A combination of religious frenzy and indignation at breach of faith will be of an intensity the evil consequences of which may present a political situation of the gravest possibilities."³³

In spite of the prominence given to these actions of the Nizam in the historiography of Hyderabad, the Khilafat movement in the state was limited neither to the exchange of these diplomatic missives nor to be a spontaneous imitation of events in British India. Once we move beyond the limited area on which the resident reported, however, the material becomes very scanty. Nevertheless, it seems possible to trace some of the lines which link the movement to the political developments of the 19th century.

Hyderabad had a long Wahabbi tradition, which dated back to the 1830s, when a brother of the Nizam was involved in a conspiracy against the British [Regani 1963, 1986]. The Deoband movement was based on support from the princely states to a much lesser extent than Aligarh; nevertheless, as early as 1876 there existed a group of donors in Hyderabad, which formalised into an association in 1895. The members of the association included princely employees, a publisher of religious books and a religious teacher [Metcalf 1982].

At the same time, there must have been a spread of pan-Islamism in the state. The 'khutba', which may be taken as an indicator of change in this field, was read in the name of the Mughul emperor until 1858. After this date, at the instance of the British, it was read in the name of the Nizams themselves. On the eve of the first world war, however, reading the khutba in the name of the Turkish khalifa seems to have been a practice of some standing. The exact date of this second change is not known but it might well be connected with the two years that Jamal ud Din al Afghani spent in Hyderabad after his expulsion from Egypt in 1879 [Keddi 1968].³⁴

Given the scarcity of source material, it is only through biographical material that an insight into the turn-of-the-century political and ideological movements which later merged into the Khilafat agitation is possible. Maulvi Abdul Qayam is found collecting money for the victims of the Balkan war as early as in 1898 and some time later for the Hijaz railway construction fund.³⁵ This tradition was taken up by his

son, Abdul Basith, who took part in the organisation of the Turkish relief fund and was leading the Hyderabad Red Crescent Society in 1912.³⁶ The fact that the Anjuman-i Khuddam-i Kaaba, too, had a branch in Hyderabad³⁷ indicates further that even before the world war and Gandhi's first national campaigns the princely states had become quite permeable to British Indian influence.

Qayam was a close friend of Aghornath Chaitopadhyaya, the father of Sarojini Naidu, who on the invitation of Salar Jang I in 1878 had moved from Bengal to Hyderabad, where he had taken a leading part in the foundation of the Nizam College.³⁸ He and Qayam were among the first members of the Indian National Congress in Hyderabad. Here they were soon joined by Keshavrao Koratkar, lawyer by profession and president of the Arya Samaj since the turn of the century, who supplied contacts to the leading politicians in Maharashtra.³⁹ The Congress, at this stage, proved to be the meeting ground as well for the pan-Islamist ventures as for secular nationalism and for the movements propagating communal consciousness among the Hindus.

Political activity in Hyderabad tended to take the shape of educational ventures. In 1907 the Marathi-speaking community of Hyderabad, which was probably the most politically active part of the country until the late 1930s, decided to found an Anglo-Vernacular High School. Not surprisingly, Keshavrao is to be found in the forefront of this movement. He was seconded by Waman Naik, who donated not only Rs 35,000 for the construction of the school but also land worth another Rs 60,000. The outcome was the Vivek Vardhini High School, which provided the rallying point for the Marathi speakers in the capital city.⁴⁰

Since the beginning of the century, the idea of having an Urdu-medium university had been in the air [Mayhew 1912]. The idea was strongly voiced at the First Education Conference in 1915, where the leading part was again played by Abdul Basith – together with Muhammad Murtuza who had worked with him in the Red Crescent Society and Mir Akbar Ali,⁴¹ another protege of Qayam and editor of the newspaper *Sahifa*⁴² (which was to receive financial assistance in 1918 for carrying out a press campaign in favour of the Nizam and the Khilafat movement). The conference and its organisers received the patronage of Akbar Hydari – then educational secretary of the Nizam, later prime minister of Hyderabad – who was married to a niece of Badruddin Tyabji and who throughout his life cultivated the

contacts to the Bombay financiers of the Congress.⁴³

So now the stage was set for the Khilafat movement. The first meeting took place on March 16, 1920 at the grounds of the Vivek Vardhini High School – the choice of venue already indicating who the supporters were – and assembled about 15,000 persons. Khilafat Day was observed by a hartal in Hyderabad city, in which at least the Muslim shops took part. All the communities joined in a meeting the next day, which boasted 25,000 participants. The meetings were presided over in turn by Waman Naik, Keshavrao, Mir Akbar Ali and one Muhammed Asghar, who had qualified in Oxford for the barrister's calling and to have belonged to the circle round Abdul Basith.⁴⁴ At this stage the Nizam seems to have got the idea that this popular agitation, which he had planned to use for his own aims, might outgrow him and become unmanageable. He therefore issued a firman on April 4, 1920 requiring prior permission for meetings.⁴⁵ Nevertheless, the next three meetings still numbered 10,000 to 12,000 persons each.

The terms of the Peace of Sevres, announced on May 20, reduced the sovereignty of the khalifa to the Turkish heartland of his empire and deprived him of the control of the holy places of the Hijaz. This British had earlier passed this information on to the Nizam together with an invitation to assist them in combating the agitation. Knowing that to decline such an 'invitation' would be as dangerous as to refuse their 'help', the Nizam immediately issued an order forbidding all demonstrations without further ado. A few days later the leadership of the British Indian Khilafat movement resolved on a campaign of non-cooperation, to which Gandhi and his followers agreed shortly afterwards. On the face of it the rupture between the Khilafatists and the Nizam had now become inevitable, and for some time it seemed as if both sides were really bent on this rupture.

What provoked Mir Usman Ali's resistance was not the aims of the movement nor its struggle for the khalifa, nor its anti-British impetus, which weakened the colonial power, but its methods – in which he very rightly saw a possible threat to this own government usurping the resident's prerogative, as it were, the Nizam for once took up the role of adviser and wrote to Lord Chelmsford:

"So long as it [the Khilafat movement] had not passed out of sober reasoning and judicious restraint it was entitled to my sympathy. As a Mussalman ruler it is but natural that I should feel the break-up of a Muhammedan power, but it is impossible

for me to countenance proceedings that have avowed intentions of resistance, euphemistically called 'passive', to British authority – indeed against all authority ... The position, as it strikes me, calls for action in two directions; one is to put down lawlessness or incitement to lawlessness with a strong hand, and the other is publicly to champion the appeal to the Allied Powers... for reducing the severity of the Turkish peace terms."⁴⁶

The leaders of the Khilafat movement, however, took cognisance primarily of the prohibition of meetings in Hyderabad and the sharp condemnation of these methods. Understandably, they reacted with indignation – some of them, however, trying to keep a back door open by attributing the Nizam's move either to British pressure or to the influence of Sir Ali Imam, who in the meantime had been appointed president of the executive council in Hyderabad.⁴⁷ When some north Indian newspapers started wondering aloud whether under these circumstances Mir Osman had not forfeited his right to the title of *Muhi ul Millat wa Din*, Mir Osman answered with an angry firman stating that those who had awarded him the title had not acquired the right to lay down the law for his comportment as the Nizam:

"I am totally at loss to comprehend why others should try to meddle in the affairs of my state, in the best interests of which, both political and general, I deemed it fit to issue prohibitive orders regarding the Khilafat meetings... They must not forget what 'Hafiz' says: 'Politics are best known to the emperors don't worry yourself about them, being but a beggar'.⁴⁸

These certainly were strong words. But throughout his political life the Nizam was known for his occasional outbursts of strong words, not always matched by action. Therefore it is not too surprising that in less than two weeks time this firman should have been followed by another one expressing heartfelt sympathy for the aims of the Khilafat movement, giving an assurance of help and deploring 'the false impression among the Muslims in other parts of India, who thought that I felt no sympathy for the present deplorable condition of the Islamic countries and of the holy places of Islam' when "for reasons of state and in view of political expediency it became necessary for me recently to issue a series of firmans regarding the Khilafat question".⁴⁹

This firman brought an enthusiastic reply from Zafar Ali Khan: "My faith in Your Exalted Highness has remained unshakably firm amid the stress and storm created around your august personality by forces inimical to Islam, and I assure Your Exalted

Highness that Muslim India looks up to you even now as the beacon of Islam in India and trust that you will exert your sovereign influence to bring about a change in Lloyd George's Turkish angle of vision."⁵⁰

Even if the next communication of Zafar Ali became more pressing – urging the Nizam, as it did, to decide "once for all whether Muslims of India... are entitled to approach the Sovereign of Hyderabad in accordance with the constitution of Islam"⁵¹ – the bonds between the Khilafatists and the Nizam did not break definitely. As late as 1921 Shaukat Ali addressed an appeal to the princes, and more specifically to the Nizam, to the effect that he prayed to God that "He may give them courage to co-operate with us, that they may lead us and that we may follow them".⁵² At the same time, Zulqader Khan, by now awarded the title of Zulqader Jang did a stint as home secretary in Hyderabad.⁵³

IV Aftermath of Agitation

Although the Khilafat agitation passed out of the realm of practical politics with Turkey itself divesting the khalifa of his temporal powers in 1922 and abolishing the Khilafat in 1924, it had become too powerful a symbol to lose its attraction for all. The Ali brothers, in particular, continued to search for ways and means to restore the institution, its binding force for the Muslim world, and not least, their once-predominant position.

From 1924 dates a connection between Muhammad Ali and the 'grand mufti' of Jerusalem. After his brother's death in 1930, Shaukat Ali took over and in 1931 organised a 'world Muslim conference in Palestine' [Chawla 1985] with the aim of offering the Khilafat to king Fuad of Egypt – who after favouring the project for a while declined for reasons of internal politics – or restoring it to the former khalifa, Abul Majid.⁵⁴ These preparations were viewed with nervousness by the Turkish government. The British, who wanted neither to risk and open conflict with Turkey nor a rekindling of Muslim agitation in India,⁵⁵ managed to play down the pan-Islamic aspect of the conference and to reduce the agenda to the less contentious issues of the Hijaz railway, the endowment of waqf for the holy cities and the establishment of an Islamic college in Jerusalem.

It is less known, but perhaps not less important, that Shaukat Ali had at the same time tried to link the family of the Nizam to his pan-Islamic ventures. In August 1931 he visited Hyderabad,

ostensibly to collect funds, in reality to act as marriage broker for the alliance of Mir Osman Ali's two sons, then touring Europe, to the daughter and the niece of the former khalifa. Although the Nizam consistently denied that the marriages had pan-Islamic implications, such implications could not have passed unnoticed by him, especially as the son of the heir apparent of Hyderabad would also become the legal heir of the former khalifa and thereby a potential claimant to the 'khilafat'. However, apparently he had no intention of using this new strand of legitimacy in the immediate future.

When Shaukat Ali nevertheless urged Muslims of Bombay to "give princes enthusiastic reception to mark importance of link between Europe and India" and in newspaper articles drew attention to 'khilafatist aspect of alliance', the Nizam reproached him with 'breach of confidence'.⁵⁶ (which at least shows that there had been confidential discussions related to this aspect) and shortly afterwards withdrew his financial support.⁵⁷

On the whole, the Nizam showed himself quite willing to take up the role of leader of the Indian Muslims – offered to him on different occasions and on different conditions, both by the British and by the north Indian 'khilafatists'. The legitimisation of his government implied in the statement that he represented the Muslims and could speak on their behalf as well as the potential for agitation he was convinced he could command from now on came to occupy an important place in his struggle with the colonial power. In the Nizam's mind, however, the use of these patterns of argumentation should and could be limited to his interaction with the British. Never did he realise that these same arguments might provoke a change in the relations between him and his subjects, basing government on the principle of representation of the people and approval by them and acknowledging a right to political participation.

By reaching out for the support of parts of the British Indian national movement, the Nizam transcended Hyderabad as his frame of reference and got involved in a political game whose rules he understood but imperfectly. Originally, he had hoped to borrow some chess figures from the larger board and to move them freely on his own, thereby countering the British 'check to the king'. Soon, however, he had to realise not only that the figures tended to develop a life of their own but that events on the big boards over which he had no control – such as the breaking up of the Hindu-Muslim unity of the Khilafat movement – increasingly impinged on his state.

Perhaps neither the British Indian influence nor the use of populist elements could be avoided in the long run. But by basing his government on the representation and the support of the Muslims who in Hyderabad constituted a minority of not even 20 per cent, the Nizam certainly chose the most dangerous course for his state.

Postscript: It is known that the Nizam entertained the fond hope that the Indian Muslims would come to his aid in his conflict with the government of independent India in 1947-48 over the status of Hyderabad state. What contribution to this hope, if any, was made by the experience of the Khilafat movement and his family's potential claim to a succession to the Khalifat movement and his family's potential claim to a succession to the khalifa will remain a matter of speculation so long as the Nizam's private papers are not opened for research.

Notes

[For their valuable suggestions I should like to thank Dietmar Rothermund, Gail Minault, Narayani Gupta and Mushirul Hassan. Mir and Begum Moazzam Hussain, as always, gave generous encouragement, even where our reading of the past differed.]

1 The fact that Barton, resident in Hyderabad

from 1925 to 1930, was certainly one of the British representative in the 20th century who put up the toughest fights against all forms of 'bad government' gives a certain unintended irony to the quotation.

- 2 Hyderabad, remnant of the Mughal empire in the Dekkhan, had entered into a subsidiary alliance with the East India Company at the end of the 18th century, relinquishing the right to external policy by treaties. The same treaties, however, guaranteed the internal autonomy of the state and the ruler, an autonomy which was successively eroded in the course of the 19th century. The treaties nevertheless were not revoked until 1947. The state was governed by a Muslim ruler and a composite nobility, which was held together by common subscription to the tenets of Moghul-Persian court culture. Mir Osman Ali Khan, the seventh Nizam, had ascended the throne after his father's death in 1911. See Pernau-Reitfeld (1992).
- 3 The concept of patrimonialism is, of course, Max Weber's [Roth and Wittich 1968, 1978]. For an extensive discussion of the notion and the possibility to apply it to the Indian context see Blake (1979 and 1993), Rosel (1985).
- 4 The repeated attempts of the Chamber of Princes to induce the British to define their paramountcy – and thereby limit their possibilities of intervention in the states' internal policies to a clear-cut number of cases – had led to the appointment in 1928 of a committee under Harcourt Butler to inquire into the exact nature of the relations between the states and the British. The disappointment with Butler's final report was one of the reasons

why the rulers opted for an all-India federation at the first round table conference, hoping the federal constitution would bring them the desired definition of paramountcy.

- 5 This is the reason for what Schwerin called the 'the Nizam's proverbial jealousy of his minister' [Schwerin 1980].

NEW FROM SAGE

A NEW MORAL ECONOMY FOR INDIA'S FORESTS?

Discourses of Community and Participation
Edited by **ROGER JEFFERY** and **NANDINI SUNDAR**

Joint Forest Management (JFM) has come to be regarded as being virtually essential for the conservation and regeneration of forest resources in India. However, the existing literature on the subject has been largely celebratory and perhaps inadequately critical. This volume serves as an important and necessary corrective by drawing attention to the various conceptual and empirical problems associated with the approaches to JFM currently prevalent in the country. The contributors highlight the need for greater attention to regional networks of power and resource use. Community participation, they argue, must allow the local populace to choose their own methods of conservation and not degenerate into merely another way of co-opting villagers into the agenda of the state.

POLITICS AND DEVELOPMENT

A Critical Introduction
OLLE TÖRNQUIST

If it's a lucid, concise intellectual history of development theory you're looking for - one with originality and political bite - you'll find it in Törnquist's fine book.

James C Scott,
Yale University

Through a wide-ranging critique of influential conceptualisations of the 'Third World', and by focusing on the symbiosis between politics and development, Törnquist opens the way for a fresh understanding of how late developing societies can be democratised.

Neera Chandhoke,
University of Delhi

- 19 Nor was the Hyderabad involvement limited to purely educational matters. Mehdi Ali Hasan, titled Muhsin ul Mulk, Sayyid Hussain Bilgrami, titled Imad ul Mulk and Mushtaq Hussain, titled Viqar ul Mulk, the leading figures in the Simla deputation of 1906, not only got their titles and substantial income from the Nizam but for years had held important posts in the administration of the state.
- 20 Robinson (1974), chapters 5 and 6.
- 21 His financial contributions had at no time been limited to Aligarh, but besides many other had extended to the colleges of Deoband [Minault, p 221] and Firangi Mahal as well (Hyderabad Affairs 1919, Report Cleveland, Director of Central Intelligence, 24.2.1919, R/1/1/635).
- 22 Among the Muslim politicians of whom Francis Robinson gives a biographical sketch in the appendix to his book (op cit), no less than 16 held appointments in Hyderabad.
- 23 Nizam to the Viceroy, 16.3.1920, MSS Eur/E 264/24 (Chelmsford Collection). See APSCACHFMAP (1966), pp 30-32.
- 24 The impression that al Afghani had only a very limited influence in Hyderabad seems to rest in the main on a communication from Sayyid Hussain Bilgrami to the government of India (ibid, p 23). As al Afghani spent most of his time there in writing polemics against Sayid Ahmad Khan, with whom Bilgrami had a close relation, it need perhaps not be taken at face value. On the other hand, in a letter dating from 1880, instructors from the *Madrassa-e Aizza* in Hyderabad address the pan-Islamist as their teacher (ibid, p 130).

However, more research on the history of Muslim thought in the Deccan in the 19th and 20th centuries still needs to be done, before these suppositions can be substantiated or falsified.

Agricultural Tenancy and Interlinked Transactions – II

Neoclassical and Marxist Approaches

Mamata Swain

This article attempts to study the interlinked land, labour, credit and output contracts observed in Orissa in recent years. The extent of occurrence of these contracts and their modality are analysed. The applicability of the neoclassical and Marxist approaches to interlinkage is examined.

This article appears in two parts. The first part examined the features of tenancy contracts, causes of their incidence and persistence and characteristics of lessors and lessees in the survey area. Tenancy is not an isolated phenomenon. It is to be studied in relation to transactions in other factor markets with which it is very often interlocked. Therefore, this, the second part deals with interlinked tenancy contracts.

I

Introduction

IN underdeveloped rural areas it is very often observed that tenancy contracts are interlocked with transactions in other markets like credit, labour and marketing of crop produce. The implications of interlinking of factor markets and its repercussion on farm economy are viewed differently by the neoclassicals and the Marxists. Bharadwaj (1974), in the Marxist tradition argues that due to the interlinked nature of transactions, the neo-classical individualist market framework is not applicable to the sort of multiple exchanges observed in backward agriculture. And she suggests an alternative classical Marxist framework to explain the interlinked deals in terms of surplus extraction. Bharadwaj (1974:4) notes that "such interlinking of markets increases the exploitative power of the stronger sections because, while there could be limits to exploitation in any one market – due to traditions or conventions – or due to economic factors – the interpenetration of markets allows them to disperse exploitation over the different markets and to phase out exploitation over time as well."

For a neat exposition of Marxist interpretation of interlinkage Bhaduri's (1983a) model of interlinked tenancy and credit contract may be cited. Bhaduri argues that in backward agriculture the market forces are incipient and not adequately developed. This inadequately developed market forms the basis of pre-capitalist or semi-feudalistic exploitation. Bhaduri points out that the involvement of peasants in market transactions is not triggered by the motive of 'gains from trade' but under compulsion of subsistence consumption needs which are to be met by entering into loan transactions with the dominant

party. The simultaneous operation of two methods of surplus extraction in the form of rent as well as usurious extraction tends to increase the total claims on the peasant's produce by the expropriating class. Thus by interlinking the credit and land market, the landowner wields semi-feudalistic power over the tenant and brings the tenant under his perpetual control subjugating him to a kind of serfdom. Thus Bhaduri's view resembles the classical form where the pre-capitalist relations are a direct relationship of domination and subordination between the ruling classes and direct producers unmediated through the market and they are thus characterised by extra-economic coercion.

Bardhan (1984), a noted exponent of the neoclassical approach contradicts Bhaduri's view and emphasises that even though organised markets are not fully developed, economic propositions regarding rural transactions based on market imperfection will not be far from reality. Bardhan asserts that interlinkage reinforces the impact of imperfection in each market. Interlinked personalised transactions by their very nature act as a formidable barrier to entry for third parties and is thus a source of additional monopoly power for the dominant partner in such transactions. Interlinking of transactions in different markets is also a very effective way for the dominant party to avoid social or legal controls or charging high prices if control on prices is not uniform in all markets or prices adjust at different speed in different markets. He emphasises that the neoclassical tools to explain and study the impact of market imperfections can be used to study interlinked transactions in backward agriculture.

In contrast to Bhaduri, Bardhan does not have such a pessimistic view of interlinked contracts. In explaining the existence of

attached labourer arrangement, for example, Bardhan (1984) notes that it is "the employee's need for job security and the employer's need for a dependable and readily available source of labour supply and not feudal subordination that provides the major motivation for a predominantly market relationship between the attached labourer and his master". Thus, the relationship is viewed as symbiotic rather than a dominant-depressed class relationship. With this theoretical underpinning, in the following sections we attempt to analyse the kind of interlinked contracts observed in our study villages to examine the applicability of the neoclassical and the Marxist approach to interlinkage.

II

Interlinked Tenancy and Credit Transactions

The role of tenancy as a credit system, i.e. the landlord providing production loans to the resource poor tenants to undertake cultivation has been emphasised by many starting from classical writers like Smith (1969:490), Turgot to neoclassicists like Marshall (1961:644); Braverman and Stiglitz (1982) and Marx (1974) as well. Also, a tenant receiving consumption loan from the landowner at times of need and thus tenancy acting as an insurance against hunger has been depicted by Scott (1976:46) in his moral economy approach to village production relations.

In our study villages, some of the tenants are found to borrow from their lessors (Table 1). As a result, the land, labour and credit contracts get interlocked. In Charapara a pure tenant has borrowed Rs 1,000 from the landowner to incur expenses on the funeral ceremony of his father. The interest rate charged on the loan is extremely high at 60 per cent per annum and the contract is that the

principal amount along with the interest will be repaid in terms of labour on the lessor's field. Usually when a loan is repaid in terms of labour the wage payment that is being adjusted towards loan repayment is calculated at a lower wage rate than the prevailing market rate, i.e., Rs 8 per day when the prevailing wage rate is Rs 10 per day. Thus, it involves additional implicit interest charges. It is to be noted that the minimum wage rate for unskilled agricultural labourers as declared by the government of Orissa was then Rs 25 per day.

In Harinababi a part-tenant has borrowed Rs 400 from his lessor for cultivation. Here the contract is that he will repay the loan in terms of paddy at the market price just after harvest. As the harvest price of paddy is low, an implicit interest is charged. In the non-irrigated village Sandhagaon one part-tenant and two pure tenants have borrowed from their lessors. The part-tenant had borrowed Rs 50 which he repaid in cash by selling straw. Two pure tenants have borrowed Rs 200 and Rs 300 at 60 per cent interest rate which they will repay in terms of labour.

From all the above instances it is found that the loans from the lessors are not interest free. And the interest rates charged whether explicit or implicit are quite high. Moreover, the landowners who are having additional sources of income from salary or small business other than agriculture are lending to the tenants.

In backward agriculture the interest rates charged on privately made loans are often exorbitant. Table 2 shows that the interest rate when charged explicitly is extremely high, i.e., either 60 per cent or 120 per cent, whereas the interest rate in the formal sector is only 12 per cent. The reasons for usurious interest rates prevailing in backward agriculture have been probed by many economists. The different viewpoints can broadly be categorised into three schools of thought, viz., the lenders' risk hypothesis, the default hypothesis and the theory of interlinkage.

According to the lender's risk hypothesis propounded by Bottomley (1963), while advancing loans the lender faces the risk of default and the lender has to add a premium to the opportunity cost of money to cover the likely loss of capital due to default. Once this risk of default is taken into account, the effective interest rate may turn out to be no higher than its counterpart in the organised sector. Consequently there is no real room for arbitrage and high interest rates persist unabated. But this lender's risk hypothesis has been

vehemently criticised as the moneylender is always the dominant party in the loan transaction because of his large resource base and monopoly position. In the specific power relations that prevail in village communities, it is very unlikely that the borrower can default the loan and go scot-free. Thus the lender's risk is more myth than reality and the lender is rational enough to extend loans only against collateral kept as security. And in case the borrower defaults, the collateral is confiscated by the lender.

Knowledge of this social fact prompted Bhaduri (1977) to expound his 'default hypothesis' which says that the lender deliberately raises the interest rate to cause default and confiscates the collateral kept as security. In Bhaduri's model the essence of usurious extraction lies in undervaluation of collateral. Here the concept of interlinkage creeps in through the back door, though Bhaduri (1977) has nowhere explicitly considered interlinkage in his model. In Bhaduri's schema credit market is characterised by risk of default, there is a tendency for the credit market to be interlinked with the asset market to provide insurance against risk of default [Swain 1986]. Rao (1980) questions the theoretical adequacy of Bhaduri's model on the ground that it fails to capture the essence of credit phenomenon in backward agriculture by focusing on exchange categories rather than production relations or real power relations. In Bhaduri's model the limits to credit relation are set not by personal or class power but by organised credit market. Rao (1980) in the typical Marxist tradition argues that the economic power relations between borrowers and lenders are the chief determinants of the interest rates on credit transactions in rural areas. The distinction between lenders as a group and borrowers as a group is a class distinction reflecting unequal distribution of control over the means of production and subsistence.

In our study villages different types of

linked credit contracts are observed as shown in Table 3. In village Charapara it was found that four years back an MF had borrowed Rs 800 by mortgaging 0.64 acres of non-irrigated land with a large farmer of the nearby village which he has not yet been able to repay. The condition was that when he repays the loan, he would get back his land. As long as full repayment of the loan has not been made, the lender cultivates the land and retains the crop produce as interest charged towards the loan.

By contrast, in the non-irrigated village Sandhagaon a landless pure tenant is found to advance Rs 700 to the landowner with the stipulation that he will cultivate the landowner's 2 acres of land and retain the entire crop produce until the landowner repays the loan in full. And he is cultivating the land for the last four years. The occurrence of this type of reverse usufructuary mortgage in dry land areas is also mentioned by Jodha (1981) and Srivastava (1989a). Another case of interlinked asset and credit contract is also observed in this village. A landless casual labourer has borrowed Rs 1,500 by placing his gold necklace as collateral near a large farmer in the nearby village. The market value of the necklace will be about Rs 3,000 and he is permitted to borrow up to Rs 1,500, i.e., half of its price. He is also charged 60 per cent interest rate. When he repays the loan, he will get back his necklace. Thus in an hour of need the village poor mortgage whatever assets they possess to get a loan. Whereas the landed classes are found to borrow from institutional sources like commercial banks and co-operatives against gold or land kept as collateral, the rural poor do not have such access. It is the poverty of the resource poor households that compels them to borrow from private sources even at usurious interest rates.

However, no landless poor households reported losing land due to non-repayment of loan excepting one case witnessed

in Charapara. In Charapara all the landless scheduled castes reported that their ancestors did not own any cultivable land. Only one higher caste widow in Charapara said that 50 years back she lost her entire holding as the moneylender confiscated all of her land due to non-repayment of loan. This agriculturist moneylender and his younger brother together had owned about 45 acres of land. Due to disintegration of joint family when the land was divided each inherited 22.5 acres of land. After their death the land was further divided among their sons. One had five sons and the other brother had three sons. Thus ultimately the landholding size of the present heirs come to less than 7 acres per household. All of their family members are settled in cities and they are now selling their land. Thus the offspring of big farmers are gradually becoming detached from cultivation. Due to population growth, Hindu law of inheritance and sub-division of landholding, the average operational holding size is gradually declining. As a result, large farmers having enough surplus to engage in usury are rarely found in the villages. Thus a Bhaduri-type exploitative moneylender is no longer found in the villages under study though in the past such a class did exist. There are many novels in Oriya depicting the exploitative character of the zamindari class [Pati 1992] but that class no longer exists.

Recently there has been a spurt of literature on interlinkage which propounds that if no interest rate is charged this does not mean an absence of usury, since there may be implicit interest charge in the form of a lower wage payment or purchase of crops at less than the ruling market price from the borrower. In order to examine this, according to the mode of charging interest we have divided private loans into three categories: with explicit interest, implicit interest and zero interest.

Table 2 shows that in the case of the landowning class a major proportion of loan is from friends and relatives, where no interest rate is charged. Usually a landowner borrows from his relatives and friends at the time of his daughter's marriage. But in the case of landless labourers and pure tenants the loans are charged either explicit or implicit interest. In Sandhagaon a significant proportion of borrowing by the landless class are charged at a zero interest rate. But the fact is that they have borrowed from a shopkeeper from the nearby village from whom they buy all their groceries. This loan from the shopkeeper may be interpreted as having implicit interest charges. Because only the regular customers of the shopkeeper are

eligible to get loans. And the shopkeeper charges higher prices, about 10 to 15 per cent higher than the prices charged by nearby town shops.

III Interlinkage between Labour and Credit

In backward agriculture, the boundaries of the village labour market are often narrowly delimited and heavily dependent on social and territorial affinities. Personal knowledge of the employers in relation to the work capacity, reliability and trustworthiness of particular labourers plays a crucial role in hiring labour [Bardhan and Rudra 1985]. These affinities are often cemented by relationship of regular consumption credit, provision of rent-free land or homestead land and wage advances. In the absence of any developed market for credit and insurance these interlinked transactions act as an imperfect substitute and perpetuate the territorial segmentation of the labour market even in adjacent areas. In this section we will analyse loans linked with labour, employment of semi-attached labourers and farm servants in our study villages.

Table 3 shows that in village Charapara landless labourers have taken loans of Rs 1,850 against the promise of future labour in the lender's field. When a labourer repays loans in terms of labour he is paid a lower wage than the prevailing market wage rate and thus implicit interest is charged. In Sandhagaon also a landless casual labourer has taken a loan of Rs 150 which he will repay in terms of labour.

The landless class possess only their labour which they can pledge to get a loan.

Attached labourers are found only in the irrigated villages. In the irrigated villages, as agricultural operations are undertaken throughout the year and availability of labour is an acute problem at peak periods, the medium and large farmers prefer to make labour tying arrangements with the labourers by providing them land for cultivation or homestead land, so that the labourer is compelled to work for the employer when the employer is in need of his service. The labourer is paid wages for the days he works for the employer. Details regarding attached labourers are given in Table 4. The contract is usually agreed in the month of March and for one year which may be renewed after completion of the year. The landowner provides some homestead land or land for cultivation to the labourer for the period of contract, for which the labourer becomes attached to the employer. If the contract is not renewed or violated then the landowner takes back the land. The attached labourer can cultivate his own land only when his employer does not have enough work for him.

The attached labourers are paid a wage rate less than the prevailing wage rate. As the table shows, the wage rate varies from individual to individual. The wage rate increases with years of employment. The attached labourer who has remained attached for the last 30 years is receiving a daily wage of Rs 10 whereas others get Rs 8 or Rs 9 per day, as against the prevailing wage rate of Rs 12 per day. The

attached labourers reported an increase of Re 1 in wage rate over last year. In a year they work for the employer for about 300 days. When the employer does not have enough work, the attached labourer has the freedom to work for other employers. In Charapara one attached labourer is paid in kind for 200 days. The cash equivalent of paddy that he gets as wage is Rs 8.50 per day. Nowadays the attached labourers prefer to be paid in cash as cash readily buys rice from the market whereas they have to prepare chaula (uncooked rice) from paddy. In Harinabahi one MDF has kept an attached labourer and he is paid Rs 300 in addition to his usual daily wage but no land is allotted to him.

The attached labourers usually borrow from their employers at the time of their need either in cash or in kind and repay it in terms of labour at the usual wage rate in which they are paid. In the table it is shown that two attached labourers have borrowed Rs 200 and Rs 600 which they have repaid in terms of labour. One attached labourer takes an advance in kind (paddy) from the employer which he repays in terms of labour.

Prior to their present employment all the attached labourers were working as casual labourers. All of them reported that their other family members (like wife or father) are working under their employers as casual labourers. Engaging of attached labourers has decreased whereas the employment of farm servants or fully attached labourers is on the increase. This is because the resident labourers are no longer interested in labour tying arrangements with landowners, as they are getting work round the year. The big farmers keep farm servants to get dependable labour at any hour of the day. The arrangements regarding employment of farm servants are discussed below.

The big farmers sometimes advance loans to some labourers to buy their loyalty and to avert their group assertiveness in collective bargaining. In this regard Bhalla's (1976) study in Haryana reveals that the landowners employ some trustworthy workers as permanently attached labourers who supervise the work of casual labourers and this arrangement works as a check on class solidarity. These workers who are willing to make required behavioural adjustments are paid wages above their marginal products as tied rent or ability rent.

Findings regarding farm servant particulars in our study villages are summarised in Table 5. In Charapara and Harinabahi the medium and large farmer owner cultivators keep farm servants to get dependable labour supply at their beck

and call. Usually a big farmer keeps an attached labourer, a farm servant and a cowherd to get dependable labour supply. The table reveals that out of nine farm servants five are from tribal areas and are scheduled tribes. All of these immigrants from tribal areas have owned land (non-irrigated) in their native place. But they have migrated to irrigated areas; because their native place is droughtprone and what they produce is insufficient for their consumption requirements. Wage employment, moreover, is not available. All of them have come from one district, Keonjhar, as the first immigrant gradually brings his friends and relatives to be employed in the village.

The contract is made for one year. In the case of immigrant tribals the period of contract is from January to January as in their native place a new year starts from a festival called 'Makara' which falls in the month of January. But the local farm servants are employed from March to March when agricultural operations for kharif paddy start. The immigrant farm servants stay in the landowner's house and their maintenance expenses are borne by the employer. Also, they are paid salaries varying from Rs 1,000 to Rs 1,800 per annum. The farm servants who are associated with a single employer for many years are paid more and every year their salary increases by about Rs 100. They usually work for 10 hours a day which includes field and domestic work. Sometimes they supervise the work of the casual labourers. All the employers of farm

servants have extra income other than cultivation like professional, salary, remittances and pension, etc. The native farm servants usually take cash advances at the beginning of the contract year which they repay in terms of labour. But immigrant tribals are paid after the completion of contract period. The farm servants are given clothing twice in a year on the main Oriya festivals 'Raja' and 'Dussehra'.

In the case of the non-irrigated village Sandhagaon even marginal farmers and landless tenants who have other sources of income keep farm servants. These servants are called as 'halia' (ploughmen). The contract is made from March to March and in most cases salary is fixed on a monthly basis in contrast to the annual payment made in the irrigated villages. As the employers are salary holders they engage farm servants to undertake agricultural operations and also to supervise the work of other hired casual labourers. In Sandhagaon five out of six farm servants are immigrants from jungle areas and four of them have possessed land in their native places. They also cite the same reason as the farm servants of irrigated villages for their migration. But interestingly one of them reported that in his native place he had borrowed Rs 1,000 from a private moneylender at 60 per cent interest to buy a young bullock. In order to repay the loan he has migrated to this village to earn money. Thus, exploitation in one village has its repercussion on another village and shapes production relations in the target village.

This particular instance made the author speculate that interlinked transactions may be observed in a particular place not because of existence of poverty or unequal exchange relationship in that particular area but because of prevalence of poverty somewhere else. For example, in Punjab the employment of farm servants is on the increase and most of these farm servants are immigrants from backward and poor states like Orissa and Madhya Pradesh. Jobbers having connections with big farmers in Punjab regularly come to the drought-prone villages in Orissa and advance loans to the family members of the labourer who is contracted to work in Punjab for one year. In Punjab the labourers are given a fixed ration per week and no cash and they are compelled to work hard. Thus poverty in Orissa helps in the perpetuation of interlinked transactions in Punjab.

Likewise in our study area landowners from the irrigated villages go to tribal areas in quest of farm servants and the ex-

resident farm servants have now become casual labourers. Also the landowners are no more interested in keeping resident farm servants as they do not stay in the landowner's house and hence are not available at all times. During our survey many large farmers were found to grumble that the resident farm servants sometimes do not come to work on the pretext of illness when they are actually doing other highly paid work in marriage ceremonies. Also, marginal farmers who were tenants and are now hiring out labour in Charapara and Harinabahi have migrated to Calcutta and are employed there in unskilled manual work as gardeners, cleaners and watchmen in private companies. There they do not have any job security and the company did not pay them their full salary even once as it incurred a loss. Therefore, interlinkage is no more to be considered as an intravillage phenomenon. With overall development and with the improvement in transport and communication facilities the mobility of the depressed class has of

course increased but from one set of exploitation they enter into another at a different place and thus interlinkage has crossed village boundaries. In a vast country like India there is large scope for migration and as long as unbalanced regional development and inequality remain interlinkage will occur.

IV Interlinkage between Credit and Produce

In underdeveloped rural areas returns from cultivation are often low and insufficient for internal financing. Institutional finance hardly meets the credit requirements of the farmers. As a result private trader-lenders are emerging in the villages. Usually, the trader-moneylenders advance loans for the cultivation of cash crops like jute at the time of sowing or transplanting with the condition that after harvest the cultivator will sell the crop to the lender at a predetermined price irrespective of the market price. Conditions

vary with regard to interest payment.

In our investigation only one respondent, a small farmer owner tenant in village Harinababi, reported borrowing from a trader-moneylender. He had borrowed Rs 200 from the trader for two months. And after the harvest he repaid the principal loan amount in terms of jute at the prevailing market price but towards interest he paid 2 kgs jute per principal amount of Rs 100. As the price of jute was Rs 380 per quintal, interest for Rs 100 was Rs 7.60 for two months. So the interest rate per annum was 45.6 per cent. But here the borrower is compelled to sell just after harvest when the price is low. To that extent there is further implicit interest charged.

It is to be noted that 10 years back there were many trader-moneylenders in these villages advancing loans for cultivation of jute. In 1982-83 the price of jute increased sharply to Rs 1,000 per quintal as demand for jute increased due to floods in West Bengal. The farmers expecting high price started cultivating jute the next year but the price almost halved to Rs 500 per quintal. The price of jute is volatile in nature. Gradually there is decreasing demand for jute as the gunny bags are now being replaced by plastic and paper bags. Therefore, in Charapara farmers are not cultivating jute. Moreover, almost all the cultivator households have some supplementary income like remittance income or salary income so that they no longer go to the trader-moneylenders to borrow for cultivation purposes.

In Harinababi a tenant has borrowed Rs 400 from his lessor which he will repay in terms of paddy just after harvest at the prevailing market price. As the price of paddy is quite low at harvest time, it is again equivalent to charging of implicit interest rate.

V

Conclusion:

It is observed that interlinked transactions are more prevalent in irrigated villages than the non-irrigated village. The tenants, attached labourers and farm servants are subject to exploitation as the interest rate charged either explicitly or implicitly is found to be exorbitant, wages paid to the workers are low and the minimum wage declared by the government is not paid to the labourers. The labour tying arrangements here are in sharp contrast to the free labour found in capitalist agriculture. The relationship between the employer and the employee is not a symbiotic relationship as Bardhan presumes. Rather it resembles a dominant and

dependent relationship where the landowning class has the upper hand. Through different contrived ways the landowning class extract surplus from the poor peasants. The modality is different from that observed in a feudalistic society characterised by extraeconomic coercion. There is considerable variation in wages with regard to status of the farm servant (resident or immigrant) and also wages increase with period of association with the employer.

The mode of exploitation is always defined with respect to a stage of historical development of a society. Bhaduri's model of interlinkage between usury and tenancy is perfectly applicable to Orissa under British rule when a 'zamindari' class with large landed estates spread over a number of villages dominated village society and were mainly a rentier class. The environment and colonial state policy then were not congenial for cultivation by this group [Padhi 1985]. Therefore, they tried to increase their hold over the peasants by combining usury with tenancy. In the changed circumstances of contemporary Orissa such explanations of agricultural stagnation are not tenable. No such class exists now. Implementation of Orissa Estates Abolition Act (1952), ceiling on land, sub-division of family holding due to law of inheritance, disintegration of the joint family system and pressure of growing population on limited land have combined to produce a levelling down in landholding size in Orissa. Accumulation of land in the hands of rich peasants or class polarisation is not at all visible.

Our analysis shows that the Marxist approach though more appropriate in explaining interlinkage than the neoclassical approach, is not sufficient and needs to be supplemented by an overarching macro framework so that the persistence of tenancy and the emergence of interlinked deals can be adequately explained. In this respect we have emphasised the migration aspect which has not been given the attention it deserves. Migration provides a solution to some of the puzzling issues like persistence of interlinkage being consistent with the development of market forces.

We emphasise that power relations do not remain constant and that with change in macro variables and other economic forces the power structure is itself changed. Thus, for example, the law of inheritance and disintegration of joint family system appear to have resulted in no large farmers having substantial surpluses, while due to improved transport and communication facilities the oppressed class has itself

migrated, giving place to another set of immigrants from remote tribal areas.

Tenancy and interlinkage can be better explained by the Marxist approach but when enmeshed in a macro framework attempting to study the changing power relation with respect to changes in macro variables like overall population growth, the unemployment rate, the rate of industrialisation, unbalanced regional development and other economic factors like migration caused by overall development. Historical antecedents and the role of the state should also be integrated to the analysis to provide a holistic view.

To sum up, our study reveals that interlinkage clearly exists in the sample villages. But it is not to be considered as a dominant set of relationship as has been suggested by some Marxist writers. The role of migration in the persistence of interlinkage is significant and needs to be emphasised and incorporated in theoretical analysis of interlinkage.

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

Sudhansu Ranade

BALDEV RAJ NAYAR's article 'Business and India's Economic Policy' (*EPW*, September 1998) is interesting. His analysis of the historical factors that put Indian industry at a disadvantage vis-a-vis foreign competition (last column, p 2455) when external liberalisation was suddenly brought in simultaneously with internal liberalisation in 1991 is superb. I have never seen the case presented so clearly and concisely. Some points in the article do, however, need attention.

First, the convergence of interests between domestic industry and the Indian Left in fact began well before the 'sudden' liberalisation in 1991. By 1987, for instance, the motivated debate about the 'inefficiency of the public sector' was well under way and had gained a great of momentum. The Left had by then become all too aware of the threat looming on the horizon. I particularly remember a conference of public sector labour unions that B T Ranadive, politbureau member of the CPI(M) and backbone of the CITU, addressed in Bangalore. One of his important messages to the gathering at that occasion was that there was an urgent need for public sector workers to give value for money. We have been telling the workers, he said, about the exploitation of surplus value. From this some have concluded that 'the more we work, the more we are exploited; so why work'. But now the wolf was at the door. Ideologues at the World Bank and elsewhere had begun to bay for the blood of the 'inefficient', resource-strapped public sector; the MNCs lay in wait just outside the door. These pressures continued to increase, and the Left, which only a few decades ago was busy denouncing even the Indian public sector as being basically committed to private interests, and busy 'organising the working class' in a way that contributed a great deal to making the public sector 'inefficient' (thereby squandering a critical opportunity to give the Indian state a degree of autonomy vis-a-vis private capital), has today been pushed in desperation to in effect making common cause with the private sector.

The second thing to note is that despite Nayar's powerful arguments on the threat that Indian industry is facing from imports (p 2456, col 3), by his own account our industry is not all that concerned about the sad way in which "their profits are being squeezed by cheaper imports". Thus, Nayar later goes on to say (p 2464, col 2) that "business does not perceive a general

increase in tariffs to be necessary". While he does say something at this point about "calling a halt to further reductions" and "additional levies on specific items to compensate for the extra taxes that local business has to bear", it would seem as if, in general, according to him and the industrialists he was speaking for, the threat from imports on account of liberalised access, reductions in rates of duty, and the lack of a level playing field between domestic producers and producers abroad (on account of, say, lower rates of interest abroad, and cheaper and more reliable sources of power) has been taken care of by the increase in the price of imports that has come about because of the fall in the value of the rupee, the associated rise in customs duty, and the readier availability of imported components. If one adopts this view, as Nayar does, there would seem to be no need at the moment for him to worry about 'where consumers will come from if local industry, overwhelmed by imports, is unable to provide employment'.

That brings me to Nayar's basic concern: the threat to Indian industry from the operations of the MNCs in India. On this, I would like first of all to say that it is not at all obvious to me that the government has no choice but to cater, in its own interest, to the interests of business. The logic is indeed compelling; but only after government has first satisfied itself that storing up domestic industry is in fact "in its own interest". Whether or not this is the case at any given time or place depends on the availability of other options to keep the economy in steam: with output, employment and tax revenues on their way up. At this stage it is worth quickly recalling the strong arguments that can be marshalled in favour of external liberalisation: foreign competition is thought to be useful because of inflows of currency, capital, technology and expertise, reduced prices, improved quality, bringing new markets into being in the country, and for reaching out to markets abroad. The formulation merits close scrutiny; there are a lot of useful ideas embedded in it.

Some points that need to be noted in this connection are, first, that even if there are no sure alternatives to reliance on domestic industry, it might still be worth giving a chance but promising alternatives a serious try if payoffs to successful implementation are high, and there is a fair chance that they might work. In addition to what foreign investors 'directly' contribute to income,

employment, exports, revenues, growth, and prospects of long-term growth (thanks to upgradation of technology, managerial efficiency and quality consciousness), valuable gains would accrue to us to the extent that they are able to pressure domestic industry on to a higher and more sustainable trajectory; with a better ability to compete in markets abroad, and to dynamically generate and cater to domestic demand (I shall return in a moment to the possibility of an ignominious collapse). Second, as regards Nayar's formulation that "it is our industry, we must protect it", surely the consumers too are our people; not only a small handful of rich industrialists. It would be different if one were talking of, say, the weavers. Third, as regards the need to allow domestic industry time to purge itself of its weaknesses, 'which after all were but a rational response to long years of stifling controls', it has been almost a decade; we cannot keep on singing the same old song forever. I do not have any easy answer to the fact that "labour legislation basically bars retrenchment of excess manpower inherited from the pre-reform era", but we do need to force increases in productivity. Redeployment might be an alternative to retrenchment. As for infrastructural inadequacies, these will affect MNCs operating in India as well, not Indian industry alone; both will suffer equally, though of course, ideally, neither should.

As regards Nayar's point that "the state has allowed MNC imports in areas that are reserved for small-scale industry whereas Indian business is not allowed to produce in those areas", the basic aim of the government seems to be to pressure small-scale industry without a very public reversal of policy. Note for instance the careful wording of finance minister Yashwant Sinha's recent message to the small-scale sector: it was time, he said, for them to "begin gearing themselves up to face competition. As the economy continued to open up, the protection they presently enjoyed (vis-a-vis large domestic industry) would become increasingly irrelevant." In a similar vein, soon after the budget was presented, when someone complained that things had got to the stage where 'even bindis were being imported', an official spokesman replied, "That was hard to believe. If good quality bindis were being produced within the country, it was hard to see why anyone would want to import them." It is worth noting in this connection that the bulk of small-scale production in the country (if one ignores the looms) takes place in units that are far from small. The plant and machinery ceiling that stood

at Rs 7.5 lakh about 15 years ago, now stands at Rs 3 crore. Total assets of these companies are very much larger; because the limit specifically excludes the large 'standby' investments that many of the larger 'small units' have made in land and buildings.

As for Nayar's point that the MNCs seemed bent on driving out competition from the sectors they entered and that this would leave Indian consumers at the mercy of these monopolies, it is not as if our companies have all along been vying furiously with each other to give the consumer a better deal. I readily concede that we as consumers are utterly wanting in discrimination, that we are very even-handed in scattering our favours over products and services that do and do not give good value for money. I concede too that the slick image-building activity of the MNCs will tend to increase our sucker-ability manifold. But there is some hope for us given that the MNCs are very sensitive to potentially damaging criticism, criticism that might stick. In this context, I have been suggesting for years that a small tax should be levied on the huge amounts of money that MNCs (and large Indian companies) spend on advertising. This amount should then be entrusted to a small, carefully chosen consumer protection group; for the strategic dissemination of countervailing information (intended more to encourage industry 'self-regulation' than to augment the flow of paper in consumer courts). The results could be dramatic. Further, it would be sufficient to levy the tax on advertising expenditure at a very small rate, say, 5 per cent; and limit it to only a handful of companies. In other words, what I have in mind is a greatly whittled down version of the tax on advertising services that is now in place (to facilitate easy implementability), and a major redirection of focus.

Then, Nayar complains that it is the successful companies which the MNCs particularly seek to buy out. I am not sure what to make of this point, since they have merely been buying from those who have been willing to sell. Presumably it is those who have not been offered attractive buy-outs that make these complaints; those who might find themselves edged out. And sure enough, the article complains, "Particularly in respect of joint ventures, it appears as if the MNCs are alarmingly eager to reduce or eliminate Indian participation and to assume complete control... While establishing new business ventures MNCs initially take on local partners on an equal basis but, after having acclimatised themselves to the local economic and political situation, they reduce their partners to a subordinate position or oust them entirely." But in the very next line,

in an effort to elaborate on this, the article makes it clear that there is really no need for the rest of us to shed any tears. (I should note here that there is no reason to suppose that income growth would be adversely affected if domestic industry passed into the hands of foreign companies. Nor is the rate of growth of employment – in the economy as a whole, rather than in the organised sector alone – likely to suffer, even in the short run.) It seems the only "underlying problem is that the Indian partner has few bargaining strengths, since he lacks technology and finance and is able to only facilitate contacts with government and provide local knowledge after a while, that asset has no value".

As regards the fear that "we might find one day the top 100 Indian companies are all foreign owned. In that event India might not be able to take the kind of independent stand it is currently taking on the CTBT or the NPT", this seems a bit far-fetched. To begin with the second part of the statement, the autonomy we once had in foreign policy has already been greatly eroded with the demise of the Soviet Union. It is India's ability to influence world opinion that will now be critical, not the ownership of our industry. As regards the first half of the statement, I find it hard to believe that our industry is so very wanting in resilience. And if it is, it can hardly be worth saving.

It seems to me that the argument put forward by Nayar is, rather, geared to ensuring a more secure and steady stream of unearned income to domestic collaborators, a more satisfactory division of the spoils, after the foreign partners no longer need "contacts with government and local knowledge". With the takeover code in place, it seems unlikely to me that the foreign partner would be able to forcibly take over the partnership when the domestic collaborator is no longer of any use. The real worry, it seems to me, is that the MNC can at that point threaten to walk out and set up shop on its own, thereby driving down the asking price.

Somewhere along the way, the article points out that if competition were such a good thing the developed countries would allow more foreign competition at home. Perhaps they would; if they too did not have strong entrenched interests making out that what was good for them was good for the country. Big business, certainly, but also organised labour. It is not only in India that such coalitions between the Left and the Right are to be found.

To show up foreign competition for what it really is, Nayar emphasises that much of the foreign investment is in the consumer goods sector. Surely this only means that this sector happens to offer the largest, quickest and surest profits.

Presumably this is also the reason why Indian industry would prefer to see foreign capital 'dominate' the infrastructural sector, 'lead' the export sector, and 'supplement' (rather than competitively supplant) Indian capital in the consumer goods sector. The tribute paid by domestic industry to foreign capital, by inviting it to 'lead' the export effort, is worth making a special note of. If the much made of 'affluent middle classes' cannot generate rapidly growing markets, we will have to seek markets abroad. Or slow down even further, to a dead stop. Unless, at the urging of Indian industry, government steps up public expenditure to revive flagging domestic markets. But then someone will later have to step into to revive the government; who knows where it will end.

But the case against MNCs is not so easily dismissed. This is because, even if you can get past emotional blocks, such rebuttals are specific to the arguments that are rebutted. It is simply not possible, at least in general discussion, to anticipate and then rebut all possible arguments that could be made against the entry of MNCs. (I have deliberately not referred to their 'unrestricted entry' because entry is at present restricted; and will continue to be so in the foreseeable future.) This is a problem that one often encounters.

When a layman sets out to evaluate someone's opposition on complicated issues, like the Narmada dam, or the 'changes' that have taken place in India's China policy in recent months, or the costs of India going nuclear, it does often happen that the case as articulated by this or that responsible person turns out to be demonstrably untenable. But laymen can discover these flaws only after a very great deal of work; only then can they make sense of the issues involved. But at the end of it, someone will tell you that all you have managed to do is to rebut one particular articulation of the argument. There are many others. In short, the job may be hopeless; the war unwinnable.

One last thing Nayar quotes at one point a passage from *Alice in Wonderland* where Humpty Dumpty, in a somewhat expansive mood, tells Alice: The real crux of the issue (meaning, in this particular case, the issue of the entry of MNCs) is one of control; 'the question is who shall be master'. As a matter of fact, just before these words were uttered, Humpty had said that so far as he was concerned, he made words mean pretty much what he chose them to mean. A sceptical Alice then raised the question of whether one *could* make words mean whatever one chose them to mean. It was to this that Dumpty, tottering, and about to fall, replied airily that the only question really was who was to be the master.

HOMI BHABHA CENTRE FOR SCIENCE EDUCATION

TATA INSTITUTE OF FUNDAMENTAL RESEARCH

V. N. PURAV MARG, MANKHURD, MUMBAI-400 088.

Visiting Fellowships at HBCSE

Advertisement No. 3/99

HBCSE is a National Centre for TIFR devoted to science and mathematics education from primary up to introductory college level. The Centre is looking for highly competent and committed scientists and communicators to contribute to its programmes in the areas described below.

➤ Olympiad Programme

HBCSE is India's nodal centre for the physics, chemistry and biology olympiads. It is also involved in the mathematical olympiad activity. We need Ph.D.s in mathematics, physics, chemistry and biology, having a strong problem solving ability in their disciplines. They would develop challenging theoretical problems and olympiad-level experiments and train meritorious students at senior secondary levels for the international olympiads.

➤ Curriculum Development

HBCSE is developing model alternative curricula for school science, mathematics and social studies. The primary school level curricular development is underway while middle and secondary school levels are to be taken up. We are looking for Ph.D.s in the natural and social sciences and mathematics, with originality and insight into their subject and a flair for writing and design. We would welcome persons with literary and visual communication talents in addition to a good subject background.

➤ Science Popularisation

HBCSE is producing activity and exhibition modules in several areas, including history of science, low cost experimentation, science-technology-society issues, gender issues, health education and astronomy. We need Ph.D.s in the natural and social sciences with expertise in these areas and an ability to present science in interesting and innovative ways. Literary, artistic and visual communication ability would be an added advantage.

➤ Research in Science and Mathematics Education

All of the above areas are informed by research into cognitive, sociological, historical and philosophical issues in science and mathematics education. We are looking for eclectic intellectuals with Ph.D. in the natural and social sciences and mathematics who would take up research programs in these interdisciplinary areas.

Besides the above R&D areas, the Centre organises orientation programs for teachers/students/teacher educators. Scientists of the Centre are expected to contribute to these training programs.

The preferred age is below 35 years, relaxable for deserving candidates.

Please apply on plain paper enclosing your biodata (including age, details of qualifications and relevant experience), a one-page statement of purpose and names of two referees. Please also indicate your area of interest among those listed above.

Applications will be received and screened throughout the year and referees will be contacted for recommendations. Shortlisted candidates will be called for a seminar/interview at HBCSE.

Selected candidates will be offered Visiting Fellowship for one year, extendable by one more year subject to satisfactory performance. The Fellowship carries an honorarium of Rs. 8000/- pm. At the end of the Fellowship outstanding candidates may be considered for absorption in the regular academic cadre of HBCSE.

Please address your application to Dr. Arvind Kumar, Centre Director, Homi Bhabha Centre for Science Education, TIFR, V. N. Purav Marg, Mankhurd, Mumbai 400 088. Tel. Nos. 556 2132, 556 7711, 555 4712; Email: arvindk@hbcse.tifr.res.in

You can't predict her future...

But you can protect it.

Raj Lakshmi
UNIT PLAN II

More than a gift. A future.

FEATURES

- Exclusively for the girl child upto 5 years of age.
- Minimum investment of Rs. 1,500 and in multiples of Rs. 500 thereafter with no upper limit.
- Any individual (parent, relative or friend), trust, society, corporate body, central or state government organisation can invest for the benefit of girl child.
- Investment of Rs. 1,500 made in the name of girl child upto and including age of 1 year can grow to Rs. 15,000 in 20 years; the actual growth of investment depends on age at entry.
- Date of maturity will be calculated from the date of acceptance of the application and not from the date of birth of the child.
- Option to withdraw from the plan at the age of 18 years of the girl child.

UNIT TRUST OF INDIA

13, Sir Vithaldas Thackersey Marg (New Marine Lines), Mumbai-400 020. Tel : 2068468

RESOURCES FROM SAGE

THE MIGRATION OF KNOWLEDGE WORKERS

Second-generation Effects of India's Brain Drain
BINOD KHADRIA

This unusual book takes a positive approach and explores how a nation losing its valuable human resources to another one can make the best of the situation. To this end, the author analyses the migration of knowledge workers from India to the USA over three decades and locates this phenomenon within the context of a civil society seeking to reconcile the dual loss of human capital and knowledge resources. Focusing primarily on the second generation of migrants, Binod Khadria proposes various ways in which to turn this apparent loss to the home country's advantage.

1999 • 236 pages • Rs 350 (cloth)

PRODUCING WORKERS

The Politics of Gender, Class, and Culture in the Calcutta Jute Mills
LEELA FERNANDES

Leela Fernandes proposes that the boundaries between gender, class and cultural identities in the workplace are the product of political processes that unfold in the course of everyday life as managers and workers engage in contests of power. She vividly conveys the dynamic relations among the classes and castes and the men and women who work at the mills, revealing how diurnal encounters are marked by hierarchy, opportunity, and relations of power and deprivation. What appear to be simple workplace disagreements are shown to be enactments of caste allegiance, labor-management opposition, gender politics, and ideological belief, all of which are representative of overlapping and conflicting identities.

DECENTRALIZED PRODUCTION IN INDIA

Industrial Districts, Flexible Specialization, and Employment
Edited by **PHILIPPE CADENE** and **MARK HOLMSTROM**

A must read for small scale businessmen, SSI federations, scholars and governments. The book's central idea is that liberalisation is no cause for long term anxiety for small firms. They can get together and cluster in industrial districts. That would impart them the strength to concentrate on a range of complementary products. The authors show how that can be done. The focus is practical, with examples drawn from countries like Italy and stresses decentralised production and employment opportunities.

Informalisation and Labour Security

An assessment of policies in India and elsewhere to promote sustained economic growth and secure employment, especially in small and medium enterprises where most of the new jobs are likely to be, indicates that new variants of flexible specialisation emerging in India may have wider application. L-2
Economic liberalisation has resulted in the growth of new industries and significant informalisation which together with rural-urban migration has made for greater vulnerability of labour. This has prompted new institutions of social security from within. How effective are they and what problems do they confront? L-10
Neither the state nor the trade unions have adequately addressed the problems of social groups working in the informal sector. The Hamal Panchayat, which has mobilised load carriers/coolies throughout Maharashtra is an initiative in creating a broad based political alliance of the unorganised. L-19

Options in East Timor

A lasting solution to the crisis in East Timor can be found only through the strengthening of democratic movements in the region. 2784

Two Sides of Same Coin

I AM aghast at the position taken by P R Ram (*EPW*, June 19, 1999) on maintaining equidistance from the BJP and the Congress. Even a brief acquaintance with the history of the Congress in the last three decades should be enough to see through its claims of being a democratic, secular party.

From 1969 onwards, under the leadership of Indira Gandhi, the Congress began to systematically lose any democratic credentials it could earlier claim, even partially. The brutal killing of hundreds of naxalites in West Bengal during 1969-72 by the state machinery needs no elaboration. Despite the populist slogan of 'garibi hatao', in practice the Congress under Indira Gandhi increasingly became a vehicle for her authoritarian rule in favour of the interests of the elite, culminating in the Emergency of 1975 and the rise of the dynasty. Later, in 1980, it was Indira Gandhi who opened the political space for hindutva by closely aligning herself with perceived Hindu interests.

The issue of economic policies and the danger that both the Congress and the BJP represent in this area deserve serious scrutiny. Economic policies are not disembodied from the nation and its people. They reflect the larger social vision of the nation and its people that the rulers have. In this framework, it is pertinent to ask as to why there is such an alarming overlap between the economic policies of the BJP and the Congress (in fact, across almost the entire spectrum of political parties).

In recent years, despite their occasionally contrasting rhetoric, the Congress and the BJP have become vehicles of the ruling elite. Both the formations reflect their interests and their predicaments. In fact, it would not be too far-fetched to suggest that the Congress and the BJP are the two faces of the Indian ruling class. The hindutva project of the RSS is simply another variant of the vision of the ruling class for the nation just as for a while the Emergency was. It is this overlap that presents us with the irony that those leading sections of the society who had enthusiastically supported the Emergency have now rallied around the BJP.

The BJP, of course, is a political wing of the RSS. But the RSS itself is no longer the petit bourgeois RSS of yesteryears. The RSS today has begun to reflect the aspirations of a larger section of the Indian upper castes and classes who are terrified

of any large-scale shift in the political, economic and social balance of power in favour of the less privileged groups in society. These sections are no longer sure that the Congress alone is well-equipped enough for that job. They want an alternative and now they have that in the BJP. The result, politically speaking, is that the Congress and the BJP are much the same party. Ram is wrong in his belief that just because the Congress, unlike the BJP, has no RSS to provide it with ideological moorings, its fascistic and authoritarian vision is somehow less dangerous. The fig leaf of secularism, programmatic or opportunist, should not blind us to the reality that at their core both the main political formations in the country reflect the same class interests. Not surprisingly, whether it is the Mandal commission or economic policies, both parties play almost the same tune.

The history of major communal riots in the last three decades or so repeatedly exposes the deep complicity of the Indian state with communal forces, specifically Hindu communal forces. During this period, the Congress has been in power at the centre and in the states where major incidents of communal violence have taken place. While the RSS and its affiliates pose a serious threat to plurality in the country, they cannot be easily and meaningfully isolated from the larger emerging scenario. For example, in the last two decades major communal riots have taken place in Maharashtra, including the Bombay riots of 1992-93. The

Shiv Sena, which has been in the forefront of these riots, has always been a protégé of the leading Congress politicians in the state. And Maharashtra is not an isolated example. In the UP and other states, the complicity of the Congress with the communal forces has been deep.

The anti-Sikh violence after the assassination of Indira Gandhi in 1984 was cynically engineered by the Congress. Later, the Congress government at the centre consistently and systematically tried to scuttle any attempt to get the guilty punished. For the first time, this violence suggested an organised, planned pogrom to threaten a religious minority in India by a political party in power. The Bombay riots were similar. The active role of the police in communal violence also reflects the crucial role of the state machinery in fanning and engineering communal violence against minorities.

That apart, in India, communal violence cannot be easily isolated from the larger issue of social violence to protect the class, caste and gender interests of the privileged. In all these conflicts, there is little to distinguish between the BJP and the Congress. In other words, the theory of equidistance from the Congress and the BJP is the necessity of the times, if we wish to even begin to explore the serious possibilities of making a democratic, secular India for the future.

Population and People

IN October will be born the six billionth child somewhere in the world; by 2050 India will be the most populous country; 4.8 billion people live in developing countries; there are 120 million people who have been classified as migrants. For decades population pundits have used the mesmerising impact of numbers as a pivot for their theses on the horrors of uncontrolled population growth. Notwithstanding the ideological arguments, the fact that the rapid increase in population is occurring in the poorest, resource-scarce countries with the lowest indices of development cannot but be a matter of concern for even those who do not subscribe to doomsday models of population explosion

Although the UN document today blandly assures us that the International Council for Population Development's new agenda is based on the "understanding that each sovereign country will implement the agenda according to its own priorities and perceptions", there is enough documentation to show that developing countries' efforts in population control have been monitored and controlled by international donor and funder agencies as well as more indirectly by vast pharmaceutical companies who see third world countries as markets for new contraceptives of questionable efficacy and safety. Between the 1960s and the 1980s these agencies either initiated, aided or were witness to some of the grossest abuses in the form of coercive practices of governments across the globe. If today UN agencies speak with a human and humane voice, they do so because of a number of developments, the most important of which has been the evolution of the women's movement and its projection of women's rights over reproductive choices. While there has been some incorporation of issues like reproductive health and women's rights, reading the advance press copy of the UNFPA's *The State of the World Population 1999*, it is easy to forget this history. And that would be inimical to consideration of the serious sociological and political issues that need to be raised with regard to population growth, people and societies.

The UN has made three projections about how the numbers will grow by 2150: the first, if fertility continues to drop until women have about two children each, world population will stabilise at 10.8 billion; the second, if the average is 2.6 children the population will quadruple to 27 billion; and, finally, if fertility drops to 1.6 children the total will be only 3.7 billion. Currently the average family size is about three from almost six children in 1969 – although of course it varies between six in some parts of the world to 1.4, below replenishment level, in some others.

While these numbers are being bandied about, the fact that a reduction in family size across communities will have an effect on various other aspects of society appears to be largely ignored. Studies have indicated that family size is closely related to other factors of class, caste, women's status and education and employment opportunities. And, even more

importantly, that the relationship is complex and not necessarily linear, varying across regions as well as castes and communities. For example, Tamil Nadu's demographic transition, with a history so different from Kerala's, came as a surprise and has been the focus of much debate. While demographers have drawn from these experiences to fashion population control strategies directed at changing these social and economic indicators in order to induce the appropriate reproductive choice, there is much less concern about the societal and psychological/behavioural changes that smaller families will effect. Studies of single-child households in China have shown that not all the changes that occur may be socially harmonious or economically benign. Moreover, over a period of time shrinking family size will mean the narrowing and perhaps breaking down of old family support systems. What will replace these structures and institutions? If the state cannot offer such support systems, they will emerge undoubtedly, as they are already doing, as private enterprises. Market logic will dictate that a large majority will have no access to these services. In poor countries, smaller families will mean a larger proportion of ageing, 'non-productive' populations which in the absence of support structures to replace traditional family-based ones, will increasingly be seen as 'burdensome' to the state. Population control strategies have not so far costed for this consequence of smaller families nor has adequate attention been paid to studying the socio-psychological transitions that are under way because of the reproductive choices people are making. Another demographic fact is the increasing flow of people out of developing countries, as the UNFPA document points out. What societal and political consequences will this have and how will geo-political developments alter these flows?

It would be easy to fault the UNFPA for its unwavering focus on controlling numbers. For all its humane concerns about food security, environment and poverty, unequal consumption patterns and so on, its agenda is not primarily the evolution of an equitable world, however distant such a vision. What emerges in consequence is the utter irresponsibility of country governments to deal with population growth realistically as an aspect of societal growth and not as an obstacle to development. Strategies have been founded on the supposedly disastrous consequence of population growth; as, for instance is the Indian population policy waiting on the sidelines for the constitution of the new Lok Sabha. There is sufficient evidence today to show that the pattern of demographic change is not uniform or linear, and it has subtle and gross consequences which vary across regions. It is imperative that we begin to see demographic change as social change and regard its engineering as social engineering in all its dimensions. Only by so placing population growth in its social perspective can we hope to deal with it creatively and humanely.

Churning without Change

THOUGH it was not unexpected, the detonation of sophisticated explosives by the ultra left groups active in south and central Bihar during the first phase of polling in the state, resulting in the death of 50-odd persons, mostly security personnel, was a more trenchant indictment of the state of political democracy obtaining in the state than the ruckus over the alleged circulation of fake ballot papers. The credibility of the electoral process in Bihar has been severely dented over the years not only by rampant malpractices but also by the proven ineffectiveness of the state apparatus in the face of the regular poll-boycott calls given by the extremist groups. Yet elections in Bihar continue to generate excitement since the state sends the second largest number of legislators to parliament among all the states, because of which all political parties share a vested interest in maintaining the electoral facade in the state, even though they fail to address the state's basic problems in their election campaigns or when in power.

Given the volatile conditions there, Bihar is the only state where the Election Commission thought it necessary to stagger the polls in three phases. The caste arithmetic, which has largely determined the electoral outcome in the state, too has undergone a significant change for the first time since the ascendancy of Laloo Prasad Yadav in 1990. Laloo Yadav, riding the Mandal wave, had succeeded in building a broad coalition of the backward castes, the dalits and the Muslims as a bulwark against the BJP. But the Yadav-centred politics promoted by Laloo Yadav during his nine-year rule resulted in large-scale alienation of the advanced middle castes, the most backward castes and dalits. If the departure of the powerful kurmi leader, Nitish Kumar, and the formation of the Samata Party with George Fernandes was the beginning of the disenchantment with Laloo Yadav, the consolidation of diverse non-Yadav caste groups in the form of the Bharatiya Janata Party-Janata Dal (United) combine as witnessed now marks the further advance of the process. These castes together outweigh the 27 per cent Yadav-Muslim vote which till now formed the bedrock of Laloo Yadav's support. Not surprisingly, exodus from Laloo Yadav's RJD began once the BJP-JD(U) alliance emerged. The pre-poll scene in the state also saw some erosion even of the Yadav base of the RJD, with at least 12 Yadav heavyweights contesting as independents or on the JD(U) ticket. With assembly elections round the corner, this has to be a cause for concern for Laloo Yadav.

The elections in north-central and south Bihar will largely be bipolar, between the JD(U) and the RJD, and the BJP and the

Congress, respectively. Even so the role of the Jharkhand parties in south Bihar, the CPI(ML) (Liberation) in north Bihar and the CPI in central Bihar in attracting votes will be crucial in tilting the outcome in favour of the one or the other of the two main combinations in closely-fought contests. And though the ballot may send high profile leaders like George Fernandes, Nitish Kumar, Ram Vilas Paswan, Sharad Yadav and Yeshwant Sinha to parliament, the flood-affected 18 districts in north Bihar and the naxalite-run 17 districts in south-central Bihar are symptomatic of the persisting problems at the ground level. In that context, any change brought about by the present polls will be once again cosmetic.

INDUSTRY

Indian Business and Foreign Investment

ONE of the major preoccupations of our apex chambers of commerce and industry in recent times has been lobbying the government against the setting up of wholly-owned subsidiaries by foreign firms which already have functional joint ventures in India. The present rule on the subject says that such setting up of a subsidiary can be permitted provided the existing joint venture certifies that it has no objections to the new venture. Industry associations feel that this is not sufficient protection for the Indian partners of the joint venture and seek a ban on such wholly-owned subsidiaries.

What exactly happens when the foreign partner of an ongoing joint venture sets up a wholly-owned subsidiary? If the new venture is to develop product lines altogether different from those pursued by the existing joint venture, there is no cause for heartburn. If not, there is a problem. Except in the case of conglomerates such as GE, there would not be many foreign firms that seek to set up separate entities in India to pursue activities entirely different from one another. In the majority of cases, the new venture would duplicate the functions of and eventually replace the existing joint venture. So there is no doubt that a new wholly-owned subsidiary would go against the interests of the existing joint venture. What are the pros and cons of allowing a foreign firm to set up a wholly-owned subsidiary in product lines similar to the ones engaged in by its existing joint venture in the country?

The industry associations readily present the negative consequences. Existing joint ventures are owned by Indian shareholders, apart from by the foreign firms. Indian shareholders of a joint venture would typically comprise an Indian business house, financial institutions and individual investors. When the foreign firm sets up its new wholly-owned subsidiary, it would

shift emphasis to the new company. Using its clout on the board of the joint venture, it might even effect the transfer of the more profitable product lines to the new subsidiary, and conduct all expansion of the product line through the new subsidiary, leaving the joint venture high and dry.

Since the rule at present is that the foreign firm can apply for setting up a wholly-owned subsidiary only after obtaining a no-objection certificate from the joint venture, aren't Indian shareholder rights already protected? Industry associations point out that minority shareholders are not really in a position to influence board decisions and so the foreign partner in the joint venture is likely to get its way without much trouble. Although it is possible to cite examples of Indian partners successfully holding out against their foreign collaborators starting new wholly-owned ventures, Indian industry associations have a point when they say that minority shareholder views do get swamped in board decisions. Indian industry is pretty knowledgeable when it talks about the treatment of minority shareholders.

Apart from banning new wholly-owned subsidiaries, there could be other ways of protecting the minority shareholders of existing joint ventures. The government could stipulate that a foreign firm that already has a joint venture in the country but wants to set up a wholly-owned subsidiary should give Indian shareholders of the joint venture the option of exiting from that shareholding. In other words, the foreign firm should buy out the Indian shareholders at a reasonable price. In a functional stock market, the share price reflects the worth of the company. Shares that deliver control always go at a premium. So asking the foreign firm to offer to buy up the Indian-held stock of its joint venture at a reasonable price including a premium on the current market price is not unreasonable. In fact, such a stipulation is a necessary condition for any joint venture to find equity financing at a reasonable price. In the absence of such a stipulation, Indian investors would be hesitant to put their money into ventures that run the risk of being converted into shell companies by the foreign partner setting up, later on, a wholly-owned subsidiary. That hesitation can, of course, be overcome but only by offering equity at a discount large enough to offset the risk of redundancy arising from the foreign firm's likely wholly-owned subsidiary. The option of exit at a good price will eliminate this risk and its associated discounting effect on equity pricing of joint ventures.

Foreign investment – direct, portfolio, in joint ventures, in wholly-owned subsidiaries – augments investible resources and enhances the creation of jobs and incomes. Typically, direct investment brings with it, apart from investible resources, technology, management and

corporate governance that are superior to what obtain in the domestic economy. The economy can do with all these. Finally, foreign investment brings in newer, better products, with gains for Indian job-seekers and consumers. This applies to wholly-owned subsidiaries that might replace joint ventures as well.

A foreign firm typically plans to set up a wholly-owned subsidiary when it wants to expand the scale of operations in the domestic economy. It might want to bring in proprietary technology that it does not want to share. Or it might want tighter management. Unless it plans to enhance its operations, it makes no sense to set up a new wholly-owned firm alongside a joint venture. This expansion of activities is in the interest of Indian job-seekers and Indian consumers.

But the effects of such expansion are not universally benign. One group of Indians stands to lose out. These are the Indian partners in the joint ventures. When they are bought out, they will be left with no companies to run. The bought-out Indian partners would have with them large investible funds, which they could use to set up fresh ventures. So the only real cost of the wholly-owned subsidiary is that Indian industrialists will have to prove their entrepreneurship in new pastures.

EXIT POLLS

Missing the Issue

THE Supreme Court's judgment rejecting the Election Commission's proposal to ban publication or telecast of opinion and exit polls makes interesting reading. While it has indeed pleased the media, some of the observations made by the honourable judges raise certain questions that are not necessarily related to the merits of this particular case, but are nevertheless relevant.

First, while dismissing the EC's petition, the five-judge Constitution bench made it clear that it had not gone into the question whether the poll-related guidelines issued by the EC were violative of the fundamental rights of freedom of speech and expression. But was not this the main question that was raised by the critics of the EC's guidelines – the newspaper editors and others who challenged them? Why did the honourable judges choose to ignore this question when delivering the judgment? It is an important issue, since it involves a conflict between two sets of rights. On the one hand, the media claim the right to publicise views expressed to their newsmen by the voters coming out after casting their votes – a seemingly legitimate claim under the Constitution. On the other hand, the EC is apparently insisting on its right to maintain the purity of the electoral process – which it feels may get unduly influenced by exit poll surveys. Since the Lok Sabha

elections are being held in a phased manner, in different regions and over a two-month (September-October) period, publication of exit-poll results from one group of constituencies can influence the voting pattern of another group where elections are to be held later. Did the apex court take into account this possibility when delivering its judgment?

Secondly, the Supreme Court judgment has admonished the EC for issuing guidelines without having any power to enforce them. According to newspaper reports, the judges persistently asked the EC's counsel how it could have issued the order of banning the publication and telecast of opinion and exit polls without thinking about its enforcement. Addressing the EC, they were reported to have said: "Your guideline will remain a guideline. It is not binding." Cannot the same thing be said about many Supreme Court judgments? India's apex court has passed some landmark judgments setting down guidelines for protecting the rights of the citizens, particularly the underprivileged. We have heard verdicts of eminent judges directing the government to implement laws to ensure minimum wages for workers, put an end to abominable practices like bonded labour, child marriage and trafficking in human beings among other things, and protect the environment from industrial pollution. Has the Supreme Court been able to get these guidelines enforced? Whether it is the landlords in the remote villages, or the contractors in the urban areas, or the industrialists running factories – all regularly flout with impunity the guidelines laid down by the Court. Surely, the learned judges cannot be unaware of these happenings, since newspapers carry reports which describe how their judgments are being violated.

It is precisely because the EC lacks the enforcing powers that it approached the Supreme Court, hoping that the apex body would make its recommendations legally binding on the media. One could, of course, debate over the merits of the EC's recommendations. But one is a bit surprised by the grounds mentioned by Supreme Court for dismissing the EC's plea. The honourable judges presiding over the Constitution bench were reported to have said: "Even, if we direct the centre to enforce these guidelines, how will the centre impose them?" Do court judgments then have to be determined by the centre's capacity or incapacity to implement them, instead of the merits of the case?

AID

Impact of Sanctions

THAT sanctions have become a major tool of foreign policy and are resorted to by various countries, particularly the developed ones, in pursuit of their policy

objectives is well known. Usually sanctions are meant to penalise targeted countries for actions that adversely affect the security or economic interests of the countries imposing sanctions. Often international institutions, particularly those which the sanction-imposing countries dominate, are also involved in the implementation of sanctions. This is precisely what happened to India and Pakistan after they conducted nuclear tests in May 1998, as becomes clear from the latest Annual Report of the World Bank. Sanctions were imposed on both by eight developed countries led by the US and also through multilateral institutions. Thus the World Bank group's lending in fiscal 1999 sanctioned to India was cut to \$ 1.05 bn in fiscal 1998. The Bank's lending to Pakistan came down from \$ 808 mn to \$ 404 mn correspondingly.

According to the World Bank, consideration of lending for several projects in India was postponed because they were "deemed not to address basic minimum needs". In Pakistan's case, however, because of its "precarious financial situation and its commitment to serious reform", a structural adjustment loan was approved in January this year. Also there is said to be some easing of sanctions lately on India, enabling resumption of loans for power programmes and IFC operations.

The World Bank blames nuclear-related sanctions against India in addition to the country's political instability for its economic slow-down as reflected in the decline in its growth rate. The Indian finance minister may not subscribe to the World Bank's diagnosis in regard to the role of sanctions in the economic slow-down in the country. The fact remains, however, that the sanctions did bring down substantially the World Bank group's loan approvals. This is probably true also of loan approvals by the Asian Development Bank. Since loan approvals in one year take time to materialise as actual lending which may take years, it is possible for Yeshwant Sinha to cite facts and figures to show that not to speak of economic activity, even the inflow of funds has not been immediately affected. But that such inflow is bound to be adversely affected a year or two later goes without saying.

Further, sanctions are imposed against a targeted country with the objective of penalising it for such of its actions as the sanction-imposing countries disapprove of. Of course, it is only natural for the latter group of countries to ensure that regardless of whether sanctions are imposed individually or collectively, their own interests are harmed the least, while penalising the targeted country to the maximum. This is so when sanctions are decided against either technology transfers or financial flows.

CURRENT STATISTICS

EPW Research Foundation

Public sector banks' gross NPAs are 16 per cent of their gross advances and net NPAs, after taking account of provision made for advances considered irrecoverable, 8.2 per cent. Among public sector banks, the nationalised banks have higher NPAs than the SBI. Priority sector advances show higher NPAs than other advances. While the NPA situation has improved somewhat in recent years, against the backdrop of growing sickness among firms the prospects are far from reassuring.

EXIDE INDUSTRIES

Higher Market Share

EXIDE INDUSTRIES (EXIDE), the country's largest storage battery manufacturer, saw a sharp increase of 45.8 per cent in net sales in 1998-99. The acquisition of Standard Industries, another battery manufacturer, has given Exide command over more than four-fifths of the automotive battery market in India. However, the rise in market share apart, there has been a sharp increase in sales in terms of volume too. While the company's installed capacity moved up by 22.9 per cent, sale of storage batteries rose by 43.4 per cent from 36,76,535 units to 52,70,383 units during the year under review. The company's performance is significant, considering that the automobile industry itself has seen a negative growth rate during this period. A major reason for the increase in sales is that most of the new entrants into the automobile sector source their battery requirements from the company. These included Honda City, Hyundai Santro, Mitsubishi Lancer, Daewoo Matiz and Tata Indica.

In addition to the above, a major part of the company's growth came from its industrial and motorcycle batteries divisions. In fact, the latter managed to attain the number one position in the market with a growth of 38 per cent.

What made matters even easier for Exide was that the price of its main raw material, lead, fluctuated on a narrow band, and thus there was no major increase in material costs during the year.

Meanwhile, for the quarter ended June 1999, Exide has notched up a further 18.6 per cent increase in net sales as compared to the corresponding period last year. Net profit too increased by 19.5 per cent to Rs 6.5 crore during the same period. Depreciation rose sharply by 28.5 per cent following the commissioning of the new plant at Hosur, Tamil Nadu, and the acquisition of Standard Batteries during the previous year.

Though the company has performed well and expects to cross the Rs 1,000 crore mark in terms of gross sales in 1999-2000, it needs to guard against a few factors. Firstly, with import of batteries being placed on Open General Licence (OGL), competition is expected to increase in the replacement market where Exide has a strong position currently. Moreover, the import content in the company's raw material, which is already high, has in-

creased from 53.5 per cent in 1997-98 to 56.9 per cent in 1998-99. Though lead prices were relatively stable in 1998-99, this may not be true in the current year.

The company now plans to embark on a Rs 70 crore modernisation programme at its three plants in order to reduce costs and become more competitive vis-a-vis other players like Amara Raja Batteries. The modernisation programme comes at a time when APC of the US, a leading player in the global UPS (uninterrupted power supply) market, reportedly plans to source all its requirements for batteries from Exide. In fact, the American company has already placed an order of 40,000 such batteries per month and is interested in entering into an agreement with Exide. The latter, however, has decided to first put the supply logistics in place before entering into a long-term supply agreement.

Exide is also expected to launch at least four new products in 1999-2000, which will cut across all categories of batteries produced by the company.

The company's shares presently quote at around Rs 274 on the bourses, discounting its 1998-99 earnings by a comfortable 25.3 times, thus reflecting the high investor fancy for the scrip.

INDIAN HOTELS

Corporate Restructuring

A drop in foreign tourist arrivals affected the performance of Tata group company Indian Hotels in 1998-99. This was mainly due to the impact of an economic slow down, as the hospitality industry is usually one of the first to be affected. Room occupancies were under pressure, particularly in the luxury segment.

While income from operations declined by 1.1 per cent over 1997-98, the company's operating profit fell by 2.8 per cent over the same period. Though interest expenses and tax provision were lower by 8 per cent and 3.9 per cent, respectively, an additional provision for tax provision in respect of earlier years amounting to Rs 10 crore led to a drastic fall in the company's bottom line (lower by 13.6 per cent). In spite of earnings per share diving from Rs 30.6 to Rs 26.4, the company decided to maintain the dividend rate at last year's level of 85 per cent.

Keeping in view its poor performance, Indian Hotels undertook a major corporate restructuring exercise during the year under review. Under this programme, the company's operations were regrouped

under five strategic business units (SBUs), namely, Luxury Hotels division, Leisure Hotels division, Business Hotels division, Air Catering Services and the International Operations division. All the hotels forming part of the Taj group, which the company manages, across the country and outside have been grouped under the different business units with a focus on the customer for each segment. All these segments are supported by strong central groups such as sales and marketing, finance, projects, operational standards, legal affairs, etc. According to the company, the new structure is not only expected to impart greater dynamism and customer focus across the Taj group of hotels, but also enhance customer satisfaction and improve profitability of the company on the whole.

Meanwhile, Indian Hotels recently entered into an agreement with Pune Industrial Hotels for the purchase of Blue Diamond Hotel, Pune, and Hotel City Inn, Baramati. Both hotels can be classified as business hotels and renovation work is expected to begin this month. While Blue Diamond Hotel is a 120-room 5-star unit located between the airport and city centre, Hotel City Inn is a 34-room unit meant for business travellers. Until the agreement is formalised, the Kirloskars (original owners) will continue to manage and operate these hotels.

In another move, the Taj group's St James Court Hotel, the favoured London haunt of Indian politicians and businessmen, will get a new name and become part of an international hotel chain soon. Though Indian Hotels will continue to run the 370-room hotel, it will hand over key functions, including marketing, sales and public relations, to the giant Crowne Plaza chain. The company's decision to become part of this chain comes at a time when it is looking closely at its international properties which have been producing indifferent returns for several years. The St James Court has just about been breaking even.

The situation has not improved in the current year, with increased competition and a further drop in foreign tourist arrivals.

IPCA LABORATORIES

Export Growth

IPCA Laboratories (IPCA) has been in the news in the past for its Bachchan connection. In 1998-99 while the company's net sales rose by 15.2 per cent over the

NA: means not available.

previous year operating profit increased by 26.6 per cent. However, the rise in the company's bottom line was restricted to 10.1 percent following a payment of Rs 3.2 crore towards a voluntary retirement scheme implemented during the year. Moreover, there was a sharp rise in interest (up 21 per cent) and depreciation (higher by 15.3 per cent).

A significant part of the company's turnover comes from anti-materials, while almost half of its formulations are based on price-controlled drugs. Tablets/capsules account for 44 per cent of the company's turnover. Basic drugs/intermediates bring in another 33 per cent, while orals/liquids and injectables contribute 12 per cent and 9 per cent of total sales, respectively.

During the year, the company consolidated its presence in the bulk drugs and drug intermediates market in the US and Europe. The company's export growth has occurred despite a slow down in international trade due to the south-east Asian and Russian turmoil.

Meanwhile, for the first three months of 1999-2000, the company's sales and income from operations increased marginally by 1 per cent over the corresponding period last year. While financial cost declined by 14.8 per cent, depreciation was higher by 20.3 per cent over the same period. Net profit improved by 15.1 per cent to Rs 7.9 crore as compared to Rs 6.82 crore in the first three months of the previous year.

The company's stock presently quotes at around Rs 154 on the bourses, discounting its 1998-99 earnings by 9 times.

Larsen & Toubro

Engineering conglomerate Larsen & Toubro (L&T) has performed well in the first quarter of 1999-2000. While net profit improved by 10 per cent over the corresponding period last year, the company's net sales were higher by 8.3 per cent. This was despite a sharp increase in interest charges (up 133 per cent) following the commencement of commercial operations of the company's cement plant at Awarpur in Maharashtra and also due to the increased level of activities. While depreciation increased marginally, provision for tax was higher by 20 per cent. L&T's order book position for the quarter stood at Rs 2,257 crore, indicating an increase of 4 per cent over the same period last year. The total order backlog for the company at the end of June 1999 was Rs 6,563 crore.

Globalisation and National Politics

D N Ghosh

Economic globalisation creates pressures as well as opportunities for all economies and it is for the political class in each polity to spot the opportunities and learn to mould the pressures to serve the particular country's needs and interests.

IN the process of transition from feudalism to capitalism, the 'satanic mill' of the uncontrolled market mechanism, as Karl Polanyi analysed it in his *The Great Transformation*, was wrecking the relationships between economy and society. Society was emerging as an adjunct of the market, with social relations getting embedded in the economic system. The process of globalisation has reactivated the 'satanic mill' with ferocious intensity. The pursuit of economic efficiency with the combination of an unceasing stream of new technologies and unfettered market competition has relegated to the background the social costs of such growth: fractured social institutions, anarchy and uncertainty.

Writing as a political scientist, from the vantage point of a former supporter of the New Right, John Gray highlights, in a passionate polemic,* the dehumanising social impact of laissez-faire in a globally integrated economy. Globalisation has been characterised by him as the great American project, holding the key to future global prosperity. As the world's dominant political and military power and home of the world's largest MNCs, the US engineers the forces of globalisation and displays missionary zeal to spread it across the globe.

UK, New Zealand and Mexico are selected by Gray for special case studies. These countries set about harnessing the explosive potential of technology and the vast resources of MNCs but had to pay a very heavy price. The unleashed free market has destroyed the stability of post-war welfare capitalism and undermined social cohesion, sweeping away the family, proletarianising the middle classes, weakening intermediary institutions and associations, and contributing to "an astonishing growth of economic inequalities of all kinds". Neither the US nor the western world has escaped from these perverse social consequences which Gray

lays at the door of globalisation. An ever-widening list of countries are falling victim to the delusion that globalisation would usher in a new dawn. The misery of a few of these has been documented by even the staunchest advocates of globalisation. No country is anywhere near the paradigm of the 'post-historical' society which Fukuyama spoke of.

With powerful rhetoric Gray pleads for a regime of global governance for emancipation from agony and anarchy associated with global free marketism. An international order may bring some measure of public governance over private power, but this is a distant utopian dream. Such a regime could only be established by the world's great economic powers acting in concert, with the US providing the leadership. With her global reach over enterprises and markets in other countries, the US would prefer to assert herself through controlled interventionism and enforcement of standards and regulations consistent with her interests. The world economy can function only so long as its institutions are underwritten by an effective global power and the US fulfils this role admirably. She owes it to the world, as Lester Thurow argues in his book *Future of Capitalism*, to keep herself fully strengthened all the time to act as its policeman to prevent global anarchy.

Globalisation is an open-ended process influenced continually by tectonic forces and developments in the areas of technology and communication and affecting different economies in different ways, reordering modes of production and relationships within different polities. It is not an unmitigated curse, "a turn in the history of servitude" as Gray characterises it, nor is it endowed with a 'human face' needing a bit of "cosmetic surgery on one cheek and a trinket in an ear" as Jagdish Bhagwati puts it in a recent column in *The Financial Times* ('Cheap Liberal Talk', August 17, 1999). Those who believe in the 'Washington consensus' and those who decry it as the 'American project' swing between

the hallucinatory visions of a free unfettered market and the horrors of regulation evils. Economic globalisation creates pressures as well as opportunities for all economies and it is for the political class in each polity to spot the opportunities and learn to mould the pressures to serve its own country's needs and interests.

Admittedly MNCs, the standard bearers of globalisation, have their own agenda; they look for a borderless world, an indispensable sine qua non for their continued expansion, growth and diversification. Their interest lies in breaking down the political boundaries of states and converting the ruling political class in each to their way of thinking. They have to resort to multifarious stratagems, some subtle, some brazen, but all with the sole objective of persuading the ruling political class that globalisation he viewed as the technical prerequisite of economic growth. MNCs bring new technologies, innovative products and sophisticated management practices and create strong pressures for supportive policies for a certain kind of deregulation and privatisation for their uninterrupted working. What is crucial for their agenda is the delinking of politics from the economy, a change in the nature of the political process itself. In many poor and developing countries, the ruling political class surrenders to such pressure and rationalises the loss of national control over the economy and the legitimacy of the political regime in the name of national interest. Political stability, for those economic agents active in a global environment, comes to signify the continuation in power of those interest groups in the politics who accept as inevitable the increasingly widening gap between formal and effective sovereignty in the management of their national economies.

The nature and character of the political class is of decisive significance in countering the consequences of free market policies and at the same time creating conditions for technological and economic transformation of the national economies. Even Gray, for all his anti-American rhetoric, concedes that "no political reaction against the consequences of free-market policies will be effective that does not grasp the need for technological and economic transformations" that globalisation can and is able to harness. Some of the social evils and economic deficiencies which evoke raging passions are attributable not to globalisation but to inadequa-

* *False Dawn: The Delusions of Global Capitalism* by John Gray, Granta Books, London, 1998.

cies and deficiencies internal to the polities. These have to be accepted candidly and transparently by the political class. It is not free markets that have caused the crisis of the welfare state but internal weaknesses and deficiencies which have bred self-perpetuating interest groups. Nationalist rhetoric and ideology have become the rallying point for those interest groups who rush to find foreign scapegoats to blame for their own impotence. Dominant interests and institutions which have stakes in old intellectual obsolescence look for ways to shield themselves from change: they do not like being shaken out of cosy comfort, the privilege of enjoying the umbrella of political patronage is too dear for them. All these are hallmarks of a polity whose horizons are limited and is seen to love and embrace stagnation as a way of life.

The political class has to assume necessary moral authority and leadership. It must know how to discipline itself and also accept the responsibility of persuad-

ing the entrenched domestic interest groups to change their focus to fulfil their roles and expectations in a globally integrated economy. It cannot abdicate its responsibility under cover of nationalistic or ideological rhetoric. It has to find ways of creating and nurturing an ambience for responsible and enlightened political activity and resolving the antinomy between polity and economy, between the logic of global expansion of economies and the socio-economic compulsions within national boundaries in the interests of the polity. This dilemma cannot be resolved within a system of fixed beliefs and a set of precise goals, nor within the parameters of any ideological framework, where everything is known, determined and certain. In politics torn between the increasingly undeniable dependence on an internationalised economy and the desire to control their collective fate, global interdependence can be made to turn to national advantage only through a process of adaptive and flexible political activity.

the WTO calling for agreement among the member countries to permanently put a moratorium on customs duty on electronic transmissions. However, due to lack of unanimous support in the subsequent G8 meeting, the US proposal could not be adopted in the Second WTO Ministerial Conference held in May 1998 at Geneva. Nevertheless, a Declaration on Global Electronic Commerce was adopted by the ministers under which it was agreed to continue the duty free status of electronic transmissions for one year only subject to automatic review thereafter. The Declaration also authorised the General Council of the WTO to establish a comprehensive work programme to examine all trade-related issues relating to global e-commerce, taking into account the economic, financial and development needs of developing countries. Accordingly, the General Council of the WTO established a Work Programme on e-commerce on September 25, 1998.

WTO WORK PROGRAMME

The Work Programme broadly defines the term 'electronic commerce' to mean production, distribution, marketing, sale or delivery of goods and services by electronic means and to include not only examination of all these aspects of e-commerce but also specifically examination of issues relating to the development of infrastructure for e-commerce. Under the programme, the General Council of the WTO itself is required to examine trade related issues of a cross-cutting nature as also all aspects concerning the imposition of customs duties on electronic transmissions. There are a number of other specific issues which, however, have been assigned under the programme to various WTO bodies. Though these are described in the related WTO document, it may not be out of place to outline the same here in some detail to enable the readers to appreciate the wide scope and coverage of the Work Programme on the one hand and the complexities of issues involved on the other. It goes without saying that these issues need to be addressed properly before member countries can decide to enter into any binding obligation. The issues were assigned to various WTO bodies as follows:-

(1) Council for Trade in Services

The Council for Trade in Services shall examine and report on the treatment of electronic commerce in the General Agreement on Trade in Services (GATS) legal framework. The issues to be examined shall include:

COMMENTARY

WTO Work Programme on Electronic Commerce

A Developing Country Perspective

C Satapathy

Electronic commerce is an area where, at the present stage of its development, there are many more questions than answers. Before entering into future binding obligations in this area, the developing countries, including India, need to carefully consider the implications of such commitments.

DURING a purely informal discussion, a high ranking WTO official once wondered aloud as to whether all member countries really understood the full implications of proposals they were called upon to accept. He went on to suggest that no member country should contract a future binding obligation without knowing what it applies to. Though the suggestion was made on condition of strict anonymity, it was a very valuable suggestion based on years of experience of witnessing a large number of multilateral negotiations from a position of neutrality and objectivity. Particularly the developing countries, with rather limited resources and smaller delegations, may not often be in a position to analyse and understand the implications

of what they are being asked to agree to at multilateral negotiating tables. Electronic commerce is especially such an area where at the present stage of its development "there are many more questions than answers". As such, before entering into any future binding obligations in the area of e-commerce, the developing countries need to be even more cautious regarding the implications of such obligations.

Initially, the US and EU had reached an agreement on December 5, 1997 to work towards a global understanding to continue the "current practices not to impose duties on electronic transmissions". Subsequently on February 19, 1998, the US had presented a market access proposal to

- scope (including modes of supply) (Article I);
- MFN (Article II);
- transparency (Article III);
- increasing participation of developing countries (Article IV);
- domestic regulation, standards, and recognition (Articles VI and VII);
- competition (Articles VIII and IX);
- protection of privacy and public morals and the prevention of fraud (Article XIV);
- market-access commitments on electronic supply of services (including commitments on basic and value added telecommunications services and on distribution services) (Article XVI);
- national treatment (Article XVII);
- customs duties;
- classification issues.

(2) Council for Trade in Goods

The Council for Trade in Goods shall examine and report on aspects of electronic commerce relevant to the provisions of GATT 1994, the multilateral trade agreements covered under Annex 1A of the WTO Agreement, and the approved Work Programme. The issues to be examined shall include:

- market access for and access to products related to electronic commerce;
- valuation issues arising from the application of the Agreement on Implementation of Article VII of the GATT 1994;
- issues arising from the application of the Agreement on Import Licensing Procedures;
- customs duties and other duties and charges as defined under Article II of GATT 1994;
- standards in relation to electronic commerce;
- rules of origin issues;
- classification issues.

(3) Council for TRIPS

The Council for TRIPS shall examine and report on the intellectual property issues arising in connection with electronic commerce. The issues to be examined shall include:

- protection and enforcement of copyright and related rights;
- protection and enforcement of trademarks;
- new technologies and access to technology.

(4) Committee for Trade and Development

The Committee on Trade and Development shall examine and report on the development implications of electronic

commerce, taking into account the economic, financial and development needs of developing countries. The issues to be examined shall include:

- effects of electronic commerce on the trade and economic prospects of developing countries, notably of their small and medium-sized enterprises (SMEs) and means of maximising possible benefits accruing to them;
- challenges to and ways of enhancing the participation of developing countries in electronic commerce, in particular as exporters of electronically delivered products; role of improved access to infrastructure and transfer of technology, and of movement of natural persons;
- use of information technology in the integration of developing countries in the multilateral trading system;
- implications for developing countries of the possible impact of electronic commerce on the traditional means of distribution of physical goods;
- financial implications of electronic commerce for developing countries.

It may be seen from the above listing that the issues identified under the WTO Work Programme on e-commerce are wide ranging and raise many questions in relation to this new but rapidly growing mode of commerce. The reach of the agenda under the WTO Work Programme also goes far beyond the initial US-driven proposal to impose a permanent moratorium on customs duty on electronic transmissions, though the US proposal no doubt remains the core issue for consideration.

IMPLICATIONS OF US PROPOSAL

The OECD report titled 'The Economic and Social Impact of Electronic Commerce' examines some of the relevant issues in the context of the future of e-commerce. It notes that continuing US dominance in the sphere of electronic commerce in the global market is creating competitive concerns and suspicions in other countries. The OECD report points out that out of the estimated \$ 26 billion electronic commerce last year, four-fifths are attributable to the US. This disproportionately high US market-share is not likely to reduce beyond two-thirds of the total expected market worth \$ 1000 billion in the year 2005. It also notes that the US lead reflects lack of growth of the market in Europe and Asia caused by high costs, consumer attitudes and barriers to competition. Slow development of e-commerce in Europe and Asia are also attributed to high telecommunication cost, slow liberalisation and insufficient transmis-

sion band width. The US consumers are more used to distance shopping on account of being used to mail order sales. The OECD report doubts that e-commerce will replace traditional forms of retailing. E-commerce is likely to be more pronounced in dealings between one business and another rather than in retail transactions involving consumers. At the most, it may become another channel for retailers like mail order rather than a new dominant mode of commerce. The report finds little evidence that products sold on the Internet are cheaper. It goes on to say that e-commerce is expected to cut distribution costs by 5 per cent and yield efficiency gains of 0.75 per cent of GDP, but these savings could lead to low consumer prices only if there was significant competition.

These findings leave one in no doubt as to why acceptance of the US proposal to put a permanent moratorium on customs duty on electronic transmissions worldwide is going to primarily benefit e-business originating from the US to the largest extent both in the short and the medium run. This is of course no argument for other countries not to develop their market share of e-commerce. It was argued in an earlier paper¹ that with adequate legal framework in place and rapid technological advances in the field of secure electronic transmissions, global e-commerce is destined to grow in leaps and bounds and create new opportunities for trade in future which no nation can afford to miss. Every country needs to have the necessary technological infrastructure in addition to the legal framework for facilitating electronic commerce, preventing computer misuse and ensuring data protection to be able to take advantage of growth opportunities in the area of e-commerce. There is absolutely no dispute that every country, whether developing or developed, has to set its house in order to quickly grab the new opportunities and become a prominent player in the fast growing arena of e-commerce.

However, when it comes to undertaking any binding obligation every country must ask the necessary questions as to what are the short-term and long-term implications of such obligations. Moreover, each country must bargain for securing maximum advantage for its national trade before binding itself to some obligations that provide greater market access to others. It is in this context that the core proposal of the US in the area of e-commerce is worth examining in some detail as also some of the other important issues relating to e-commerce.

On the face of it, the US proposal looks straightforward and asks the member countries to agree to continuing indefinitely their current practice of not imposing customs duty on electronic transmissions. The proposal, however, has several implications which need deeper analysis. It is not at all clear what is sought to be covered under the phrase 'electronic transmissions'. It is significant that the US proposal is not limited to not imposing customs duties on 'goods' traded digitally. Does it, therefore, imply a wider coverage than 'goods' and include 'services' as well? In fact, a legitimate doubt regarding classification has arisen in the context of electronic transmissions of the content of books, audio CDs, films, computer software, etc. These products, when delivered on physical media, have all along been classified as goods and charged to customs duty or exempted from it depending on the prevalent tariff at national borders of respective member countries. However, these products are now capable of being digitalised and transmitted through the Internet. Some argue that since these products are like goods, the corresponding electronic transmissions should be classified as goods, but many others may not agree to this proposition and the classification issue for customs duty purposes for these products remains far from settled. There is, however, no doubt that various other products which are not in the nature of goods but are clearly 'services' can easily be transmitted in digitalised form. Examples include legal advice, medical opinion, travel tickets, financial services, telecommunication services and a host of others.

Generally, customs duties are imposed on goods at the international border and one may be misled to believe that the US proposal is limited to exempting customs duties on only such electronic transmissions which can be classified as goods, but one suspects this may not be so. There are instances of imposition of customs duty on services and products whose classification as goods is not undisputed. Electricity is one such product, which may not be strictly classifiable as goods, but has been subject to customs and excise duty in the past either at the time of import or at the time of production. The US itself charges customs duty on ship repair charges, based on the extent of value added, when a ship arrives at US port after being repaired at a foreign destination. Some view such a levy to be in the nature of customs duty on services and not on goods. As such, from the US proposal it cannot be concluded that it is limited to imposing

a moratorium on customs duty only on electronic transmissions that can be classified as goods. It can very well be interpreted to include services.

It is well known that the developed countries have little dependence on customs duties. Bulk of their revenue comes from direct taxes and from domestic taxes such as VAT, etc. Many of these countries impose VAT type of taxes both on goods and services, whether domestically produced or imported. On the other hand, the developing countries are more dependent on revenue from customs duty, particularly import duties. A moratorium of the kind proposed by the US which is limited to customs duties alone may allow the developed countries to tax import of goods and services through VAT type of taxes, whereas developing countries would be denied the freedom to levy customs duties on imported goods and services. In effect, such a moratorium will have negligible effect on the revenue sources of the developed countries but will secure duty free market access to their products in the developing countries.

In times to come, developing countries would have to progressively impose taxes on services if they do not already have a VAT system of taxation. Normally, in respect of goods, an additional duty of customs is levied on imports at the same rate as the duty on domestic production. In the case of import of services, unless a similar customs duty equal to domestic service tax is imposed, domestically produced services are likely to suffer a tax disadvantage. By agreeing to the US proposal, developing countries will have to give up the option of imposing customs duty on services imported through electronic transmissions.

Moreover, tax systems as well as various WTO agreements dealing with goods and services are required to be technology neutral. Tax exemptions cannot be given to a product merely because it is delivered through a particular mode of transport. The US proposal is found wanting against this general principle. It seeks to exempt electronic transmissions from duties which will create tax inequity against similar products delivered in physical form. Such a proposal, if accepted, would create a bias in favour of electronic delivery and cause diversion of trade to the electronic mode. While this may increase the volume of e-commerce significantly as projected in various studies, it will reduce the tax-base apart from resulting in inequity. Though the diversion of trade in products such as books, audio CDs, films, software, etc. may not result in erosion of the tax base

significantly, the tax base is bound to be reduced to a very great extent if services transmitted electronically are also exempted from duty, considering the projection of explosive growth of e-commerce encompassing trade in services. Member countries who are looking for newer sources of revenue in the services sector need to worry about this aspect.

The proposal of the US for a moratorium on customs duty indefinitely into the future also needs to be examined in depth. There is no doubt that the present state of technology makes it difficult for taxing authorities to levy and collect duty on electronically delivered products. Apart from the difficulty in classifying electronically delivered products, there are questions regarding place and time of sale, location of the tax payer, jurisdiction of taxing authorities, etc. which have no satisfactory answers at the present time. A moratorium on taxing such products would merely avoid these questions, but on that ground alone indefinite moratorium on taxes for all time to come may not be warranted. Human ingenuity and technological advances may offer solutions to some of these questions in the future. It is significant that the much talked about recent US legislation, namely the Internet Tax Freedom Act, provides for only a three-year moratorium on e-commerce tax. It is not known why the US is pushing for an indefinite tax moratorium at the WTO forum when domestically it is happy with a mere three-year tax moratorium. Moreover, the Internet Tax Freedom Act of the US also allows taxation of Internet access if such taxes were generally imposed and actually enforced prior to October 1998.

A federal Advisory Commission on Electronic Commerce has also been set up in the US "to think up good reasons to tax electronic commerce". Governor Michael Levitt who is on the commission argues that e-commerce is siphoning state sales tax revenue. The commission is required to address the issues related to Internet taxation and send their recommendations to the US Congress by April 2000². A study conducted by Ernst and Young estimates that \$170 million taxes were not collected on Internet sales in US in 1998. To arrive at this low figure, they had excluded 80 per cent e-commerce which were between businesses and hence not taxable, 63 per cent of household sales which involved intangibles such as travel and financial services or exempted products such as groceries and 60 per cent of taxable sales which were substitutes for purchases from mail-order or tele-market-

ers that did not pay taxes anyway. The study is believed to underplay the loss of taxes in Internet sales. However, in a significant statement Joseph Crosby of Ernst and Young has said that taxes on electronic commerce would clearly be needed eventually to level the field³. The OECD ministerial conference of October 1998 had also reached agreement that indirect taxes on e-commerce should be levied on the basis of where they were consumed though there was yet no agreement on definition of 'place of consumption'. OECD clearly plans to tax Internet commerce.⁴

Since most of the developed countries have either nil or very low customs duties on imports, agreeing to a moratorium on customs duties on electronic transmissions is not going to give any further advantage to the developing countries. It is the developed countries who are going to gain greater market access by such a measure. Before considering such a moratorium, the developing countries should at least bargain for a regime under which their software and other services transmitted digitally are not subjected to domestic levies like VAT, etc. on import at the other end. They also need to protect their future right to levy duty and taxes on e-commerce when it becomes technologically feasible.

THE DIGITAL DIVIDE

Before one looks at the specific issues under examination by different WTO councils and committees, it is worthwhile to reflect upon another general issue. It concerns what the US Department of Commerce itself calls the 'digital divide'. Victoria Shanon writing about her near-netless experience in a farmhouse at Lauzerte in southwest of France, where she temporarily became an Internet have-not, wonders "how people in the hinterlands – often without reliable phone systems, modem-equipped computers, or money even – were going to be able to reap the rewards of a wired world".⁵ Citing reports of US Department of Commerce, Victoria Shanon says that the digital divide is significantly widening between the white and black population, between the rich and the poor, between the urban and the rural (even at the same income level) and between higher and lower educational levels. US Commerce Secretary William Daley writes in the report that "we should not only care, but we should be alarmed by this news". The digital divide is obviously going to be even wider when we think of the have-nots in the developing world. Some thought, therefore, needs to

be given to the question as to who is going to benefit and how much from the growth in e-commerce, notwithstanding the numerous claims and assumptions that e-commerce would put small and medium enterprises at par with the largest and hasten the pace of development.

The 1999 Human Development Report states that with less than 5 per cent of world population, the US has more computers than the rest of the world combined. It also has 26 per cent of the world's Internet users compared to 1 per cent in South Asia with 20 per cent of the world's population. The report calls for a tax on information sent through the Internet so that the proceeds can be used for providing expensive equipments in poorer countries.⁶ The suggestion could not have come at a more inappropriate time for the US with its proposal for a duty-free environment for all electronic transmissions pending at the WTO.

It is not anyone's case that Internet or e-commerce is the cause of the digital divide. It is natural that the use of the Internet is highest among the urban, affluent and educated in the more developed economies. They also have access to more advanced computers and telecommunication services at a lesser cost. And many in the less developed world, who are privileged and can afford the technology, are also in the club. Joe Rogaly speaks of "a global crust, a topping that unites the affluent, wired, literate elite of our species, while leaving the rest of the population where it always was, at the bottom".⁷ That may be a drastic viewpoint, but the fact remains that the capacity of developing countries in particular to participate in e-commerce depends on a well functioning and modern telecom infrastructure, satisfactory supply of electrical power, access to hardware, software, servers, access to telecommunications at low prices, etc. as has been pointed out by the WTO Secretariat itself.⁸

ISSUES BEFORE WTO COUNCILS AND COMMITTEES

There are a number of issues the General Council of WTO as well as the Council for Trade in Services, Council for Trade in Goods, Council for TRIPS and Committee on Trade and Development have to resolve under the Work Programme on e-commerce.

As far as the Council for Trade in Services is concerned, it has to deal with a number of issues. While it is the general view that all electronically delivered services will be subject to the discipline of GATS, there is no common understanding among the

WTO members that all electronically delivered products should be classified as services. Similarly, there is no common understanding as to whether customs duties can be applied to services or not. Some WTO members are keen that irrespective of their classification as goods or services, all electronic transmissions should be made duty free for all time to come. They are also not prepared to discuss the impact of domestic taxation on e-commerce as such taxes would fall outside the purview of WTO negotiations. But these are important questions and definite answers are required as to whether electronically delivered products are goods or services, and whether services can be charged to customs duties especially if the developed countries are charging such services to comprehensive VAT, sales tax, etc. under their domestic tax laws.

From the perspective of developing countries, the issue of enabling them to effectively participate in e-commerce through liberalisation of market access is equally important in the context of Article IV of GATS. They need to have better access to technology relating to telecommunication, encryption and secure transactions. Some countries have restricted export of state-of-the-art encryption technology to the detriment of the interests of developing countries. Development of physical infrastructure and human resources as well as assessment of revenue and other fiscal implications of e-commerce for the developing countries need special attention.

Whether application of competitive safeguards and access to and use of public telecommunication networks can be automatically extended to Internet related services are also of importance since the Internet includes both public and private networks in its ambit.

As far as the Council for Trade in Goods is concerned, it is also concerned with the classification of electronically delivered products as goods and the question of extending duty-free treatment to such products. It is clearly in the interest of the developing countries not to agree to an indefinite moratorium on customs duty on electronic transmissions till a clear picture emerges regarding classification of such products and till it also becomes clear how such products are going to be treated for tax purposes in the developed countries. A temporary moratorium may, therefore, be desirable at this juncture till such issues are settled and till a way is found to levy duty and taxes on such products.

There are additional questions relating to customs valuation, licensing, origin

determination and exchange control in relation to not only goods delivered electronically but also in relation to goods delivered physically but ordered and paid for electronically. The state agencies need to know the details of payments made and not solely depend on the buyer voluntarily disclosing the payment details, paying duties and subjecting himself to various regulations. Even in the US, few consumers pay the appropriate tax voluntarily on \$93 billion mail-order catalogue sales.

Developing countries with exchange control mechanisms in place would also have to devise ways of allowing electronic money transfers to facilitate electronic purchases and yet maintain controls in place. Specification of standards in relation to e-commerce and determination of jurisdiction in which a consumer can get relief in the event of receipt of a sub-standard product pose entirely different issues. A recent ruling by the New York City Supreme Court has increased concern for all e-commerce businesses which now face potential law suits in any area from which their web sites can be accessed.⁹ A proposed revision to the EU Convention which would allow a consumer to sue a supplier company in the consumer's home country has also attracted lot of criticism. WTO is perhaps the right forum to work out a way of protecting the interests of distantly located consumers without making e-commerce difficult for small and medium enterprises.

The Council for TRIPS is concerned with essentially three areas – copyright, trademark and access to technology. However, it appears to be totally dependent on the work done at the WIPO in the first two areas. Ease of replication in the electronic medium poses greater challenges to the world community for protection and enforcement of copyright and trademarks. The WIPO Copyright Treaty and the WIPO Performances and Phonograms Treaty seek to respond to the advances in the information and communication technologies on the creation, production and use of literary and artistic work, performances and phonograms. Work is also going on at WIPO on the protection of audio-visual performances, databases, rights of broadcasting organisations and management of copyright and related rights in the digital environment. WIPO has also recently produced a report titled 'The Management of Internet Names and Addresses: Intellectual Property Issues' and its Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications is working on the use of trademarks on the Internet.

The developing countries are often used by multinational companies to get software, drawing and design work done at a fraction of the cost they would incur in the developed countries. Such work done by 'body shopping' generates enormous revenue for such companies but the amount remitted to the developing countries does not exceed a small percentage over and above the low wage paid to the professionals. The intellectual property right for the product designed also invariably does not remain in the developing countries. WTO forum can perhaps be utilised to ensure not only full remittances for products designed in developing countries but also to secure intellectual property rights for such products to the actual designers in the developing countries.

The Committee on Trade and Development is particularly required to examine the developmental implications of e-commerce and its impact on developing countries. It is recognised that the pace of evolution of e-commerce is beyond the capacity of many developing countries and, therefore, it is a central issue as to how the developing countries, including the least developed, can benefit from e-commerce. Several assumptions are being made in this regard, such as that e-commerce would have positive effects on growth and development by making economic activities efficient and would promote a balanced development of the global economy. Similar assumptions are being made that e-commerce would enhance the participation of developing countries in the multilateral trading system, would empower the less developed countries as it empowers individual consumers and would substitute for the movement of natural persons.

The developing countries suffer from weaknesses in human and physical infrastructure including telecommunications, computer technology, energy and financial resources. Telecommunication facilities including fax and Internet facilities are expensive, unreliable and urban-centred. Developmental assistance including access to technology and training on fair terms as well as foreign investment would be needed to empower developing countries to be able to participate in e-commerce. These issues cannot be resolved by merely agreeing to create a duty-free environment for electronic transmissions.

In addition to the specific issues before different WTO Councils and Committees, the General Council is also required to play a central role under the Work Programme on e-commerce. It is hoped that the General Council will coordinate

the work of the subordinate bodies and pay attention to some of the general issues that require intergovernmental co-operation.

Many believe that e-commerce should be allowed to remain market driven without any bureaucratic controls imposed by national governments. However, since e-commerce operates in a borderless world, there are concerns that there must be suitable national and international laws to facilitate e-commerce by recognising paper equivalence of electronic documents and contracts. There is also need for internationally recognised certification service providers. International co-operation is also necessary for coping up with computer-related frauds such as hacking, malicious falsification or erasure of data, software attacks and software thefts, etc. Similar co-operation is also necessary for ensuring data protection and privacy.

It also needs serious reflection as to whether national governments should merely enact framework laws to facilitate e-commerce and leave the rest to market forces and businesses to self-regulate themselves or there should be governmental intervention to regulate e-commerce to the extent that may enable timely prevention and detection of cyber crimes and frauds. Such frauds may relate to sale and purchase of goods, services and securities etc, or they may even relate to electronic payments, money laundering, economic espionage, national security and spread of material detrimental to public morality, etc. Other issues such as transfer and sale of technology, creation of infrastructure and encryption standards merit serious consideration. There are also questions relating to levels of encryption required for secure electronic transactions necessary for smooth running of businesses on the one hand and the contrasting need of the public authorities to be able to decipher, monitor, detect and prevent criminal activities on the other. These are important issues which also need to be addressed under the WTO Work Programme.

The growth of e-commerce has thrown open so many questions that apart from the WTO, several other international organisations are dealing with various aspects relating to it. For example, UNCITRAL is dealing with legal issues, UNCTAD is dealing with developmental issues, Basle Committee on Banking Supervision is dealing with electronic payment systems, UN/ECE is dealing with trade facilitation issues, WIPO is dealing with intellectual property rights and domain names and ICC is dealing with uniform commercial code. OECD is deal-

ing with taxation matters on its own and in addition, with privacy and security matters in collaboration with AIEPC, with access to infrastructure, telecommunication and issues of inter-operability in collaboration with ITU and with technical standards in collaboration with ISO and ITU. There is need to coordinate the activities of these organizations and the WTO so that there is no duplication of work and the interests of developing countries are taken into account while dealing with different aspects of e-commerce.

Population Growth and Coercive Controls

Case of Injectable Contraceptives

Vineeta Bal
Laxmi Murthy
Vani Subramanian

While policies aimed at controlling population have become marginally more sensitive to people's needs, they continue to ignore serious health and welfare issues, particularly of women. The case of injectable contraceptives, their development, promotion and use, illustrates this.

ACCORDING to estimates of the United Nations Population Division, India's population crossed the one billion mark on August 15, 1999. Sources at the ministry of health and family welfare, however, have projected the 'event' to occur sometime in May 2000. With the United Nations Population Fund (UNFPA) co-ordinating a sustained media campaign, October 12, 1999 has been identified as the day on which world population will cross the six billion mark. The rising panic about the population 'explosion' as the cause of all misery – from poverty to environmental degradation, informs policy-making and public opinion at the national and international level.

International development agencies as well as the government of India (GOI) have consistently implemented top down programmes disguised under different names and schemes. They have been called maternal and child health (MCH)

programme in association with family planning programme (FPP) in the early years, family welfare programme (FWP), integrated child development scheme (ICDS), MCH and nutrition services. In recent years, following the International Conference on Population and Development (Cairo, 1994), the government has been pressured to shift from 'demographic imperatives' to women's reproductive health. Yet, the resultant reproductive and child health (RCH) strategy is yet to result in a paradigm shift away from the target oriented perspective of bringing down numbers.

The percentage of use of spacing methods of contraception is low in India. Sterilisation accounts for more than 70 per cent of contraceptive use. Only about 6 per cent users resort to hormonal contraceptives with less than 10 per cent amongst these (i.e., <1.0 per cent of the total users) using injectable hormonal contraceptives,

and the rest using oral pills [UNFPA 1998]. Over the past two decades the thrust on using provider-controlled, injectable contraceptives is gradually increasing and user-controlled methods like the diaphragm have disappeared from the FWP.

The global picture of use of injectable contraceptives is interesting to note. Except for Indonesia at 15 per cent and Thailand at 12 per cent, the use of injectable contraceptives is very low (3 per cent) in developing countries. By comparison, 36 per cent rely on voluntary female sterilisation, 25 per cent on intrauterine devices (IUDs), 12 per cent on oral contraceptives, 9 per cent on vasectomy and 6 per cent on condoms. In the developed world, where freedom of choice can be maximally executable, barring South Africa and New Zealand, surveys do not mention injectables, or else include them among 'other' methods indicating a very low percentage of usage [Population Reports Series K, No 5, 1995]. Significantly, in South Africa, the proportion of users is high (27 per cent) among the black population as compared to whites (3 per cent).

Against this background some recent events are noteworthy. In December 1998, a high powered meeting on 'Improving Contraceptive Choices in the National Family Welfare Programme' was hosted by the Institute for Research in Reproduction, Mumbai. The agenda was to seek approval to introduce injectable hormonal contraceptives like Net En (chemically known as norethisterone enanthate) and Depo Provera (depot medroxy progesterone acetate) in the National FWP. In addition to the Indian experts, those from several neighbouring countries had been invited to share their views and experiences with injectables. Representatives from several international agencies including WHO, NGOs like Family Planning Association of India and women's organisations were invited. Additionally, the pharmaceutical companies marketing these products in India were also part of the meeting. Representatives from women's groups and health activists though largely outnumbered, managed to raise concerns about the hazardous nature of these injectables, and the inadvisability of their mass use. Despite their protests, the outcome of the meeting was to recommend the introduction of injectables, albeit in a phased manner.

Taking into consideration the available infrastructure at Primary Health Centres, the need for counselling, screening and appropriate back-up for medical intervention, injectable contraceptives should

preferably be introduced selectively in suitably equipped centres and hospitals. It is stressed that the introduction should be gradual and with emphasis on good clinical practice and rigorous post-introduction surveillance of the side effects and patient care [ICMR 1986].

From this cautious recommendation, it is apparent that the apprehensions of women's groups and health activists about introducing injectable contraceptives in the FWP have been acknowledged.

HAZARDS OF HORMONAL INJECTABLE CONTRACEPTIVES¹

Progesterone is one of the female reproductive hormones and its regulated presence along with the hormone oestrogen, is essential for successful pregnancy. Net En and Depo Provera are contraceptives used as depots of progesterone (or its chemical relatives), injected in the woman. The duration of the contraceptive period offered is 2-3 months and a repeat injection is necessary to prolong contraceptive effect. Continuous rather than cyclical or periodic presence of progesterone is one of the major causes for various side-effects and problems associated with the usage of injectable contraceptives. Side-effects of injectables are also related to the fact that a very high dose of hormones is delivered by the injection. In addition, drug accumulation is another factor contributing to the severity of side-effects.

Menstrual chaos, which can take the form of heavy bleeding, spotting, irregular bleeding or a complete absence of bleeding for several months, is the most common and the most unacceptable side-effect of these contraceptives. In the largest clinical trial done by the ICMR on Net En, 43.5 per 100 users had discontinued Net En by the end of two years due to menstrual disturbances and this was the single major cause for drop outs in this study [ICMR 1986]. Menstrual disturbances seriously affect women's lives and contrary to the belief expressed by many men, even the absence of regular menstruation is a cause of great worry for women. Other relatively common side-effects are headache, dizziness, weight change, mood changes, depression, decreased libido – all of which can worsen a woman's sense of well-being and drastically alter her quality of life.

Additionally, there is an increased risk of developing atherosclerosis (thickening of blood vessels), thromboembolism (development of a blood clot at unexpected sites resulting in a heart-attack, stroke, etc), osteoporosis (loss of bone density resulting in increased frequency of bone

fractures), etc. There is also a potential risk of development of cancer, based on the toxicity testing studies in animals. Return of fertility after discontinuing injectables is not immediate or predictable. In fact, in the ICMR study, 26-49 per cent of ex-Net En users in different categories failed to conceive even at the end of one year. The risk to progeny in case of failure of the injectable, or its accidental use has also not been satisfactorily ruled out [Saheli report]. In addition to medical risks, there are certain problems which are peculiar to developing countries like India. ICMR had conducted one of the largest trials on Net En (Phase III trial) in a supervised manner where the best possible conditions are expected to be available. However, the results highlight the problems associated with the use of these drugs when used on a large scale in Indian conditions.

To begin with, the issue of informed consent is a crucial issue. The potential for abuse inherent in injectables is manifested in several ways – when a woman is unaware that she is being injected, or when she is unaware that the injection is a contraceptive, or even when she is unaware of the potential risks and hazards of the drug. The experience of the health camp in Patancheru, Andhra Pradesh in 1985, where women were unaware that they were part of a trial, and had no knowledge of the risks involved, was in fact the impetus which led to several women's groups and individuals filing a public interest litigation in the Supreme Court asking for a stay on the clinical trials of Net En.

ICMR studies (1986) have shown a high rate of failure in the first six months of the trial and this could not be easily explained by ICMR. The rate of discontinuation in the Phase IV trial was also very high in the urban as well as rural settings. Most of these discontinuations took place within the first six months suggesting that lack of counselling might have been a contributory factor for the discontinuation. Almost 90 per cent of the subjects had either excessive bleeding or absence of bleeding (amenorrhoea). Additionally, there was a considerable delay in the return of fertility. Only 50-72 per cent of the women had conceived one year after the discontinuation, with a median time 7.8 months. In contrast, fertility returned faster (average 3.7 months) and in more women (83.6 per cent) discontinuing the IUD.

If these drugs are to be used in the national FWP the problems and potential hazards would increase manifold as health services in small towns and at district level

are almost non-existent in large parts of the country. Inadequate health services would adversely affect screening procedures, proper training in administering injectables, proper monitoring of side-effects as well as dealing with complications or emergencies due to use of injectables.

There has been an attempt to build a consensus around the desirability of injectables. In September 1999 a meeting was organised in Delhi by Pariwar Sewa Sansthan, on the theme of 'Increasing contraceptive choices' with a special focus on injectable contraceptives. Social marketing of injectables and distribution through NGOs was proposed as a more acceptable alternative to mass use through the NFWP. Representatives of women's organisations present at the meeting raised questions about this approach, and also critiqued the inadequate and shoddy data presented on use of Depo Provera which was part of the post-marketing surveillance (PMS) advised by the Drug Controller of India.

If the ideal efficacy rate cannot be achieved, if the range of complications is high, if the delay in the return of fertility is much beyond what has been reported in other studies what are the putative advantages of the injectable contraceptives? The answer lies more squarely in the non-scientific issues. First, according to the population control lobby, population growth is the root cause of poverty and this article will not go in the details of countering the argument here. Secondly, provider controlled methods are easy to use in programme which is focused on bringing down the birth rate. Thirdly, repeated injections provide a better opportunity to the pharmaceutical companies interested in developing technology-oriented methods which fetch more financial benefits. The disadvantages of the injectable contraceptives to the women recipients are not the disadvantages for the population control lobby or for the foreign aid agencies or the governmental machinery.

CAMPAIGN AGAINST INJECTABLE CONTRACEPTIVES

Women's groups and health activists in India have been campaigning against the use of injectable contraceptives over the past many years. Injectable progesterone derivatives were developed in the 1950s. Schering AG in Germany was first with the production of Net En, while Upjohn Co began manufacturing Depo Provera. Toxicological studies conducted on these drugs showed their carcinogenic potential

on experimental animals like rats resulting in the withdrawal of the drugs from the market. The history of Net En and Depo Provera runs parallel to a large extent. The Federal Drug Authority (FDA) in the US denied approval for use of Depo Provera as a contraceptive in the US during seventies. Although the Toxicology Review Panel of the World Health Organisation (WHO) declared Net En safe for introduction in 1981, in 1984, the Federal Health office of Germany decided to restrict the use of Net En only for those women who do not tolerate any other method of contraception. At this time, USFDA was still unwilling to grant approval for the use of Depo Provera as a contraceptive. Thus, it was quite apparent that for many years, injectables were considered unsafe for use on women. The pharmaceutical companies involved in the manufacture of these contraceptives were trying their best to get injectables licensed in the country of manufacture in order to carry out large-scale marketing in the developing world and the pressure was mounting on the agencies like WHO and USFDA with passing years.

Attempts to introduce injectables in India were met with stiff opposition from women's groups and health groups. In 1985, a court case in Mumbai filed by the government, in which Women's Centre and Medico Friend Circle were interveners, stalled the move by a private practitioner to import Depo Provera. In 1986, public attention was focused on the unethical trials of Net En on poor rural women in Patancheru, Andhra Pradesh. Lack of informed consent, technical issues related to the hazardous nature of the drug, as well as issues related to safe service delivery became the grounds for a public interest case. The concerns raised have not been addressed till date, and the case is still pending in the Supreme Court. The fact that Net En was registered in India in 1985 by the Drugs Controller and approved for import and use by private practitioners, was kept a closely guarded secret and became known only in 1994, when Net En was officially launched in India for 'social marketing'. Depo Provera was also approved by the Drug Controller in 1993 and launched for 'social marketing' in 1994. However, permission for introduction of injectables in the NFWP has not been granted till date.

After giving permission for social marketing, the Drug Controller had 'advised' the drug company to conduct PMS on both Depo Provera and Net En but the reports available are extremely sketchy and the follow-up of three months is too

short to provide any useful data on long-term hazards. The issue of return of fertility remained completely unanswered in this small trial based on a few hundred users. Additionally, in spite of the manufacturers providing a budget for monitoring women for osteoporosis, the doctors conducting the trials did not feel the need to evaluate the effect of Depo Provera on bone density. This goes to show the inappropriate design and follow-up methodology adopted for the PMS! If injectable contraceptives are to be introduced on a larger scale two points need to be considered. One, a safe health delivery system with a regular follow-up and adequate medical infrastructure is necessary for routine use of injectables. Second, if women have to consider spacing methods like injectable contraceptives as safe and reliable, return of fertility has to be ensured. If PMS is not going to take care of many of the unanswered problems, their utility is debatable and the motives of Indian licensing authorities, the pharmaceutical lobby and aid agencies also become questionable.

The government may have officially withdrawn the 'target-oriented' approach of family planning, but the pressures of coercive population control have not changed. Amendments to the Panchayati Raj, Co-operatives and Municipalities Act in 1992 by the Rajasthan government, so as to disqualify anyone with more than two children from contesting election to local self-governing bodies is a very clear example of the newer disguised version of the 'target-oriented' family planning approaches. Haryana has already emulated the Rajasthan government's policy. Another such bill sought to be introduced, the Delhi Population Bill, 1999 goes further

by seeking to disqualify those with more than two children from being allotted a house under the government housing scheme, from availing of any loan facility, from drawing ration through the public distribution system and from being appointed in government establishments or public sector undertakings. These are a clear reflection of the undemocratic measures governments are willing to take to control population growth.

As long as the helief prevails that population cannot be controlled without a system of incentives and disincentives, the delivery of contraceptives will not be done in an environment that is woman centred, information giving and allowing free choice. And with hazardous, provider controlled contraceptives like injectables the potential for abuse and damage to women's health is tremendous.

The report by Saheli *Enough Is Enough: Injectable Contraceptive Net En -- A Chronicle of Health Hazards Foretold* talks about many of these issues, chronicles the history of injectable contraceptives and the campaign against them. It also outlines the interlinkages between pharmaceutical companies, government, scientific bodies and international funding agencies to understand the impact of hazardous contraceptives on the lives of women. Released on the occasion of World Population Day on July 11, 1999, the report serves as a timely reminder of the price women have to pay in the game of controlling numbers.

Notes

- 1 This article is based on and reflects the work of Saheli, Delhi, an autonomous women's group active in the campaign against hazardous contraceptives for more than 15 years.

Van Panchayats in Uttarakhand

A Case Study

Rakesh Agrawal

A product of colonial times, the van panchayats in Uttarakhand, though lawfully empower the residents living on the outskirts of reserved and protected forests to nurture trees and consume forest products, paucity of financial resources and negligible participation of women are some of the reasons for the failure of the panchayats to sustain and spread in many villages.

LIKE most institutions in India, van panchayats too were created by the British. And like other institutions this too was created to solicit people's support to pursue the Britishers' exploitative colonial policy. It is a well known fact that, prior to the British conquest, all forest in the country, including that in Uttarakhand, belonged to people. They had an inalienable right to manage and utilise forest resources. However, with the advent of the colonial forces, a systematic commercial exploitation of the forest in India began and, "by around 1860, Britain had emerged as the world leader in deforestation" [Gadgil and Guha 1992:118]. Indeed, colonialism proved to be the 'ecological watershed'.

In Uttarakhand, the large-scale commercial exploitation of the forest started with the Gorkha defeat in 1815 and the establishment of the British rule thereafter. To demarcate villages' boundaries so that the forests could be separated from the agricultural land, the first ever settlement was carried out by Trail in 1823. This was called as the Great Measurement in which the sole right of state in uncultivable land was recognised. This set up the process of slow but steady usurpation of people's rights by the state.

By middle of the 19th century the government realised the huge commercial potential of the inaccessible forests in the country, even these restricted rights were not tolerated. Little wonder, the 1865 Forest Act established the state monopoly on the forests in the country. Then, the 1878 Forest Act obliterated centuries of customary use by people and almost all the useful forests were declared state property by putting them either under reserved or protected forest categories. People faced formidable shortage of fodder, fuelwood and timber. Soon, they were rebelling all over the hills [for detail discussion see Guha 1991].

People in the hills also decided to put an end to all kinds of co-operation with the government in the management of the forests. Faced with changeable resistance and a violent mass movement, especially during the first world war when the demand of timber had shot up, the government began to ponder over the question of soliciting people's support in managing the forest and continuing their colonial aims. The government was immediately forced by the wide-ranging campaign to burn forests controlled by the forest department (FD) in the summer of 1921 that paralysed the administration.

The Forest Grievances Committee for Kumaon: As a result, in the same year, a Forest Grievances Committee under the chairmanship of P Wyandham (the then commissioner of Kumaon division) was constituted. Thakur Jodh Singh B Negi, MLC Garhwal, R G Marriot of the Indian Forest Service, and Pandit Lachmi Datt Pande representing Almora were other members of the committee. The committee's terms of reference were focused on three major questions: (i) What are the difficulties experienced by those who live in and near forests as a result of their existing system of management? (ii) How can these people be best interested in conserving and managing the forests? and (iii) How can their co-operation with the FD be encouraged and secured? The committee toured in Almora from May 16-27, 1921, and in Garhwal from May 28 to July 19, 1921. It examined 5,040 witnesses either in person or by representatives [FGCK 1994:162-79].

The committee looked into the grievances suffered by people because of the so-called scientific forestry introduced by the British. Nevertheless, it also praised the contribution made by the FD, at least in generating employment [FGCK 1994:165]. It felt that the most important problem faced by villagers was the ban

imposed on lopping by the FD, and the committee proposed to remove all restrictions on the lopping of oak and kokat trees except from the regeneration area in reserve forests. Similarly, it proposed to remove restriction on grazing animals including goats from the same areas [FGCK 1994:168-70].

The committee recommended the formation of village forest committees or van panchayats. However, the actual formation of these van panchayats took another 10 years. In 1931, the van panchayat regulation was constituted under the District Scheduled Act of 1874 that paved the way to the formation of van panchayats in British administered Kumaon division. In the princely state of Tehri Garhwal it did not apply, although the area had come under commercial management right since 1865.

Management of van panchayats: The van panchayats were allotted the area lying outside reserved and protected forests. Clearly, van panchayats were formed on those forests which were neither 'reserved', nor "protected" (as under the 1878 Act). The 1921 committee had put them under class I (non-commercial) forests. To form a van panchayat, a gram sabha should apply to the divisional commissioner for the formation of a van panchayat in the gram sabha. The application has to be signed by no less than the two-thirds (now one-third) of the adult population of the gram sabha who have been living in the villages under the gram sabha for not less than 10 years.

The managing committee of a van panchayat consists of 5 to 13 members elected by the local population. Each household is the member of the van forest in the village. The election is informal by raising hands not by secret ballot. The members elect their own sarpanch for a period of five years who is eligible for re-election for three terms. The managing committee is supposed to meet at least once in three months. The subdivisional magistrate is designated as the van panchayat officer. He is assisted in his work by van panchayat inspectors who are also from the revenue department. The decisions in van panchayat meetings are taken by a two-thirds majority of the management committee. The quorum of a van panchayat is two-thirds of its membership, including nominated members and sarpanch. The village patwari, village level workers, van panchayat secretary and representatives of the divisional forest officer are eligible to participate in the meetings but they cannot vote on any issue.

The function of van panchayats: Followings are the functions of van panchayats: (1) to check indiscriminate felling of trees and tempering of fencing by villagers; (2) to ensure the equitable distribution of forest products amongst the members; (3) to earmark sylviculturally fit trees for felling; (4) to prevent encroachment on van panchayat lands; (5) to fix boundary pillars and to maintain them; and (6) to carry out the direction of the deputy commissioner or sub-divisional magistrate regarding the administration of these forests.

In the discharge of its functions a van panchayat can levy up to Rs 500 with the prior approval of the deputy commissioner. A van panchayat can seize cattle and the offending cattle can be impounded. In this respect van panchayats enjoy all the powers under the cattle trespass Act, 1871. Van panchayats can also forfeit weapons of the offenders.

Financial powers of van panchayats: Following are the financial powers of van panchayats: (1) van panchayats can sell the grass and fallen twigs for the firewood, and stones and slates to local people; (2) resin tapping and felling of trees can be taken up with the approval of the FD; (3) Auction of trees up to an estimated value of Rs 5,000 can be undertaken with the approval of the divisional forest officer; (4) auctions above Rs 5,000 are conducted by the FD with the approval of the conservator of forests.

The FD charges all expenditure incurred in resin tapping from van panchayat forests. On revenues other than resin, forest departments, charges 10 per cent as administrative expenditures. On resin tapping, it keeps 40 per cent of total earnings. In fact, "only 40 per cent of the proceeds from sales go into panchayat accounts and even these can be spent only with government's (i.e., the deputy commissioner) permission" [Somanathan 1991:23]. Thus, this money is not readily available to the van panchayats for development works such as roads, schools, hospitals in the village.

The van panchayats in general do not have women members. They do not prepare any working plan and no forest management is practised. However, the responsibility of preparing working plan for van panchayat forests rests with the FD under the Van Panchayat Act of 1976 though no progress has been made in this direction so far. Encroachment of the van panchayats and pilferage of grass, fodder leaves, fuel, timber, etc., is common. The sarpanch imposes fines on the recalcitrant persons. These fines are supposed to be

realised by the sub-divisional magistrate but the system seldom works.

VAN PANCHAYATS IN UTTARAKHAND: CURRENT SCENARIO

The 1931 United Province Forest Act classified forests in three categories: reserve, civil-forest and panchayat. The FD has its exclusive control over reserve forests while civil-forest and panchayat forests fall under the jurisdiction of the revenue department. According to the data of state forest department, 65 per cent of the total geographical area is covered by forest – a highly controversial data, and canopy cover is hardly 40 per cent. Forest under van panchayats cover 4,69,326 ha that is 13.63 per cent of the entire forest cover (34,46,655 ha) of the region.

It would be pertinent to point out here that van panchayats are formed on revenue forests only, i.e., on civil-forest forests, and the reserve forest under the FD cannot be part with. After the formalities of forming a van panchayat is over, the civil-forest forest lying under that particular (and under the jurisdiction of the revenue department) becomes the van panchayat. In fact, there are 15,166 inhabited villages in Uttarakhand but van panchayats are only in 4,891 villages (by March 1996).

Secondly, in Uttarakhand the maximum concentration of van panchayats is in Kumaon division. The reason behind it was that when the 1831 Act was passed. Tehri Garhwal was a princely state that included the present Dehradun and Uttarakashi districts as well and the Van Panchayat Act had no effect there. In fact, the first van panchayat in Tehri-Garhwal came into existence only in 1991. In 7,009 inhabited villages of Kumaon, there are 3,056 van panchayats and in 8,157 villages of Garhwal there are only 1,811 van panchayats.

Problems faced by van panchayats: Less than one-third villages in Uttarakhand have opted for van panchayats. It seems that formation of van panchayat in one village has not inspired others to follow suit. They face many administrative, financial and management problems. Some of them are listed below:

The biggest problem faced by them is that of security. Because of the lack of finance, they are unable to post a guard and fence the forest which are subjected to illegal grazing, felling of trees and encroachment. Lack of women's participation in most van panchayats. In Uttarakhand, women are responsible to carry fuelwood and fodder from forests, and they know forests more than men, still their participation in van panchayats and its decision-making process

is negligible as a result fodder and fuelwood yielding species are neglected and commercial ones are encouraged; Scarcity of water in most panchayats that has hampered afforestation and nursery raising activities; Lack of people's participation in guarding and maintaining forests; Encroachment, uncontrolled grazing and illegal cutting of trees; Paucity of financial resources. Most van panchayats are reeling under severe financial drought. The sarpanch of a van panchayat cannot withdraw and spend more than Rs 50 at a time. The money earned by them is deposited with the district treasury that is never available to them at the time of need; and Dual control of forests and revenue departments over them. While the revenue department has the administrative control, the FD exercises technical control over van panchayats. This has hampered their working severely.

In 1993, the government of Uttar Pradesh through an ordinance tried to introduce a new set of regulations, called 'Panchayati Van Niyamawali, 1993', having 59 points. Amongst others, it reduced the percentage of villagers required for setting up a van panchayat from one-third to 20 per cent, inclusion of three women members in a MC of seven and four in that of nine and keeping at least 50 per cent of the net income of van panchayats on the betterment of the forest. It also provided the opening of a bank account in post offices to keep the remaining 40 per cent amount. However, the 'Niyamawali' is yet to be implemented.

Case of a woman-dominated van panchayat: In the remote valley of Kalpeshwar Mahadev, one of the 'panch' (five) Kedars – a lesser known pilgrimage in Chamoli district – lies within the 245 hectare forest belonging to the van panchayats (forest panchayat) of the two gram sahahs – Urgam and Bharaki – is very dense. This van panchayat is one among the very few women-governed and a very well managed van panchayats in Uttarakhand.

History: The Bharaki-Urgam van panchayat was established in 1951. The area was beyond the proposed motor road which was connecting Karna Prayag to Joshimath and it already had quite a dense forest. However, several people, who were aware of the possible danger the proposed road could bring to the area, wanted to keep the forest intact. So, a proposal was mooted and soon, the required one-third majority was obtained. "In fact, some other people who sensed the opportunity available to exploit the

massive forest wealth also supported the formation of van panchayat", says Rajendra Singh, up-sarpanch and the only male member of the van panchayat's management committee.

Eventually, the well wishers of the forest had the upper hand. But this was not without struggle. Initially, van panchayat was in the hands of men and some unscrupulous sarpanches went ahead with their plans of exploiting the forest wealth. However, already a protest movement was shimmering in the valley. Under the charismatic leadership of Bauni Devi, the village 'Mahila Mangal Dal' had waged a struggle to uproot the coal making kiln in the village. "That 'bhatti' (the kiln) was burning down hundreds of trees and creating a havoc in the village", says Bauni Devi. One fine day, all the women of the six villages gathered and stormed the bhatti.

Then, the sarpanch who was hand-in-gloves with timber smugglers, was planning to cut 450 green trees to sell them. A charged Mahila Mangal Dal decided to stop it. A train of about 200 mules was on the way to the village. En route itself, the contractor had to face the wrath of the women of the area who forcibly stopped the mule train and thrashed the contractor. Sarpanch had to apologise. Eventually, he was forced to leave.

Area: The total area of van panchayat is approximately 245 ha. There are five revenue villages lying under its jurisdiction - Bharaki, Bheta, Urgam, Kyari and Salana. The average altitude ranges from 1,800 to 2,200 metres.

Species: The forest is covered by tens of thousands of trees, mostly with local species like 'Bauni' or oak (*Quercus incana*), *Prunus amerila* (chuli or local apricot), 'Buransh' or Rhododendrons, and *Cedrus deodara* (deodar). Chir pines is covered hardly 10 per cent of the area at the lower slopes.

Management: There are 13 members in the managing committee (MC), including the sarpanch, Bauni Devi. All, but one (the up-sarpanch) are women and three are dalits. Meeting of the MC is held regularly every month. Every sixth month an open general body meeting comprising all members of the van panchayat is also held. In these meetings, usually the issues raised are: opening and closing of the various parts of the forest, issuing of fallen trees to the members, afforestation and raising of nursery, protection of the forest and its co-operation with the gram panchayat.

Rules governing van panchayat: With the consent of the villagers, the van panchayat had passed elaborate rules to

manage the forest. Forest lying within the periphery of each revenue village, is divided into two compartments which are opened each year alternatively for cutting grass. Grazing is allowed during rainy season. Cutting of green trees is strictly prohibited but fallen twigs and branches can be collected for fuelwood purposes. On the basis of need, members are issued dead trees for building purposes.

Income and expenditure: Today, this van panchayat is one of the richest in Chamoli district with a cash reserve of Rs 2,93,085 as on May 26, 1998. Main sources of income include: permits of dead trees issued to members, auctioning of grasslands to members; lodging charges from pilgrims staying in the guest house constructed by the van panchayat and from fines imposed on members and outsiders for the violation of rules. Main items of expenditure: on the maintenance of the guest house, nursery raising, salary to the guard and on afforestation.

Benefits to members: Each household is able to meet fully and completely its biomass requirements of fodder, fuelwood and fruits. The members also get enough wood for building purposes. Also, the entire valley is highly rich in terms of biodiversity and there is an abundance of water resources.

Encroachments: During 1981-82, some outsiders, with the help of the forest department, had cut down 475 green trees and the van panchayat till date has not got its royalty.

Guarding and protection: There is no barbed fence or any other physical structure protecting the forest. "We don't need artificial means of protecting forests as everyone in the area is so involved with the forest that they themselves protect it", says Govindi Devi, a dalit member of the MC. Even though, a guard on the monthly salary of Rs 600 is appointed.

Afforestation and nursery raising: There are two areas of about 12 ha each where afforestation has been carried out by the van panchayat. During 1997-98, a nursery containing about 20,000 saplings, mainly of fruit yielding trees, was also raised.

Co-operation with gram panchayat: The 'gram pradhan' is also a woman. Thus, for the first time both the institutions are governed by women. This has yielded in a high degree of co-operation between them. "Being women, we understand our problems better and conducting these institution successfully, has given a lot of confidence and generated self pride among women", says Saraswati Devi, pradhan of Urgam gram panchayat. As an example, last year, the gram panchayat decided to

expand the village school building on its own and raised Rs 35,00 from the villagers. The van panchayat also decided to chip in and contributed Rs 10,000 for the cause.

Transparency: Last but not the least, the functioning of the van panchayat, first time under women, has become more transparent and the common villagers are not afraid even to censure an erring sarpanch. Although income and expenditure of the institution is made public with a statement put on the public board, earlier this year, without any prior permission of the MC, Bauni Devi spent Rs 50,000 on the guest house of the van panchayat. The villagers got enraged and she was forced to make this expenditure public in a general body meeting organised in July this year.

In a nutshell we can say that key changes after women started to manage Bharaki-Urgam van panchayat have been: a more transparent working system of the managing committee, close co-operation with the gram panchayat and a more active and more responsible governance that ensure a fuller participation of people.

Reinforcing Insecurity

Gautam Navlakha

More than anything else the draft of the nuclear doctrine released by the National Security Advisory Board underlines the international perception of India's big power ambition acquiring threatening dimensions.

THE release of the draft of the nuclear doctrine by the National Security Advisory Board (NSAB) on August 17 is said to be a 'natural' fallout of the nuclear explosions that took place last year. It is claimed that Pokhran II declares the government of India's commitment to acquire nuclear arsenal and therefore a nuclear doctrine must follow. And if there is a nuclear doctrine it must believe in the notion of mutual assured destruction or else it makes no sense to acquire n-weapons. This in turn means ensuring that the arsenal must be of such magnitude as to offset the chances of their being destroyed. This, in turn, throws up the need to protect the nuclear arsenal. In short there is an entire chain of requirements that accompany nuclear arms and the theory of deterrence.

There are two issues that must be kept in mind. In the first place nuclear arms are not ordinary weapons but pose a threat to all living creatures and therefore have no capacity to enhance security. In fact it is just the opposite. Indeed supporters of n-weapons cite the presence of n-arms with the five big powers to justify their stance. This holds true for others who will find justification in India's acquisition. After all what is sauce for the goose is sauce for the gander, too. In addition India's nuclear weapons programme would invite nuclear arms targetting of India by China and other n-powers, which the Indian people can do without. And secondly, there is nothing pre-ordained about translating capability into deployable arsenal. The NSAB could as well have declared freezing the n-weapons programme linking it to a time-bound framework for global nuclear disarmament. The political spin-offs from this would have been incalculably greater; it would have replaced the agenda of nuclear non-proliferation with n-disarmament, in line with country's declared policy, reduced perceptibly tensions with the neighbouring countries, enhanced the diplomatic profile of the country, to mention just few good things. The fact that nuclear disarmament is technologically an achievable goal means that a nuclear rollback is feasible and it is a proposition which civilised governments

ought to pursue. Which is to say that there is nothing natural or security-enhancing about enunciating a nuclear doctrine of 'deterrence', minimum or elastic. Therefore, the excuses offered that in the 'given' situation it is logical for the government to spell out 'its' nuclear doctrine is as good as saying that the NSAB did not explore other possibilities. It does not mean that there were no other options available.

Such pragmatism is propagated to mask the despicable reality of their hegemonic enterprise which will be at the cost of the life, liberties and security of our people. If the argument is that this was not their brief then the NSAB ought to have rejected such straitjacketing. If they agree with such a blinkered perspective then the entire business of national security that dislocates people from the centrality they occupy in a democratic republic should be thrown into the dustbin. Sadly, such is the power of self-delusion that the impudent claim of chairman of Atomic Energy Commission that India is capable of making a neutron bomb is lauded as achievement rather than condemned for its anti-people enterprise. (A neutron bomb kills people while allowing physical structures to remain intact.) There were worldwide protests against the Jimmy Carter administration in the US when it announced plans to make a neutron bomb for precisely this reason. However, all this is an attempt to introduce a similar policy pursued by the US vis-a-vis erstwhile Soviet Union, namely, of bleeding Pakistan white through a debilitating arms race.

What was earlier whispered about "finishing for once and for all the menace posed by Pakistan" now threatens to be a matter of public policy. Members of the NSAB and politicians have openly argued in seminars that an economically beleaguered Pakistan can ill-afford an arms race and therefore by increasing military expenditure by 1 per cent of the GDP, which they claim, Indian economy can easily absorb unlike economically much weaker Pakistan, India can tackle Pakistan without much trouble. This outlandish idea gains in credibility, from the pronouncement of the president of the Republic and

the demand from the media 'specialists' for increasing allocations for the 'Armed Forces of the Union' under some of the most specious and misplaced arguments. But all that pales in comparison to what the NSAB now advocates. This incredible doctrine was undertaken without the bother of a comprehensive strategic thinking. Indeed it has not taken place either before or after the nuclear bomb explosions in May 1998. And yet the NSAB proposes to lead us down the road of ruin through yet another round of ad hocism so common to the GOI's security perspective. Whether or not the nightmare scenario becomes a reality the fact that such ludicrous ideas can be touted in this day and age signal a regression in the conduct of public affair.

In the wake of the Kargil imbroglio the spurt in demand for increasing military expenditure was explained away as the need to provide proper equipment for the soldiers. The real and simulated pathos was used to argue that there was need to increase expenditure to 3 per cent of the GDP from which it had fallen over the last 10 years and unless this is reversed ill-equipped soldiers will be no match for the 'intruders'. Figures of Rs 10-15,000 crore are floated without hesitation. A new corps is being set up after Kargil and will be headquartered in Ladakh. This will man the Kargil heights at a cost of Rs 10,000 crore. In addition to the raising of new divisions for this corps or in lieu of this, the strength of other formations will be augmented. There is a move to raise 20 battalions of Assam Rifles and 12 battalions of Rashtriya Rifles, altogether 30,000 personnel, roughly the number required for the new mountain corps in Ladakh. In tandem the vacuation of the armed intrusion from the Indian occupied part of the disputed territory with the help of US became a 'victory'. The destruction of a slow moving reconnaissance plane killing 16 Pakistanis was projected as a warning and the mark of Indian military preparedness. All this only reinforces international perception that the two neighbours are irredeemably irresponsible.

The six page draft¹ offers 'no first use' against the non-nuclear countries, "punitive retaliation" against "threat of use" of n-weapons (given that the response time between India and Pakistan is 3-5 minutes, only gambling with people's lives is possible), and declares that the minimum deterrence that it speaks of "is a dynamic concept related to the strategic environment, technological imperatives and the needs of national security". These Doctor Dolittles, nevertheless, carry on to add that the "actual size, components, deploy-

ment and employment of nuclear forces will be decided in the light of these factors". This makes minimum deterrence so elastic that it becomes definitionally a self-defeating exercise. The venerable NSAB claims that this minimum deterrence will be based "on a triad of aircraft, mobile land based missiles and sea based assets". This would require an additional expenditure of Rs 10,000 crore annually. Missiles are a spin-off from the space programme – the launch vehicles for satellites can become launching vehicles for nuclear warheads. Their cost would be roughly Rs 1,500-2,000 crore annually while the acquisition of aircraft and submarines including n-subs (within the logic of minimum deterrence the second strike capability can be best insured with the n-subs) would require Rs 5,000-6,000 crore annually. One of NSAB members in an attempt to damage control recently wrote in *The Hindu* (August 28) that "there is no real prospect that India will be able to build a sea-based arsenal in near future..." If so why even mention it. To this must be added special equipment to store them, and a special force estimated to be up to 50,000 to protect them. Again, having brought the nuclear warfare close to our borders soldiers must be provided special protective gear. All this will cost no less than Rs 2,000-3,000 crore annually. Presumably everything has been taken into account. Except for the people. Since nuclear warfare would be brought closer for our people they need shelters and medical facilities all across the country. But even ordinarily our government is incapable of securing the lives and liberties of the people therefore the NSAB dutifully leave people to their own device. They can always argue this was not part of their brief although leaving people vulnerable to thousands of years of radiation deaths presumably is. It is also remarkable that there can be 'national security' in which people do not figure although a proposal which can annihilate them can be discussed with clinical equanimity. Would our resources suffice to enable the government to acquire such life destroying capabilities? The sheer fact of entertaining such ambition implies trying to realise a nightmare, having failed to provide a life of dignity for our people. Given that this draft was released on the eve of general elections, by the National Security Advisor, the victory for the ruling dispensation will be touted as endorsement for this suicidal policy. And the total cost of conventional and nuclear build-up would be a staggering Rs 20,000-25,000 crore. This is more than the amount allocated by the central government for education, health, employ-

ment generation and social welfare.

The government's military expenditure on the 'Armed Forces of the Union' have consistently been close to 3 per cent of GDP. (See *EPW* May 7 and 14, 1999 for details). Although comparing the military expenditure to GDP is misleading because India's GDP has increased at a much faster rate over the last 15 years therefore maintaining military expenditure at 3 per cent of GDP actually amounts to a stupendous increase in wasteful expenditure. And if the draft Nuclear Doctrine becomes a policy then the acquisition of n-arsenal will push the expenditure from Rs 15,000-25,000 crore. It is interesting that Japan's defence expenditure fell just below 1 per cent of its GDP in the past few years. This does not mean any real cutback in the allocation. Rather given that the size of the GDP rose the allocations required remained high although in terms of GDP it showed a fall. Again the 3 per cent of GDP that is banked about in India is something arbitrarily arrived at. It is not some international norm nor is it something that has been worked out after careful analysis and debate. It is apparently something bequeathed, hidden from the public and the parliament, and therefore considered a tradition beyond scrutiny, a matter of blind faith. For practitioners of realpolitik such loyalty could professionally be hazardous. And yet if it is passed off as some well-thought-out norm it is because defence is a holy cow which few dare to critically examine. And it is prone to misuse as the unwritten and hidden strategic doctrine which for all these decades has remained the monopoly of a secretive security regime which remains unaccountable to the public and parliament. Therefore, in its very essence the whole enterprise shrouded in mystery is reactionary and antithetical to democratic governance.

Besides if bleeding heart chauvinists are concerned about the plight of the soldiers then they should worry about the use of the 'Armed Forces of the Union' against our people which made the Indian forces the busiest 'peacetime force' in the world for over 25 years and has earned for it the dubious reputation of behaving like an occupation force against our own people. It is this that takes away between 30-35 per cent of the total real expenditure incurred on the military behemoth in India. And real savings can be realised through democratic resolutions of the conflicts in which 55-60 per cent of the 'Armed Forces of the Union' are deployed. If to this is added the wastage (such as for the main battle tank) and delay (such as for the advanced jet trainer) and inepti-

tude (such that soldiers alive are declared dead even when they are not) then there enormous savings possible to cut military expenditure and secure a life of dignity for our people.

The fact that in the already beleaguered Pakistan are present forces which are equally chauvinistic and reactionary and unmindful of the interests of the people should not distract us from the reality that India given its physical size, diversified economy and military might should behave with restraint and responsibility and not as a neighbourhood bully. Having introduced the nuclear genie renewing a debilitating nuclear arms race would jeopardise the freedom and welfare of the entire subcontinent. The danger of Pakistan's collapse and its consequence is just one aspect of this scenario. There is the real danger too that the arms race will strangle our own economy, enslave our own people under the weight of competitive jingoism unleashed inside the country as well as between neighbouring countries. Whereas we can act arrogantly against Pakistan it is doubtful our economy can withstand adversarial relationship with China or for that matter a freeze in ties with the US or EU. The pursuit of regional power enterprise is also out of question without the approval of the US. The price extracted for this will be high and even then will make us as safe as Indonesia no sooner the dictator Suharto became expendable and the regime had to accept a referendum in East Timor under the auspices of UN, in order to be bailed out. An enterprise of this kind would anyhow legitimise intervention by international busybodies. Given the dependence of our economy on capital inflows and technology, the relative small size of our market does not allow much room for Indian policy-makers to manoeuvre. If it is sought to be used as a bargaining chip, since the caretaker government had obligingly offered to talk to the US administration it is a dangerous diplomatic game of bluff and bluster because there is much of make believe in Indian strategic community which believes and reinforces self-delusion. And no matter what the size of our nuclear arsenal it will never be enough to allow any strategic autonomy. Instead what the NSAB draft ensures is to secure a perception of India's big power ambition acquiring threatening dimension.

Postscript: It is possible that the draft nuclear doctrine is a rhetorical exercise to electorally benefit the ruling dispensation. Therefore, once the elections are out of the way the government will begin back-tracking, just as was done after Pokhran II last year where bravado was

followed by whimper. However, rather than feel comforted by such cynical possibility, this should only make us worry about the state of our polity and the consequences of such rhetorical flourishes. Because even rhetoric extracts a heavy price and allows forces of hatred and jingoism to exploit the fear and thrive amidst despair and deprivation.

Crisis in East Timor

Olle Tornquist

Indonesian army let loose the dogs of war in East Timor but could not call them off. The UN failed to intervene in time. But beyond these, a lasting solution to the problem can only come through strengthening the democratic movements both in Indonesia and in East Timor.

WHEN president B J Habibie announced his second option for East Timor in January this year, the National Council of East Timorese Resistance (CNRT), bravely, and the United Nations, finally, took the opportunity to make decisive advances. All parties which have not recognised Indonesia's annexation of East Timor, including scholars, agreed that it was an opportunity not to be missed – despite the obvious limitations in the deal in the May 5 agreement (primarily regarding full military/security authority resting with the Indonesian military (TNI) and police) and the high risks involved.

The crisis in East Timor is a repercussion of the ongoing crisis in Indonesia, which in some respects went from bad to worse following the relatively free but not entirely just and very shallow elections in June.

The armed forces get 38 non-elected members in the house of representatives (DPR), while 34 per cent of the delegates in the people's consultative assembly (MPR), which shall appoint the new president, are not elected but appointed in a way that makes the armed forces and money politics decisive.

During the elections, moreover, many basic issues and interests were swept under the carpet, including grievances in several provinces and in East Timor, and not allowed to be voiced and represented within the new political framework. Hence, they were bound to appear outside that relatively orderly framework.

Also, the most genuine and propelling democratic forces – the students and the long established pro-democratic movement of NGOs et al – were marginalised by neo-traditional elite politics.

Consequently, a political vacuum de-

veloped between the elections of DPR members and the MPR election of the new president. This lack of political leadership has boosted the role of the military, with all major parties involved needing its support and votes. Meanwhile all the major parties are depending on and are affected by money politics. Although Habibie has been badly hurt by the Bank Bali scandal, his Team Sukses may still have enough money to buy the necessary votes in the MPR.

Altogether, this has given the armed forces, and the police, increasingly more space to undermine the East Timor agreement, of which they were very sceptical in the first place.

The logic was to create semi-civilian counterparts to the CNRT in negotiations; to further develop and empower the militias to promote the pro-autonomy side in the referendum by creating fear among the immigrants of what would happen if East Timor became independent, and among the East-Timorese of terror in the future in case they didn't accept Indonesian dominance; and to display to protesting people in other Indonesian provinces what kind of problems and horrors they are likely to face in case they continue with their demands.

This logic meant that if the referendum was lost, a mini-civil war would be started in order to, firstly, further eliminate, if possible, the Falantil; and, secondly, not lose face but be able to say 'we invaded East Timor in 1975 to save the country from a civil war and when we leave there will again be a civil war'.

The CNRT kept its promise to keep a low profile and not allow itself to be provoked. It consistently stressed reconciliation but found it difficult to simulta-

neously shape a back up in case things would go wrong.

At the same time, the UN proceeded with the referendum, though to my knowledge without any serious back up. And to my knowledge both those parties felt that not going ahead with the referendum would amount to giving in to the militias' intimidations and passing a unique opportunity.

In my own analysis at the time, a high turnout and more than two-thirds victory for the independence side would mean least risk of violence. The pro-Indonesian side would realise that they had lost and after some face-saving, including in terms of a mini-civil war, the unrest would peter out as the central army leadership would abandon most of their local thugs.

However, for the second time since the crisis in Indonesia became obvious in mid-1996, I was wrong. (The first time being in April 1998 when I said that the Soeharto regime was likely to remain at least for a few months because the International Monetary Fund and the World Bank had given up much of the pressure. Instead, on May 4 Soeharto implemented even harsher measures than prescribed by the IMF and thus generated the riots and demonstrations that brought him down.) I was wrong this time, because the central armed forces leadership lost the control I thought it was capable of upholding.

So, while people bravely resisted intimidation and terror, and the armed forces respected the very electoral operation – just like during the Indonesian elections – the local militias of the armed forces began to follow their own logic. And even after having proven its point (that some kind of civil war would follow if East Timor would go for independence), the central armed forces command was unable to do much about it. Apparently a monster had been created that now ran wild.

In this situation the CNRT could not do much more than refrain from being provoked and thus eliminated, which must have been difficult enough.

The UN was rather helpless. Of course, immediate UN strengthening of its local representatives in order to maintain its presence would have been in full accordance with the May agreement (Article 7), but that was not done. Most people would of course like the UN to do much more than that, but it was simply not realistic.

This was particularly unrealistic in the Asian framework where powerful states are very eager to preserve their powers against any form of intervention, where the only successful intervention against state terror and murder, the Vietnamese intervention in Cambodia, was resisted by

Notes

- 1 A member of NSAB writing in the *Hindustan Times* (August 25) claimed that the document lays down the "broad parameters of India's nuclear doctrine", but goes on to claim that "no government will be able to go back on the basic parameters outlined in this consensus document". How strange that what purports to be a draft cannot be thrown away, let alone changed or slashed.

the west itself, and where there is not even the poor African capacity of sending in local troops from neighbouring countries, as in the case of Sierra Leone.

If there had been an armed intervention anyway, the risks of making things even worse would have been very high. First, the unity between the local militia and the local police and army forces would have been further cemented, also strengthened by full scale support from Jakarta – we would have got a combination of a civil war and Indonesian struggle against foreign intervention. Second, this support from Jakarta would then also have included the entire political elite, mass media and so on. Finally, this in turn might well have totally derailed the already weak process of democratisation in Indonesia (not to talk of its economic recovery).

The UN, as already mentioned, could well have referred to Article 7 in the May agreement and immediately sent in more personnel to uphold its presence. Here the UN itself failed and cannot blame the member states. Initially the UN pulled out. This is extremely serious, not just for the East Timorese but also for the UN itself. Apparently it was primarily thanks to the brave staff at its Dili headquarters, who refused to leave, that the UN retained some presence in East Timor – while it should have been quite the other way around, with volunteers, diplomats et al moving in.

The only thing remaining, then, was economic and other diplomatic measures. But the process was slow. The major actors were apparently afraid of losing out in Indonesia, including economically – even if the official arguments mainly referred to the risk of derailing the process of democratisation, a risk which may be disputed and which I shall return to.

However, there was enough pressure on the Indonesian regime to cause a major split within its government. We do not know if Habibie wanted to allow foreign intervention, but he himself, many of his ministers and vital parts of the parliament clearly first resisted defence minister and chief of the armed forces Wiranto's demand for marshal law in East Timor, and then they rapidly had to give it up and allow Wiranto to go ahead.

To my understanding the then rumours about a coup were, thus, baseless. Why would that have been necessary? The military already dominated. Rather, they needed civilians. The rumours were best suited to scare the west, and the democratic opposition, from putting 'too much pressure on the regime'.

There is one positive consequence of the crisis: by now it should be fully clear for

the entire world, and many Indonesians, how political violence works: First, the state-cum-military worsening of various local conflicts and promotion of thugs/militias in clamping down on people; second, giving the military/police itself an opportunity to intervene.

But there is another compulsion. When first having created this climate of death – which make people fight each other and fear each other – the state and military must then also put itself in command of this fear and death and even be able to claim that it is the only force that can save the nation and save people against their own evil.

In the case of East Timor, however, it had gone too far. Wiranto, never approved by East Timor veterans in the field, lost control. At that point, his entire career as well as the prestige of the armed forces as a whole rested with their capacity to regain control of the wild beasts in East Timor, including sections of Lt Gen (ret) Prabowo Subianto's old security forces and the Dili governor who says he will continue to fight and that he ignores Habibie's acceptance of the results from the referendum since "he is just the president, he has never been in the field".

It took just a few days to prove that Wiranto and the central armed forces were not capable of doing this. And by now accepting an international peace-keeping mission they have, to my understanding, got a new lease on life that rests with their ability to co-operate and forcefully contribute to the tasks of the mission on East Timor.

But an additional question is, of course, if this kind of stability in Indonesia, and this kind of 'law and order' and 'stability' in East Timor, are acceptable to Timorese and Indonesian democrats, and to the international community?

It is essential to remember that sanctions against authoritarian rulers may indeed backlash and not be very successful, as they did and were during the crisis in late 1997 and early 1998. They could generate a conservative nationalist movement – in case international concern is not coordinated with the democratic opposition. There is much to learn from the case of South Africa and realise the importance of supporting Indonesian and East Timor democrats in their struggle for human rights and democracy.

For instance, even Megawati, who is eager to retain the support of the military and did not want East Timor to become independent, has recently accused Habibie and his administration of double standards, a democratic referendum combined with "undercover methods...including

allowing the spread of violence". She has promised to respect all international agreements and said that if and on becoming president she would "help East Timor develop as a peaceful nation and become a 'brother' to Indonesia". Moreover, she has appealed to especially the armed forces and police to not undermine this. Also, the National Commission of Human Rights urged the government to lift the state of emergency and invite a UN peace-keeping force to restore order.

It is essential to remember that it is not 'only' a question of putting an end to the open violence and terror in East Timor. We do not know how many, but probably some hundred of thousands of people have fled up in the mountains where there is a lack of food and water. And many have taken refuge elsewhere, including in militia-armed forces controlled camps in West Timor. Before an armed peace-keeping force is able to enter, it is urgent that international humanitarian relief can come in.

The UN must immediately extend its own representation in East Timor, not pull out of it, so that they can monitor the situation, pave the way for humanitarian relief, and enable Xanana Gusmao and Bishop Belo to return and take the lead in a process of reconciliation.

Finally it is essential to return to the argument that the point of departure for international concern must be to support Indonesian and East Timor democrats in their struggle for human rights and democracy.

This is not just to prevent a nationalistic backlash and more military powers. This is primarily because foreign intervention, even with the best of intentions and armed or not, simply does not make sense if there are no local roots and propelling forces to guide and take the fundamental decisions.

The fate of East Timor depends on Indonesia and the fate of both East Timor and Indonesia depends on the ability of the Indonesian democratic movement to counter authoritarian nationalism through a renaissance of the original nationalist project and especially its ideals of freedom and justice. And the bottomline, then, is that the forces of violence cannot be allowed to first run wild and then domesticate the situation.

There cannot be democracy and not even stability in Indonesia before the forces of violence are dealt with, domestically as well as in East Timor. Truth and reconciliation is a must. This goes beyond the current crisis. This includes even the massacres in the mid-1960s. But first East Timor.

Dynamics of Non-Involvement in ASEAN

Rhetoric and Primordialism

Vejai Balasubramaniam

It has been contended that ASEAN's members have ceased to cherish the principle of non-involvement in one another's internal affairs. By way of illustrative example attention is called to the Indonesian and Philippine gestures of support for Anwar Ibrahim after he was dismissed from the Malaysian cabinet. Noting that such clashes among ASEAN members only take the form of phases of rhetoric and arguing that the rhetoric is rooted in old history, this article attempts to demonstrate that non-involvement is very much alive.

FOR much of the eighties and the nineties south-east Asia had been economically the most dynamic part of the world. The advances in economics, it is argued, had begun to ramify into politics in the new states of the region. Among other things, the initial contention arising over Myanmar's application for membership in ASEAN is seen as indicative of a trend away from the cherished principle of non-involvement by governments in the region. The same view is also held with respect to the remarks and the ensuing war of words engaged by the leaders of states in the Malay world. Ideologically, this trend is viewed favourably and perceived as helping to expedite democracy in the region. This article argued that to construe the war of words and criticisms as involvement in the internal affairs of another member state is misplaced and ahistorical. What appears as interference is no more than rhetoric and a reflection of the primordialism which pervades interstate relations in the region. It further contends that to the contrary, this rhetoric works to enhance regional co-operation and that non-involvement is alive and well in south-east Asia.

I

Introduction

The centre piece, or the crown jewels, of the Association of South-East Asian Nations (ASEAN) is the spirit of consensus and the principle of non-involvement. According to the spirit of consensus decisions concerning ASEAN must secure the consent of all the member states. The principle of non-involvement states that members should not become involved in one another's internal affairs. While the

idea of consensus appears to be generally lauded, seen to be reflecting (as it does) broad democratic ideals in decision-making, that of non-involvement has come under increasing scrutiny and is being seen as retrogressive.

In fact, it is argued that of late this principle has been undergoing a change. The initial disagreements surrounding Myanmar's application for ASEAN membership is seen as reflective of a change. This despite the fact that it amounted to no more than rhetoric. In the final analysis, Myanmar's membership was endorsed by all the ASEAN delegates (in spite of the initial reservations of Thailand and the Philippines). The excitement passed.

But it resurfaced in the wake of the sacking from the Malaysian cabinet of Anwar Ibrahim, who had held the posts of deputy prime minister and finance minister. Indonesian president Jusuf Habibie and Philippine president Joseph Estrada made statements of support for Anwar and stated that they might not attend the Asia-Pacific Economic Co-operation Group (APEC) summit scheduled to be held in Kuala Lumpur in November 1998. For a moment it appeared that the pundits who argued that some fundamental change was taking place were about to have their day. But this proved short-lived: both the presidents later confirmed their attendance at the summit.

Once again the pundits, left disappointed, merged into the background. They waited there for the next round in the war of words, and in the process left the cause for the rhetoric and war of words undiscussed. By arguing that the rhetoric engaged in by ASEAN governments has

roots in old history, this article suggests that it is necessary to go beyond the ahistorical approach adopted by the self-styled experts of the south-east Asian political scene.¹

II

Unresolved Contradictions

The Malay world, comprising the present-day states of Malaysia, Singapore, Indonesia, Brunei and the Philippines was historically part of the *longue duree*² which linked India and China to the Mediterranean. Located along the maritime trade routes between these two ancient civilisations, the region was a noted producer of spices and exotic commodities such as birds' nests and 'tripang' (sea cucumbers). This attracted trade and traders to the port polities which existed there and functioned either as export centres for jungle and island produce or as transshipment centres. The dominant elites and rulers of these port polities adopted Hindu forms of kingship and were called 'rajahs' or following their adoption of Islam, 'sultans'.

These maritime kingdoms were amorphous in character and based on loyalty to the person of the ruler: the realm was determined by the number of people owing allegiance to a rajah at any given time. Trade provided the resources by which the elites in the Malay world increased their following and expanded the realm. Accordingly, trade-centred rivalry was an important feature of the region.

Of the strategies which featured prominently in the struggle to control trade, marriage was arguably the most important. Typically, the elites of a particular port would upon attacking its rival, marry into the ruling families there. In this manner the kingdoms in the Malay world came to be linked to each other through kinship and marriage ties. In this manner powerful kingdoms came to exist in Kedah, Malacca, Palembang, Brunei, Sulu, Aceh and Sulawesi from the 10th to the 15th century.

The arrival of the major European powers in the 16th century and the subsequent colonisation of the region led to its division into British, Dutch, and Spanish spheres of influence. For example, the 1824 Anglo-Dutch treaty divided the Malay archipelago, as a result of which the area covering present-day Indonesia passed under Dutch control to become the Dutch East Indies. The Malay peninsula (covering the states of Selangor, Perak, Negeri Sembilan, Johore, Malacca, Penang

and Singapore) and North Borneo came under British influence. Scant attention was paid to the loyalty-defined kingdoms in the Malay world. Hence, it is not surprising that in the post-colonial period there arose overlapping territorial and boundary claims between the different states.³

This can be traced to the failure of the colonials to take into consideration the boundaries of the feudal Malay kingdoms (which, as explained above, were loyalty-defined). This fact, coupled with the positioning of south-east Asia as raw material producers for Europe-based industries and consumers of manufactures, led to the transformation of the maritime Malay kingdoms into land-based kingdoms.

Among other things, European colonialism led to the rise of nationalist consciousness in the region. By the 1960s the Malay world excluding Brunei had become a land of independent states. Nationalism put a check on the free movement of peoples in the region with the introduction of passports and travel documents. At the same time, it meant that the Javanese or Bugis in the Malay peninsula became Malaysians while their counterparts in Java and the Celebes were Indonesians.

As nationalism and modernisation came to be intertwined in the colonies, it was the desire for the latter which provided support for the anti-colonial struggle, and thus the objective of modernising society gained centre stage in the newly independent states. In this respect it was almost certain that the governments of south east Asia would come into contention with one another. Economically they were in the main similar – producers of primary commodities such as rubber, tin, rice, sugar and coffee. This, together with overlapping territorial claims, was a potential flashpoint in regional relations.

In 1967, the Bangkok declaration led to the formation of ASEAN, which was seen as a vehicle to help defuse potential tensions in the region through greater regional co-operation. But ASEAN's capability in resolving tensions arising from competition on the economic front remained untested as the region became the theatre of cold war rivalry.

The need to contain communism led to a common stand, and Indonesia's annexation of East Timor received quiet acceptance from ASEAN and the major western powers. This is not to say that there were no issues of contention – witness the friction between Malaysia and Singapore, still alive and kicking, over the latter's separation from the former in 1965 – but they tended to be submerged by the rhetoric of the cold war. For a while, even the

end of the cold war did not cause the latent contradictions between countries to surface. South-east Asia in the late eighties and the nineties, it could be argued, was economically the most dynamic part of the world. It had attracted large inflows of foreign capital and was recording an average annual rate of GDP growth of between 8 and 9 per cent.

However, as of July 1997, the economies of the region took a beating following depreciation of their currencies amidst speculative attacks. Gone was the Midas touch of their governments, and with it their sense of confidence. The 'Asian values and Asian renaissance' debate the boom years had spawned – a debate which was set to challenge Weher's thesis in *Economy and Society* and the *Protestant Ethic* – has become a dead letter. Henceforth, the region came to be seen as reeking with cronyism, corruption and administrative mismanagement. More important, the economic crisis and impending recession also meant that competition between the countries of the region in the world market would intensify.

The boom years and the cold war had led ASEAN member countries to ignore or postpone greater economic co-operation and co-ordination aimed at harnessing the region's potential. Rather, each country acted to promote its own national interests which led to the cultivation and promotion of the sectional economic interests of the nascent national bourgeoisie. But while the needs of this bourgeoisie could be sustained in a period of strong growth, in a recession they would demand assistance from the state.⁴ This fact, together with the political pressures exerted by these countries' citizens, made the need to find solutions to the economic crisis critical.

The regional economic crisis saw citizens adopting the language of transparency and accountability advanced by spokespersons of international finance capital. There were changes of government in Thailand, Indonesia and the Philippines. In Malaysia, although there was no leadership change, the rumblings of discontentment against the government had spilled over to the streets. In Brunei, the sultan had removed his brother from the post of finance minister amidst reports of mismanagement of state funds. But Singapore stood apart: it remained an island of stability in a sea of uncertainty. This fact, together with Singapore's relatively stable economy, made it the focus of attention.

Singapore's superior infrastructure, both physical and in the services sector, had seen her development as the regional base

for foreign capital, which had penetrated the surrounding region from there. (This was also assisted by Singapore's ability to package itself as an island of calm in a turbulent sea.) Thus, the modernisation of the Malay world had greatly contributed to Singapore's economic wealth.⁵

For its part, Singapore could observe that it is her advanced status, economic and political stability and needs that has helped expedite her neighbours' modernisation. At a time when the region was economically the most dynamic in the world, the advances Singapore made tended to be marginalised. But when the economic crisis began knocking on the door of politics (to adapt Trotsky's comment on the kulaks' role in the politics of the Soviet state in the 1930s) the need to secure national interests became paramount. It is in this context that one should view Hahibie's remark that Singapore had not been a friend in need⁶ – a reference to the republic's failure to be more forthcoming to alleviate Indonesia's financial resources crunch.

Yet there is something primordial in Hahibie's rhetoric, which harks back to the glory and wealth which the region once enjoyed and which was appropriated when foreigners and outsiders exploited it. Given her predominantly ethnic Chinese population and her position in the Malay world, Singapore easily stood out as the exploiting foreigner. In this context the comment of Singaporean senior minister Lee Kwan Yew to the effect that Indonesia's economic problems were systemic did not help matters, for it revived the Orientalist perception of the colonised or natives as lazy and corrupt people. No sooner had this war of words with Indonesia subsided, Singapore became engaged in a war of the same kind with Malaysia.

Malaysia and Singapore have a long history. The latter belonged to the Sultan of Johore till 1819, when, together with 52 surrounding islands, it was acquired by Stamford Raffles and became a British possession. The two present-day states are connected by a road and rail via a causeway from Johore (Malaysia's southernmost state), along which a fresh water pipeline also runs. Under British rule, Singapore became the centre for the channelling of Malaya's exports and imports.

In 1963, Singapore and the Bornean territories of Sarawak and British North Borneo joined the Federation of Malaya to form Malaysia. Two years later, amidst bitter disagreements with the federal government in Kuala Lumpur, Singapore left Malaysia to stake out as an indepen-

dent state. When Singapore was part of Malaysia the territories which defined Singapore were not an issue, since they all constituted Malaysian territory. However, following separation the boundary issue became a centre of dispute as both states sought to redefine their territorial limits.

Malaysia's perception that Singapore had secured unfair economic benefits from her⁷ promised to raise the contention stemming from overlapping territorial claims to new heights. Thus, when Singapore announced its intention to go ahead with the transfer of her customs, immigration, and quarantine (CIQ) facilities to Woodlands in May last year it led to a war of words from both sides of the causeway, each side accusing the other of being insensitive.

To be sure, senior officials of the two states had been discussing the subject for the past three years. That agreement could not be reached stemmed from the concern of the Malaysian side that the transfer would mean the effective closure of the Malaysian Railway terminus at Tanjong Pagar (the terminus and the land on which it stands is its territory). This concern, together with the fact that the date of transfer of CIQ facilities came smack at a time when the Malaysian economy was arguably facing its greatest challenge since independence, ensured that Singapore's decision to go ahead with relocating the facilities would be contentious, to say the least.

By April 1998 the Malaysian ringgit had depreciated by some 60 per cent vis-à-vis the greenback and was continuing its downward slide; Malaysians were transferring funds to Singapore banks which were offering lucrative interest rates; unemployment figures rose as companies saddled with large debts began to downsize, and the region was experiencing a net outflow of foreign funds. All these factors led forecasters to predict that Malaysia would experience negative growth for the first time since independence. This, together with ongoing economic competition between that country and Singapore and unresolved territorial issues, led what was a fairly straightforward issue to burst into a war of words.

Among other things, this saw the Malaysian authorities campaigning for the transformation of Port Klang into a regional shipping hub and the ending of overseas trading in selected blue-chip Malaysian companies – which would make the ringgit untradable overseas. The Singapore authorities, on the other hand, threatened to take the issue to the World

Trade Organisation (WTO) and sue Malaysia for unfair trade practice.

A similar flexing of muscles in a primordial show of force took place between Malaysia, on the one hand, and Indonesia and the Philippines, on the other, following the support extended by the leaders of the latter two countries for Anwar Ibrahim.⁸ Habibie and Estrada voiced their unhappiness over the sacking of Anwar by pleading that he be given a fair trial.

Within Malaysia the sacking had drawn large demonstrations in Kuala Lumpur. The 'Reformasi' campaign he led was reminiscent of a movement which occurred in Indonesia⁹ and culminated with Suharto stepping down from the presidency. Arguably, the administration headed by prime minister Mahathir bin Mohamad was now facing the greatest challenge to its rule. More important was its potentially divisive effect on the mass of Malay supporters in the country from which Mahathir's United Malays' National Organisation (UMNO) draws its electoral support.

The economic crisis had affected the financial standing and cash flow of the national bourgeoisie, who had been nurtured by government policies and were therefore allied to the national political elites. In a scenario of slow growth competition within this class can be expected to be heightened and hence to exert pressure on the national political elite for business, contracts and financial grants/assistance. During the initial stage, when the Malaysian economy was in the early stages of a downturn, the pressure could have been contained, but it became critical as the crisis came to be more drawn out. From Mahathir's standpoint the weakening of Malaysian corporations could lead to a position in which ownership was transferred to the hands of non-Malaysians – in a new form of colonisation. It is in this context and the context of differences over the 'right' economic policy for Malaysia that the contradiction between Mahathir and Anwar should be seen.

So far as Mahathir was concerned many of the problems which had come to affect the Malaysian economy were the result of the greed of money-market speculators and traders. The prime minister had singled out George Soros and the foundation he headed as the main culprit in this context. He also indicated that the role of the media (an allusion to the foreign media) in painting the country in a negative light had done much to affect her image. Describing the strategy of the International Monetary Fund (IMF) as a recipe for disaster, he advocated a more relaxed monetary policy,

the way it becomes technically easier for Mahathir to carry through his economic policies.

This internal political development came to have ramifications for regional relations following the announcement by Habibie and Estrada that they might have to reconsider their attendance at the APEC summit. While it is well known that Anwar was a friend (and a good one at that) of both Habibie and Estrada, to construe their support for him as based purely on this misses the point. As in the foregoing discussion the support should be seen as providing Indonesia and the Philippines, which have overlapping territorial claims with Malaysia, with an occasion to assert themselves.¹² This is once again a clear demonstration of the primordial nature of the rhetoric and war of words which is an aspect of relations in the Malay world. Incidentally, it would be interesting to figure out whether events would have taken a different turn had the Malaysian authorities informed their counterparts in Indonesia and the Philippines of the decision to sack Anwar – that is, if they would still have come out in his support.

The war of words continued for about a month and seemed to have ended following Habibie's and Estrada's announcements that they would attend the summit after all.

The war of words which the leaders of the ASEAN states have engaged in appears to be contributing to contention between them. But seen as rhetoric which has roots in history and is therefore primordial, they are no more than a manifestation of the unresolved contradictions which exist between them. In this sense the situation in south-east Asia contrasts with the situation in the rest of Asia, where overlapping territorial claims often lead to military confrontations like in Kashmir and the Shikotin islands.

When 'The Singapore Story', Lee Kuan Yew's long-awaited memoirs in which there was name-calling and references to Malaysia's bygone leaders as racists and communalists, it helped carry on the war of words on Singapore's behalf – although the authorities there indicated that it was not reflective of official positions. Soon after the release, the Malaysian ministry of defence began objecting to unauthorised straying of Singapore Air Force (SAF) jets into Malaysian air space. In view of the proximity of Malaysia, SAF planes have had a tendency to stray into Malaysian air space quite often without securing prior official permission. In view of Malaysia and Singapore being members of the Five-Power Defence Agreement (FPDA)¹³ –

together with New Zealand, Australia, and the United Kingdom – such incursions had been tolerated of late. Henceforth, however, no such incursions would be acceptable without official sanction.

It may be noted in passing that the former Singapore prime minister has in his memoirs taken a swipe at the father of the present Malaysian minister of defence among other leading political personalities of the neighbouring country.

Here is another episode in the equation between Malaysia and Singapore. The American Cable News Business Channel (CNBC), a branch of Cable News Network (CNN) based in Singapore carried a live interview with members of Anwar's family. The equation improved after the Malaysian police got co-operation from Singapore for gagging the channel.¹⁴ This indicates once again the primordialism which underlies intra-ASEAN relations. In the case of south-east Asia this primordialism always makes for renewed co-operation.

III Democracy and Elitism

The governments in south-east Asia (apart from Brunei) all practise some form of representative democracy. This model, whether extremely liberal or authoritarian, is essentially a government ruled by elites. The role of the people in government virtually ends with elections to choose the rulers. The people have no part to play in deciding the shape of coalitions and the behind-the-scenes bargaining involved. Once governments are formed, they proceed with their respective agendas treating the people as objects to be moulded and made to conform with the project at hand. The geographical space which is the state assumes a character of an entity that transcends the people and in effect controls them.¹⁵ Seen in this light, the pursuit of national interests can be seen as a policy of securing sectional economic interests.

Much of the problem regarding regional co-operation in south-east Asia can be traced to the tendency of the governments there to prioritise national interests. In his discussion on representative democracy, Hans Koescheler (1995) argues how this model, which has come to be seen as the ideal form of democracy, goes against the grain of democracy as rule by the people. By arguing that democracy implies the people's direct participation in government, he shows that representative democracy contradicts this essential ingredient as it turns out to be ruled by an oligarchy.¹⁶ Among other things this has engendered a loss of confidence in the representative

model of democracy in the advanced industrial states and helped carry the debate on democracy to international forums.

This critique of democracy shows up the ahistorical nature of comments and reviews on the less developed states. In the case of south-east Asia, the view has been expressed that the debates surrounding Myanmar's membership of ASEAN and the statements of support for Anwar of Habibie and Estrada indicate the dawn of a new era in regional relations. As has been shown in the foregoing analysis, however, rhetoric has an important place in ASEAN. The principle of non-involvement is alive and well in the ASEAN region and continues to be one of its crowning jewels.

Notes

[This article has benefited greatly from the comments of professor Shamsul A B. He is the dean of the faculty of humanities and social sciences, University Kebangsaan Malaysia. Terasha kindly read and edited drafts of the paper.]

- 1 Journals such as the Hong Kong-based *Far Eastern Economic Review* in particular package themselves as experts on the region. They carried pieces highlighting the contradictions the issue of Myanmar's membership of ASEAN had engendered. Thai dailies such as the *Nation* have been very critical of the junta in Myanmar. While on the one hand the *Nation* saw the debate as positive, on the other hand it viewed ASEAN as unprogressive.
- 2 See Balasubramaniam, V (1998), *Politik Nasionalisme dan Federalisme di Malaysia*, Kuala Lumpur: Penerbit Fajar Bakti, Chapter 2. See Shaharil Talib (1996), 'The Asianic Archipelago: History Beyond Boundaries' in *Proceedings of the International Symposium South-east Asia: Global Area Studies for the 21st Century*, Kyoto International Community House, pp 89-103, for an appreciation of the idea of south-east Asia as a regional entity.
- 3 For example, Malaysia has territorial disputes with Brunei on Lumbang (Borneo), with Indonesia on the islands of Ligitan and Sipadan, with the Philippines on Sabah and a number of islands in the Sulu archipelago. In like vein there are overlapping territorial claims between Thailand and Myanmar. The list goes on as nearly all the states have overlapping territorial claims. Part of the problem stems from old treaty agreements between the colonial powers and part from the countries' right to claim 200 nautical miles as part of their exclusive economic zones (EEZs). In south-east Asia defining EEZs becomes contentious because the region is a string of islands.
- 4 In the case of Malaysia this situation has seen the government stepping in to assist cash-strapped companies by extending the non-performing loans (NPLs) period from three to six months. The government also set up asset and capital trust funds (Danaharta and Danamodal) to buy selected NPLs from financial institutions. In Thailand and Indonesia the governments there had to appeal for loans from the IMF in order to shore up the reserves of hard currency in their central banks – which will then be loaned out to over-

exposed private-sector hanks.

- 5 There is a gamut of gradualizing exercises done by students at the Department of South-east Asian Studies, University of Malaya, to show this unequal relationship. Among the more recent are: Hanizah Idris (1992), *Struktur Pembangunan Singapura Antara Tahun 1819-1929*; Siti Khajar Shah (1992), *Perkembangan Perubahan Singapura 1819-1927*; Abd Aziz Ithnin (1994), *Pelabuhan Singapura dan Sektor Perindustrian di Johor: Satu Kajian Kes Di Kawasan Perindustrian Pasir Gudang*; Fauziah Razak (1994), *Hubungan Perdagangan Sumber Perikanan Malaysia dan Singapura: Kajian Kes Kuala Sedil, Johor*; Yusrina Yahya (1994), *Tenaga Di Singapura 1819-1941: Dari Angin ke Araug Batu ke Petroleum*; Aeriiza Radzi (1995), *Kekayaan sumber Perhutanan Johor 1910-1941: Hasil Johor dan Keuntungan Singapura*; Chee Keh Chyn (1995), *Bunga dan Perdagangannya: Satu kajian kes Mengenai Perusahaan Bunga Perdagangan Cameron Highlands Ke Singapura*; Ishak Peah (1995), *Pelabuhan Singapura: Kes kajian Di Sektor Perindustrian Tanjong, Johor Baru*; Lokman Zakaria (1995), *Buruh Luar bandar ke Singapura: Kajian Kes di Kg. Bechuh Laut, Tanah Merah, Kelantan, Norhlawati Samak (1995), Aktiviti Kuptales Singapura Di geland patah, Skudai dan Kukup, Johor 1900-1970*; Thye Siew Lan (1995), *Hubungan Perdagangan Perusahaan Khinzir Malaysia-Singapura: Kajian Kes Puya Mengkuun Melaka*.
- 6 See *Asian Wall Street Journal*, August 4, 1998.
- 7 See note 5.
- 8 In Malaysia's communal political set-up, UMNO is the leading member of the ruling *Barisan Nasional* (national front) coalition of 14 political parties. The leader of UMNO is the chairman of *Barisan Nasional* and holds the post of the prime minister as well. For a discussion of politics in UMNO, see Shamsul A. B., 'Battle Royale: The UMNO Elections of 1987' in *South-east Asian Affairs*, Institute of South-east Asian Studies, Singapore, 1988; Fan Yew Teng, *The UMNO Drama: Power Struggles in Malaysia*, Egret Publications, Kuala Lumpur, 1989; Vejai Balasubramanian, 'Vote for Unity: Malaysia's Ninth General Election' in *Economic and Political Weekly*, No 23, June 10, 1995.
- 9 The demands of the two movements for greater transparency, accountability and an end to cronyism in government were similar.
- 10 For a discussion on aspects of the role of the government in creating the national bourgeoisie viewed from the standpoint of rent capitalism, see Gomez and Jomo, (1997), *Malaysia's Political Economy: Politics Patronage and Profits*, Cambridge University Press, Cambridge. Chapters 4 and 5 of the book give details on businesses which benefited from relations with the national political elites.
- 11 Following his sacking from the government Anwar has come to lead the Reformasi (movement for reformation) some of whose leading lights come from ABIM (the Islamic youth movement of Malaysia). In pressing for greater democracy the movement hopes to rectify the bias of the Mahathir administration accountable to cronyism. It would be well to point out that the demand for greater democracy has as its objective the extension of larger economic benefits to the Malays. Mahathir is seen as favouring the non-Malays. The new economic policy (NEP) which

was introduced in Malaysia following the racial riots of May 1969 had as its central goal the upliftment of the economic condition of the Malays in particular. But while the NEP did help to improve the economic condition of this ethnic group, it also worked to the advantage of the non-Malays who were well poised to take advantage of its general pro-business thrust. In Malaysia's communal political set-up it is all too easy for politicians to argue that the gains of the non-Malays had been at the expense of the Malays and that political expediency was the culprit. The problem becomes more acute in a period of economic slow down.

It is in this context that the Reformasi and its ability to attract support from large sections of the Malays should be seen. It is revealing that despite adopting the language of greater democracy the campaign does not, for example, seek to address the communal bias of the Malaysian constitution: despite equal citizenship status, the non-Malays are not granted access to government jobs, places in universities, and grants on a par with the Malays. The demands for democracy adopted by the Reformasi lack an idealist component, as can be discerned from their embracing representative democracy without questioning its elitist character and the denial to individuals of opportunities to participate directly in the political process.

- 12 The Phillipines has laid claim to the Malaysian state of Sabah and Indonesia to Ligitan and Sipadan, both in Malaysia. These disputes arose from interpretation of the 1877-78 Treaty of Rome, which divided the Sulu and Celebes seas between Spain and Britain.
- 13 The Malaysian minister of defence recently announced that a study on the effectiveness

of the FPDA would be made to analyse its continued relevance for the future.

- 14 In this context, Singapore is well known to have very tight control over the media. In previous years, print media such as the *Wall Street Journal* and the *Far Eastern Economic Review*, for example, have been proceeded against and their circulation severely restricted.
- 15 This idea of control is adopted from the Zygmunt Bauman study on modernity. See, for example, "On Globalisations: Or Globalisation for some, Localisation for some others", *Thesis Eleven*, No 54, August 1998:37-49. Of the critiques of the representative model of democracy Noam Chomsky stands out. But see also Hans Kochler (1995), *Democracy and the International Rule of Law: Propositions for an Alternative World Order*, where he develops and advances the critique both at the national and international levels from the standpoint of Kant's philosophy of *Practical Reason*.
- 16 Sociologically, it is possible to understand this criticism as a product of modernity and the promise it held for man. The resulting pluralism this criticism encourages is indicative of a shift to the post-modern. Post-modernism is seen as a critique of modernism and its product. While this shift to post-modernism has, among other things, helped to enhance the role of individuals in the political process in the advanced industrial countries and contributed to greater democratisation nationally, it is not reflected internationally. Here, the governments, and to an extent the people of the developed west continue to act hegemonically and undemocratically, as may be discerned from the actions of the US, for example.

COURSE ON METHODS IN LABOUR RESEARCH

V. V. Giri National Labour Institute is organising a Course on Methods in Labour Research during December 01-21, 1999. The course is meant for young researchers and teachers of the universities/colleges/research institutions and the professionals in government organisations who want to pursue their research interest in various labour related themes. For application form and other details please contact: E. K. Sasikumar/Babu P. Remesh, Course Directors, Course on Research Methods in Labour Research, V. V. Giri National Labour Institute, Post Box No. 68, Sector 24, NOIDA-201 301, Distt. Gautam Budh Nagar (U.P.) [Fax Nos.: 011-8-532974 & 011-8-535174]. The last date for the receipt of the completed application forms is **November 15, 1999**.

Employment in Smaller Indian Firms

Choices under Liberalisation

Mark Holmstrom

How can Indian decision-makers take advantage of liberalisation to achieve economic growth and competitiveness, not as ends but as means to welfare and choice, social and sexual equality, and good work? Most new employment must be in small and medium enterprises, which have achieved some of these things elsewhere. Reviewed here are policies tried in India and elsewhere: protectionism plus privileges for small firms; 'real services' to promote flexible specialisation (Italy, Spain); long-term relationships between large firms and subcontractors (Japan); liberalisation to the limit (Britain, the US); education and training; promoting entrepreneurship, etc. Recent work on industrial districts suggests that Indian variants of flexible specialisation are emerging and can be promoted by suitable policies.

I

More vs Better Employment

LIBERALISATION has arrived: there can be no going back. How can Indian decision-makers take advantage of it to achieve economic and social goals: growth and competitiveness, not as ends in themselves, but as means to greater welfare and choice, starting with the elimination of gross poverty; and then other goals like social and sexual equality, good working conditions, and the chance for most people not just to make a living but a satisfying career?

Everyone talks of liberalisation, globalisation and flexibility, but these words are imprecise. Liberalisation could mean no protection for domestic industries, and no state intervention except law and order and sound money; or simply less protection than before, with other measures to promote economic growth. Globalisation can mean letting foreign capital in, with or without strings. It involves centralised planning by large companies with world-wide markets, but it also provides new chances for decentralised production by a myriad of smaller firms and local clusters, using local skills and new technologies to supply world markets.

'Flexibility' is the most dangerously ambiguous of these words:

Flexibility...can take the form of 'active versatility' or 'passive pliability' [Semlinger 1990]: that is, it can consist of the ability to exploit market niches and quickly respond to orders, based on a skilled and polyvalent labour force; or it can also mean simply to submit to outside pressures from customers, and to accept cutbacks, and to pass on the flexibility requirements of the market to the workforce in a coercive manner through expanding and retrenching production volume, forcing wage concessions, making 'flexible' use of short time and casual

employment, etc [Sengenberger and Pyke 1992:14].

Sengenberger and Pyke (1992:12) call these the 'high road' and the 'low road' to industrial restructuring. The 'low road' consists of seeking competitiveness through low labour cost, and a deregulated labour market environment. It is believed that cost-cutting will boost productivity and profits, and create new employment...The problem with this approach is that the improvement it yields for competitive performance, if there is one at all, is frequently short-lived...Poor wages and terms of employment hinder the firm in acquiring and keeping the qualified labour required for efficiency and flexibility; and they rarely induce the firm to 'invest' in its labour force to make it more productive. The principal alternative to such 'destructive' competition is the 'high road' of constructive competition, based on efficiency enhancement and innovation...through economic gains that make wage gains and improvements in social conditions feasible, as well as safeguarding workers' rights and providing adequate standards of social protection [ibid:12-13].

Must liberalisation in India mean taking the low road, or are there other options?

Some of the Asian Tigers, like South Korea, started their industrialisation on the 'low road' and then moved gradually to a higher one. India is not yet in a position to join the Tigers, because of lower levels of education and entrenched social inequalities, and for other obvious reasons. In some ways it is closer to China, except that it has not come anywhere near China's recent economic performance: never mind China's dismal record in human rights.

There are hard choices to make, trade-offs between good things, cakes we cannot have and eat at the same time. Economic growth is good, and in the long run it may benefit everyone or their grandchild-

dren; but we are often told that the cost of growth, at least in the short or medium term, must be harsh insecure low-paid work, great inequalities, and loss of freedom and human rights. Or perhaps not: evidence from the 'Asian Tigers' suggests that some degree of social and economic equality, far from being inconsistent with rapid growth, may be a necessary or favourable condition for it. Perhaps the 'low road' is not the only one for a poor country.

All these debates involve questions of fact (which can sometimes be settled by evidence) and value (which cannot): means and ends. If you think it best to make the road as high as possible, we have to recognise that it cannot be very high in India yet.

The pace of economic and technological change in India is set mainly by large firms, including publicly owned ones; but most new employment will have to be in small and medium enterprises (SMEs) – the 'rural non-farm sector', urban petty manufacture, trading and services – with as rapid a shift as is feasible towards more skilled work and higher technologies, to take advantage of the many skilled and educated people.

India, being very big, has large numbers of educated workers, besides an even bigger reserve of uneducated often illiterate people, and everything in between. The Tigers' experience suggests that the first priority must be education. But it will take time; and though universal education may be a necessary condition for economic growth, it is not sufficient. What more needs to be done, to get growth with welfare and justice?

As a foreigner, it is not my business to tell Indians what choices to make, yet it would be disingenuous to pretend I have no views. These are, roughly, social democratic ones, which many Indians share.

But I can contribute to the debates about liberalisation and flexibility, and suggest lessons to be learnt from foreign experience. This paper grew out of my field-work. In 1993 I made a study of electronic and engineering industries in Bangalore (with later visits to follow new developments). In 1996 and 1998 I visited the Valencia region of Spain, especially the toy-making town of Ibi. My own country (Britain) has not been a good model. A British observer can at least warn of the dangers of the uncritical free market worship of some Indian business people and journalists, who sing Thatcher's praises. Elsewhere I discuss the effects liberalisation has already had, and is likely to have, on Indian business [Holmstrom 2000]; and the consequences for different kinds of workers, both educated and uneducated [Holmstrom 1999a].

In earlier articles [Holmstrom 1993a, 1997, 1998a] I considered whether some variant of the 'Third Italy' or 'Emilian' model of flexible specialisation and industrial districts might work in India, leading to economic growth and good work for more people: what were the chances it might develop spontaneously, or what – if anything – could public policy do to encourage it? Here I range more widely over other possible ways of achieving these ends, and update the discussion of flexible specialisation and industrial districts in the light of recent work on SMEs.

What can be learnt from public initiatives to promote SMEs, with social justice, in countries which have done so successfully, like Italy, Germany, Japan, Denmark and Spain? Can their institutions and policies be adapted to achieve good results in India? Cultural, economic and political conditions differ so much that you cannot simply copy what has worked well in one place and get similar results elsewhere: it has not been possible to repeat the success of Third Italy's industrial districts even in southern Italy. Yet there are cases where a successful model has been learnt from and adapted creatively. Third Italy may not have fathered any useful progeny in southern Italy, but it has in Spain, where the Valencian regional government has a successful programme-based directly on the Third Italy ('Emilian') model plus Denmark [Pyke 1992a; Ybarra 1991]; or the Cyprus Industrial Strategy, built on Emilian foundations [Murray 1992]. For years western firms struggled to adapt their own management practices to very different cultures in Asia: now Japanese firms are doing the same thing in their

European subsidiaries, especially in Britain – a reversal of an older relationship between the west and the rest [Kaplinsky and Posthuma 1994]. Social experiments sometimes work.

But how can I compare a poor third world country, with a vast illiterate or half-educated population, with these rich countries? The speed with which the Asian Tigers have moved from being seen as underdeveloped countries needing help, to world leaders, shows the dangers of the mental apartheid involved in placing countries in the first or third world, the west or the rest. The Tigers may seem to be trapped at the moment, but they have such reserves of strength that they are likely to break out of their cages soon.

Given that you cannot transplant a successful model from one environment to another, it is worth asking whether we can apply the lessons intelligently in a different and poorer society. If something was done successfully in another economic and cultural setting, should we expect it to work if tried somewhere else (in this case, India)? And if not, why not?

First, what is to count as 'working' – what criteria for success? Economic growth? Employment? What sort of employment – work on any terms, at low wages, in bad conditions? Or good careers with decent pay and conditions and a future? Employment for whom – women who want or need paid work, hitherto poor and excluded groups, or ethnic minorities? So, in judging the success of an experiment or initiative, ask which of these ends it has achieved, and whether there are trade-offs: does growth require greater inequality, or child labour, or lack of freedom, at least for some time? The trade-offs may be matters of fact (though hard to determine and fogged by our values and prejudices).

It is easy to find reasons why a foreign model would not work. We could develop an experimental method, on roughly popperite lines. Start with the hypothesis that a particular model can work (produce the results we want) in India, then try to falsify the hypothesis by looking for reasons why not (for example, the model has already been tried and shown not to work) or reasons why we should expect it to be very difficult (Japanese-style management is unlikely to work with poorly-educated workers). Experiments in social engineering are difficult to make and have a high human cost, which is not always a reason for not trying. More often we have to rely on controlled observation, as in meteorology or astronomy, not experiment.

II Policy Options

If we succeed in falsifying the hypothesis – that what worked well somewhere else can work in India – then we should either abandon the hypothesis, or adapt it to see whether our new-model hypothesis can be falsified. For example, if Japanese-style management has not yet achieved much in India (though it has in Britain), are there conditions in which it is more likely to do so?

So consider some policies which have been tried, or proposed, as ways of promoting economic growth and employment, especially in SMEs. What reasons might there be for thinking that each of these options would, or would not, work in India now?

Option 1: Protectionism, plus special privileges for small firms ('small-scale industries') to offset the massive advantages enjoyed by big firms hiding behind tariff walls. In other words, the policy India has followed for most of the past 50 years.

Protectionism helped one country after another to build up industries which then became vigorously competitive on world markets, but that time has passed. Almost everyone agrees that protectionism went on for too long. Infant industries never grew up; quality was poor; India was overtaken by smaller countries which started later. Anyway protectionism has gone or is going. There is little point in going over the reasons for its demise once again, or the arguments against it. Protectionism is dead.

The policy of reserving product lines for small firms is not quite dead, but very sick. It was counter-productive for many well-known reasons [Holmstrom 1984]. It was open to abuse and fraud; it encouraged inefficiency and poor quality; it was an excuse for appalling working conditions; and so on. There are plenty of good small firms in India, but they did not need the policy (an overgeneralisation perhaps, but broadly true).

Option 2: Liberalisation to the limit. Remove nearly all controls, keep taxes low (so nothing to spend on subsidies, incentives, state services to business, etc), because state intervention invariably does more harm than good. Then, the argument runs, the invisible hand will solve all problems. Putting free market institutions in place will automatically call forth reserves of entrepreneurship, whatever the culture. Those who seriously want to get rich will seize the opportunity, and development will surely follow. Everyone or most

people will benefit in the long run, though the short run may be tough. This was supposed to happen in Yeltsin's Russia, or Thatcher's Britain. If small firms have a place in this free-market development, they will survive; if not, not. But they probably will.

This policy has not been tried in India, which may be one reason why it is such a popular candidate in some economic and business circles. It is doubtful whether it has really been tried anywhere else. Even Reagan and Thatcher did not practice what they preached: the social and electoral cost would have been too high. Anyway they were dealing with rich economies, and the success of their policies is questionable. The Tigers, with the possible exception of Hong Kong, had actively interventionist governments which planned, protected, picked winners, and committed all sorts of sins against the free market. Moreover they had the advantages – which India has not – of a relatively equal distribution of wealth, and above all a population not merely literate but well educated; which leads to Option 3.

Option 3: Put everything into state-funded education and training, which is expensive but the best bet. Then let the private sector shift for itself. Other state intervention, incentives and controls are optional (see South Korea and Taiwan).

This is a strong candidate. If Kerala – a relatively poor state – can achieve universal education and literacy, then others can if the will is there. But the task is immense: and even if universal education is a necessary condition for economic development, it is even further from being a sufficient one in India than in the legendary Tigers. Besides, there are other urgent calls on the public purse (health, the right incentives to industry, etc), as well as the non-urgent but politically irresistible ones.

Option 4: Identify, train and encourage entrepreneurs, the critical scarce resource. Entrepreneurship is seen as a matter of personality, susceptible to psychological engineering. If there are enough well-motivated and trained entrepreneurs around, economic growth will follow as night follows day.

In the extreme form of this argument (still alive in India and elsewhere) entrepreneurship is seen as a special sort of mind-set, which will triumph over all obstacles: a treasure to be sought for, husbanded and nurtured, even inculcated in the young. Thus David McClelland saw 'the need for achievement', or 'nAch', as a 'mental virus' which makes people 'behave in a peculiarly energetic way'

[McClelland 1966:28-29]; 'a causative factor – a change in the mind of men which produces economic growth rather than being produced by it' [McClelland 1963:83]. 'The psychological factor responsible for a civilisation's rising to a challenge... has been weighed and measured and scientifically estimated in advance; and, so far as we can now tell, this factor is the achievement motive' [ibid 95]. McClelland [1966] claimed to have conducted a successful experiment in 'infecting' a group of Indian businessmen with this virus.

This is an extreme version of a more widely held view of entrepreneurship and the entrepreneurial personality as necessary or even sufficient conditions for development, things which can be inculcated by training and example. Much effort has been put into training entrepreneurs in institutes and business schools in India, on more realistic lines than McClelland's psychological engineering.

It is equally plausible to argue that entrepreneurship is just a link in a causal chain: wherever the political and economic structure provides opportunities for entrepreneurs they will emerge and succeed, like rabbits. I maintain that entrepreneurs are a valuable resource but not the critical resource which makes all the difference: not rare and valuable creatures like racehorses, nor common as rabbits, but useful animals like bullocks, which sometimes work best alone, sometimes in teams [Holmstrom 1999b]. Anyway there is no shortage of them in India. A tradition of sometimes ruthless entrepreneurship has always been strong, though not equally spread throughout all communities.

Indian and foreign experience suggests that training programmes for entrepreneurs are useful but not the most urgent priority. As Schmitz and Musyck (1993:12) argue, providing training 'is easier than changing the context in which small enterprises operate... Training can have an ideological function in that the obstacles are seen in the people who run the enterprises rather than in the (often hostile) environment in which they operate.' Training schemes for small-scale businessmen have been useful elsewhere (Italy, Spain) as a part of broader programmes to give advice and consultancy, and to train skilled workers at all levels of the enterprise.

This discussion of policy options (protectionism with privileges for small firms, liberalisation to the limit, putting everything into education, and training entrepreneurs) was a curtain-raiser to policies more directly aimed at creating growth and good employment in small

and medium firms, in conditions of liberalisation. This is not a matter of principle – small is not beautiful – but most of the employment is bound to be in these firms, even if large firms call their tune. With the worldwide trend towards decentralised production, even many large firms come to resemble federations of small firms in some respects, though with centralised arrangements for marketing, R and D (research and development), etc. The distinction between large firms and small becomes blurred. The 'small-scale sector' is dead: long live the many vigorous innovative small firms.

How can India get the relation between large and small firms right, to achieve the results we want (like economic growth, employment, satisfying work and greater equality)? Let us look at some forms this relation has taken in other countries, in each case asking why – if something worked well somewhere else – it might not work in India.

Option 5: Subcontracting on the open market. Large firms dominate the economy with their own marketing networks, well known brand names, and R and D. They have always sourced some components and services from outside: now they are less inclined than ever to combine the different stages of manufacture in-house with expensive permanent employees. They maintain the smallest possible core workforce, some workers on short contracts for jobs which must still be done in their own factory, and put out the rest to small firms which can meet their standards of quality and delivery. So the large firm employs less and less people. In the extreme case, it is reduced to a 'virtual company', a commercial empire like Benetton, ordering goods made to its precise specifications from a multitude of small suppliers and selling them through franchised retailers [Murray 1985].

The large firm's relations with small entrepreneurs are transient and impersonal in Robert Kuttner's words, 'every business relationship is a one-night stand'. Cosy relationships of trust between businessmen, paternalistic or trade union protection of labour, all these are suspect. Smaller firms compete ruthlessly among themselves for orders to supply components and services to the large firms, which are always on the lookout for firms which can supply them cheaper, faster and better.

This model has the advantages and disadvantages of 'low road' flexibility. Costs are driven down relentlessly to meet domestic and international competition. A poor country can maximise its comparative advantage, which is cheap labour. The

disadvantages are not only the social costs, but the economic costs of failing to invest in and upgrade labour, or to reap the benefits of trust between and within firms.

Open competitive subcontracting seems the most likely course for Indian firms to take in the short run: to build on the existing pattern in much of Indian industry, while tightening up on costs and quality in response to the new competitive pressures. Much of Indian business has always been a jungle, where trust was limited to kin and close friends, or to close-knit moral communities bound together by religion or caste, like the shoe producers of Agra [Knorrina 1994, 1998].

Option 6: Japanese-style subcontracting. Large firms maintain close long-term relationships with small subcontractors: a marriage rather than a one-night stand. Decentralised flexible production within the parent firm extends also to satellite suppliers, who are involved in continuous improvement and forward planning.

This could develop in India, building on the existing social and economic links between large and small firms in some industries and places: smaller firms set up with the active assistance of ex-employers, as dependable suppliers; family firms subdivided among the founder's kin – Pierre Lachaire's (1992) 'Industrial Lineage Firm'; or recognised ancillaries, which Indian governments have promoted for many years in a drive to encourage small-scale industries. Public sector firms, in particular, developed stable relations with entrepreneurs, often their own former managers or workers, who could count on long-term contracts. The ancillaries made little or no contribution to improvement or innovation (if there was any improvement or innovation at all).

Up to a point, this policy worked. Small firms got a chance to come up, and provided training on the job to workers who had failed to get into the prestigious big firms' training programmes and apprenticeships. The parent firms had assured sources of supply by entrepreneurs who could meet their (often relaxed) standards of quality; and much more cheaply, since the big factories, especially in the public sector, had high wage bills and townships, factory buses and fringe benefits to pay for. Workers in the small firms had only as much security as paternalistic employers or scarce skills might give them (scarce, that is, at a low wage). Working conditions varied from tolerable to appalling.

Close ties between managers in the parent and auxiliary firms gave rise to allegations

of inefficiency at best, corruption at worst. In the present drive for quality and cost-cutting, these cosy relationships have increasingly been replaced by open competitive tendering ('one-night stands'). Many small suppliers have gone out of business. Others have diversified. More rarely, they have formed consortia for marketing or to develop new products.

The old policy of 'ancillarisation', impelled by the public sector, may now be replaced by long-term co-operation between large private firms and newly formed ancillaries, able to meet the large firms' demanding standards of quality and cost. 'One-night stands' are cheap but risky. Large firms can invest in a stable committed workforce, not expensively in-house, but indirectly through small firms which pay less but still offer relatively stable employment, training, and even some degree of participative management.

The Japanese example has a powerful impact. Indian employers and managers study it, discuss it and claim to emulate it. Many of the cultural conditions for Japanese-style management – assumptions about long-term trust and loyalty to an organisation, freedom to criticise within an unchallenged hierarchy – may be as rare in India as they are in many western countries, even if the Japanese have adapted some management practices successfully in their factories abroad [Kaplinsky and Posthuma 1994]. Of course these cultural conditions may be stereotypes of Japanese society, or that society as it was but no longer is. The point is that this is how Indian businessmen – and westerners – see Japan and take it as a model.

Option 7: Flexible specialisation Italian style: can it develop spontaneously? Fordist mass production is replaced by decentralised production and less hierarchical management. Firms innovate constantly, using multi-purpose machinery and workers who are always learning new skills, to supply fragmented and rapidly changing markets. Large firms are broken down into smaller decision-making units, while networks of smaller firms (usually but not necessarily in the same industrial district) complement each other to achieve economies of scale and scope ('collective efficiency'). They co-operate on marketing, improving quality, developing new products, and stages of production for which some firms have specialised machinery or workers. This allows them to do things they could not do if they were isolated in a jungle of competing firms. They are interdependent, and independent

of the large firms when this is to their advantage.

This is sometimes called the 'Emilian model', because the most striking examples have arisen over the past 30 years in the industrial districts of north-central Italy, the so-called 'Third Italy' [Bagnasco 1977], especially the region of Emilia Romagna:

It [flexible specialisation] is seen in the networks of technologically sophisticated, highly flexible manufacturing firms in central and north-western Italy. Flexible specialisation is a strategy of permanent innovation: accommodation to ceaseless change, rather than an effort to control it. This strategy is based on flexible – multi-use – equipment; skilled workers; and the creation, through politics, of an industrial community that restricts the forms of competition to those favouring innovation. For these reasons, the spread of flexible specialisation amounts to a revival of craft forms of production that were emarginated at the first industrial divide [in the 19th century, leading to fordist mass production] [Piore and Sabel 1984: 17].

Flexible specialisation requires some degree of trust between entrepreneurs, and between them and their workers. It could develop spontaneously, as local entrepreneurs see the advantages of acting together and develop effective sanctions against cheats and free-riders. Thus the Morbi Flooring Tiles Manufacturing Association in Gujarat tries to stop unscrupulous manufacturers who use inferior materials for a quick profit, tarnish Morbi's image, and put pressure on other manufacturers to cut standards [Das 1996a: 14-16; 1996b: 24]. Yet Indian entrepreneurs, especially those with a financial rather than a technical background, have generally been suspicious of anyone outside – and sometimes inside – their own family, caste or religious community, and unwilling to share information.

However there are many documented cases of local networks of firms, including innovative and successful ones in fast-developing industries, which have developed effective networks of informal co-operation, based on economic interest and personal friendship, sometimes cutting across communities of birth (see Tewari (1995, 1998) on Ludhiana's engineering industry, and Holmstrom (1998b) on Bangalore's electronic and engineering industries). Or these networks develop within business associations of firms in the same industrial sector or simply in same place, like an industrial estate (see

Benjamin (1993) and Benjamin and Bengani (1993) on the politics of industrial districts in Delhi; or Gorter (1996, 1998) on a business association in an industrial estate in Gujarat). More rarely, firms join consortia for marketing or to develop new products (see Holmstrom (1997), and (1998h:208-13) on Bangalore and Coimbatore).

Effective networks of co-operation, capable of making India's SMEs competitive on national and world markets, are unlikely to take root without a push, a deliberate policy by national or local governments to encourage this kind of development. This is what happened in Italy, Germany and Denmark. The problem is to devise the right kind of push: governments can easily push in the wrong direction, or waste resources on projects for which there is neither a local demand nor an unrealised need.

Option 8: Policies to encourage flexible specialisation. In the 'Third Italy', flexible specialisation was rooted in special historic, economic and cultural conditions, the tradition of combining artisan work with agriculture in share-cropping extended families, and close interdependence between town and country. These conditions cannot be replicated, even in other parts of Italy. But flexible specialisation was not entirely a spontaneous growth: it was also the result of resolute policies, introduced not by the corrupt and inefficient national government but by local and regional governments, which worked deliberately to build competitive industrial districts. They did this mainly by collective provision of what the Italians call 'real services' (*servizi reali*) like training, consultancy and design, which single firms cannot afford by themselves; and by encouraging and supporting consortia or other local arrangements, which gave clusters of interdependent SMEs access to European and world markets.

The strategy had many thrusts. One was targeted at particular industries. Local and regional governments, working with private enterprise and sometimes trade unions, set up institutes to provide technical services, research and development, testing, feasibility studies, advice on management and marketing or whatever was needed, aimed at a particular industry or users of a certain technology, wherever it was to be found in the region. The strategy was to develop what existed, anywhere in the region, and to find ways of diversifying into new fields and markets.

This strategy, aimed at particular industries, shaded into a strategy of specifically local development. Each industrial dis-

trict has grown up around a type of product or a range of complementary products: in Prato, textiles and textile machinery; in Modena, agricultural machinery; in Faenza – a centre of fine ceramics since the Middle Ages – modern ceramics and machinery for the ceramic industry. An industrial district has a dense network of small firms, each specialised in particular technologies or stages of production but always ready to seize new opportunities, to build on what it knew in order to develop new products: it is specialised and flexible at the same time. Business associations, trade unions, political parties, consortia and co-operatives have worked together, through local government and opinion, to create economic institutions tailored to the special needs of local industry and labour. There is not really a single 'Emilian model', but a lively political culture, and a habit of adapting institutions and practices, which have worked well somewhere else, to the needs of each industrial district.

In Germany, the Steinbeis Foundation, established by the Baden-Württemberg state government, set up a network of technology transfer centres, closely linked to local chambers of commerce. These centres are demand-driven and almost self-funded. They usually specialise in particular industries and technologies, and often refer clients to other centres with the necessary expertise [Pyke 1992b]. The Cyprus Industrial Strategy was a conscious and apparently successful attempt to apply lessons from Emilia Romagna [Murray 1992].

In Spain, more recently, the Valencian regional government established a high-profile agency Impiva (Instituto de la Mediana y Pequeña Industria Valenciana, Institute for Valencian Medium and Small-Scale Industry), again in a conscious attempt to adapt the Emilian model to local conditions. Since local governments in Spain are weaker than in Italy the initiative comes from the regional government. Impiva makes an explicit distinction between two kinds of institute, which complement each other: 'Technological Institute', each aiming to develop a particular industry or technology, and local business innovation centres (CEEI, Centros Europeos de Empresas Innovadoras) not tied to any industrial sector [Pyke 1992a].

Some of the Valencian technological institutes are designed to help a distinct industrial sector (shoes, toys, textiles...) and are based in towns where these industries are concentrated, though they provide services to firms anywhere in the

region, or sometimes outside it. Other institutes aim to develop particular technologies, like biomechanics or optics, which are used in diverse industries. Each institute is linked to an association of entrepreneurs, who elect a majority of its supervisory board and are supposed to determine the services the institute will provide, for a fee. The institutes are, or are meant to become, self-financing.

The locally-based business innovation centres, partly funded by the European Union, complement the technological institutes for existing industries by investigating, promoting and subsidising promising innovative projects of any sort in a local area. On recent visits, I found general agreement among entrepreneurs, academics and trade unionists that the technological institutes are useful, even essential to industries like toys which face stiff international competition. Opinion was more divided about the business innovation centres' achievements so far. However a technological institute originally established to promote a locally dominant industry, like toys, may in practice take on a dual role as a local development agency for other industries as an industrial district diversifies. (See two recent reports, not yet published, on the toy-making cluster around Ibi [Albaladejo 1998] and on AIJU, the technological institute for the toy industry [Holmstrom 1998c].)

Another element of Impiva's strategy, modelled on Danish practice, is the use of 'brokers' to promote 'co-operation networks' (*redes de cooperacion*), small groups of entrepreneurs who agree to work closely together. This appears to have had very little success. These fiercely individualistic entrepreneurs value the institutes' services but are only prepared to trust each other to a limited extent: a situation with many parallels in India.

Some enthusiasts may have idealised 'flexible specialisation', and the Third Italy in particular, as a panacea, a model of social justice, harmony and economic success: the 'high road' for SMEs. If the model is crude and oversimplified, or packs in too many things which do not always go together, we should unpack it and examine the institutions and policies separately, in their original setting, and ask how some of them might be adapted for use elsewhere.

Allowing for exaggeration, it is still clear that clusters of interdependent SMEs in some regions, but not others, have combined the advantages of smallness with the economies of scale and scope which big firms enjoy; that this can give small

firms the strength to choose either to supply the large firms, or to compete with them; and that it can lead to rapid economic growth, good wages, and good interesting work for men and women, in an environment where they are constantly learning new skills and developing their talents. These small firms have achieved this by working together; by establishing unwritten ground rules to regulate conflict between entrepreneurs and between employers and workers; by taking advantage of 'real services' promoted by local and national governments; and by a political culture of widespread participation through business associations, parties and unions.

Could something like this happen in the very different conditions of India? I have mentioned the most obvious difficulties: great social and economic inequalities, widespread illiteracy, strong incentives for employers to take the 'low road' rather than investing in and retaining labour. Cut-throat competition, as well as communal divisions, make entrepreneurs too suspicious to share information or to develop stable forms of co-operation. On the other hand, there is evidence not only that such forms of co-operation have developed spontaneously in some places, but that some – not all – of the services provided by national and state governments, or by business associations, have helped smaller firms to do things they could not do by themselves.

The nationally-funded small industries service institutes (SISIs) have existed for years in all major cities, and provide a range of services under one roof: technical and market advice, training courses for workers, testing and machining which small firms lack the equipment or skilled labour to do for themselves. Their resources are spread too thin, because – at least in the past – they had to help all 'small-scale industries' indiscriminately and could not target their efforts on firms and industries with real prospects for growth; but this can be corrected. Industrial Training Institutes, which provide diploma courses for school-leavers, have been a qualified success, though they lack the up-to-date training facilities of the big factories. Specialised institutions like the CMTI (Central Manufacturing Technology Institute, formerly the Central Machine Tool Institute) in Bangalore [Holmstrom 1998b: 216-17], or the Central Leather Research Institute in Chennai, provide useful services to large and small firms all over India, and have a major impact on the relevant industries in regions where they are established (like the

technological institutes in Valencia, which are set up to serve an industry throughout the region but in practice are most useful to local firms).

Specifically local institutions providing technical and advisory services are controlled not by local but state governments; sometimes by business associations like KASSIA (Karnataka Small Scale Industries Association [Holmstrom 1998b:213]), which have moved away from their traditional role as pressure groups wringing concessions from governments, towards providing services to members; or by voluntary associations like the Nettur Technical Training Foundation (NTTF) with seven excellent training centres throughout south India, supported by profits from its own factories and consultancy. Some state governments have asked the NTTF to help set up similar institutes in their own states [ibid:217-18: 224].

There is some evidence [Holmstrom 1997] that public provision of 'real services' in India can not only make up for lack of trust between entrepreneurs, but can sometimes build trust by demonstrating the advantages of consortia and co-operation, and by building up solid friendships and social networks, cemented in social clubs like Rotary and Lions, professional associations of engineers or specialists, and the new culture of seminars and conferences which attract ambitious entrepreneurs and managers.

'Real services', then, can be useful both in doing what they are set up to do (training, help with marketing, testing, etc) and indirectly, in building solidarity and trust, laying the foundations for useful co-operation and the networks of social and moral relations which make 'collective efficiency' possible: not only in the relatively hi-tech industries which face the stiffest international competition, but also in more traditional industries. Thus Mathew and Joseph (1994a; 1994b) and Mathew (1995) have shown how the right type of 'real services' could improve competitiveness, wages and conditions in traditional cottage industries like Kerala's cane and bamboo industry.

Option 9: Involve trade unions in any policy initiative, to prevent small as well as large employers from taking the easy option of cutting wages and job security (the 'low road'), and to force them to invest in a committed well-trained workforce. This has happened in the social democratic economies of western Europe. In Italy and Spain, most firms except very small ones have works councils and union

representation established by law. Unions are formally involved, along with employers' organisations, in the institutions which provide 'real services' to SMEs. Among factors accounting for the success of Baden-Württemberg's SME policy, Pyke (1992b:29) lists 'the effects of trade union and other institutional pressure to block off other routes – or 'low road' routes – to competitiveness.'

There are two possible objections to this argument. One is ideological: 'Institutions and rules aimed at regulating competition are seen as mere strait-jackets, and should be kept to a minimum' (Sengenberger and Pyke (1992:12) report this view but do not share it). Unions interfere with the beneficial working of flexible labour markets: they cause unemployment by pricing workers out of jobs. They no longer protect workers' interests even if they once did, or only the interests of the lucky few with permanent jobs. They are an anachronism, with no place in the modern world. Or, even if unions have a legitimate place in large firms, they have no place in small ones, where they disrupt the close personal relations between employer and workers, and deprive small firms of the main advantage – cheap flexible labour – which allows small firms to compete with large ones, and to employ those who cannot get into large firms.

Another possible objection is practical. Even if it is desirable that unions should protect workers in small firms, they are not equipped to do so:

Trade unions have expressed reservations about policies aimed at promoting small firms given the relative weakness, if not absence, of their organisations in that sector. A basic problem is that the organising of the small firms sector, and the provision of trade union services in that sector, are far more costly, far more difficult, and far more complicated than is normally the case in large firms [Sengenberger and Pyke 1992:24].

This is even more true in India than in Europe. Unions are weak and poor, partly because of low subscriptions. They are divided along political lines, and some are dominated by careerist leaders. Only a few unions have ventured seriously into the 'small-scale sector', and their achievements have been of limited value to labour. Yet there are encouraging signs of new thinking and effort in some unions, with idealistic, usually middle-class, leaders employed in large firms, who are looking for ways to give effective support to workers in smaller units.

In their own members' interests, and as a matter of social justice, Indian unions

should pay far more attention to workers in smaller units, and to the unemployed. If union activists are genuinely looking for ways to help these people – as some of them are – they must come to terms with the market and the new competitive climate; and employers must come to terms with unions. Most large employers have done so: for smaller firms, this is a bitter pill to swallow. Unions are right to defend job security, but they should push explicitly for retraining – something they have usually left entirely to managements – and for careers, rather than mere jobs. Unions should democratise their own structures, in parallel to, and as a lesson in, participative management. None of these ends will be easily achieved.

Option 10: Labour-managed enterprises, like workers co-operatives, which have provided good jobs in areas where they have built up strong supporting organisations, as in the Third Italy [Holmstrom 1989] or the Mondragón group in the Spanish Basque country. They achieve economies of scale and scope because they are linked, not necessarily by being in the same industry or industrial district (though they are largely confined to their regions) but by shared ideology and solidarity. In other areas (like Britain) they have remained marginal, or achieved limited success, as they have in Spanish Catalonia [Holmstrom 1993b].

In India, the usual problems of raising capital and gaining the confidence of private customers are compounded. India's best known workers' co-operative in recent times, Kamani Tubes of Bombay, saved a factory from closure for a few years [Srinivas 1993] and then collapsed. There have been other attempts. In the long run workers co-operatives or some other form of labour-management could have a future in India; not yet.

III Conclusions

All policy options discussed here have been proposed or tried somewhere, as ways to achieve some of the ends we seek (sustained economic growth, employment, well-paid secure satisfying work, etc), especially in the small and medium enterprises where most of the new jobs are likely to be. Would any of the policies, or some combination, work in India?

There are trade-offs and hard choices. If your priority is cutting taxes, you cannot afford to provide 'real services' unless entrepreneurs pay all or nearly all the cost. Perhaps 'human rights' are a luxury which

developing countries cannot afford; the price of growth may be greater inequality. But some of these trade-offs may be illusory. The 'high road/low road' debate is about how hard some of the choices must be: can economic growth and jobs be achieved only by taking advantage of 'flexible' (cheap, insecure, unprotected) labour – the 'low road'? Or is this not only unnecessary but counter-productive, because workers with some security of employment and income are more likely to learn useful skills, build careers, and work 'flexibly' and intelligently for the success of an employer they can trust (the 'high road')?

To block off the 'low road', without pricing workers out of jobs, is a difficult balancing act:

In their formulation of the flexible specialisation model Piore and Sabel stress that the main weapon in competition is permanent innovation, because squeezing labour is not an option...Due to the size of the labour surplus in LDCs [less developed countries], competition emphasises sweating labour rather than innovation [Schmitz 1989:30-31].

In Indian conditions the road cannot be very high for some time, but we should not fall for the argument that India's only comparative advantage is cheap labour, which it should use to undercut all competitors.

To pass rapid judgment on the policy options I listed:

- Protectionism with privileges for small firms has been a failure, though some good came of it.

- Liberalisation to the limit causes more problems than it solves.

- Heavy investment in education and training is a necessary but not sufficient condition for growth; however it takes time.

- Entrepreneurs are not the one critical scarce resource, so it is not worth devoting too much money and effort to finding them.

- Large firms subcontracting to small ones on the open market ('one-night stands') can provide many jobs, mostly low-paid insecure ones, which are worth having where nothing better can be achieved.

- Japanese-style subcontracting – long-term relationships of trust with large firms – can involve small firms in innovation and raising quality, and give their workers some stability. The cultural conditions for it may be hard to replicate in India (or the west). This does not mean it cannot be done.

- Flexible specialisation, or something similar, has developed spontaneously in

a few places and industries in India, but needs a push.

- This push means policies to encourage flexible specialisation. 'Real services', provided by governments, business, voluntary associations, etc, can enable smaller firms to achieve 'collective efficiency' and market-led innovation, leaving small firms free either to supply the large firms or compete with them. For this to happen, firms must offer their workers some security, training, and good conditions. 'Real services' can sometimes make up for the lack of trust between entrepreneurs, but may also build trust.

- Trade unions have a useful part to play in small firms as well as large, but must come to terms with the new competitive environment in which smaller firms operate.

- Labour-managed enterprises (like workers' co-operatives): a good idea, whose time has not yet come.

Flexible specialisation is no panacea, but state intervention of the right kind can help to deliver some of the ends we want, especially jobs, and make the road a little higher than it would be otherwise.

This raises further questions. Should institutes offering 'real services' be organised locally (like the small industries service institutes in India) or by industrial sectors (like the central manufacturing technology institute). The answer is both: Impiva in Valencia and the Steinbeis Foundation in Baden-Württemberg may show the way.

Conventional wisdom, in the flexible specialisation debate, is that 'real services' only work when they meet the expressed needs of local business: otherwise it is easy to waste taxpayers' money on grandiose schemes nobody wants. There are plenty of examples. This argument can be taken too far: unless policy-makers are moderately proactive, and offer entrepreneurs some services they never thought they needed, then opportunities may be lost. It is a matter of fine judgment and intelligent adaptation of what has worked elsewhere. For example, if I am right when I claim 'real services' may not only make up for lack of trust but build trust, entrepreneurs who do not trust each other may not realise the benefits of trust until they see a few striking examples in their midst.

The choices to be made are not just economic and technical, but political and moral. What do decision-makers value most? What trade-offs are they prepared to make (employment for growth; the costs and benefits of sexual or caste

equality). Whether there really are trade-offs is a question of fact, though hard to establish: I have argued that some are not trade-offs at all. Whether they ought to be made – whether they are worth it – are questions of value: moral and political questions.

[An earlier version of this paper was presented at the 14th European Conference on Modern South Asian Studies, Copenhagen, in August 1996. It grew out of my fieldwork in India and Spain. The studies were supported by a research grant from the (British) Overseas Development Administration; and funds provided by the Nuffield Foundation, the British Council, and the University of East Anglia. The views expressed here are my own, and do not necessarily carry the endorsement of any of my sponsors.]

Social Security of Labour in New Industrial Towns

G Vijay

Social security in the formal sector has an institutionalised expression. In case of the agrarian informal sector, pre-capitalist institutions of patronage perform this role of providing social security. In the case of the new industries, the process of flexibilisation has led to the generation of informal segments within the organised sector. Social security in this case is a complex issue since, firstly, it involves migration of labour from rural areas to what are termed as new townships; secondly, the labour in the new industries is recruited on contractual or casual basis; and thirdly, insecurity of employment prevents unionisation of labour. It is in this context that this paper attempts to define social security; conceptualise in what forms and through what institutions it finds an expression; and finally analyse what attributes enable access to these institutions.

I

Introduction

PATTERN of urbanisation is undergoing rapid change in India. Urban planning prohibits setting up of industries in residential areas. Added to this, as part of the industrial policy, industries located in rural areas have been provided with subsidies. These reasons have led to the location of industries outside the cities. The industrialists have strategically located their industries in the rural areas close to the cities. This has best of both the worlds – subsidies and cheap labour because of being located in the backward rural areas and advantage of all the urban infrastructural facilities for being close to the cities. A large number of towns or even large villages in the backward districts around the big cities have emerged as preferred 'new towns' for the location of industries to avail the advantages. The introduction of MODVAT (Annexure 1) and opening up of the economy under liberalisation have together resulted in subcontracting and have led to rapid increase in the number of new industries¹ in these areas, in the recent past. A massive inflow of capital and labour from different parts of the country has converted these rural areas into new townships. While the new industries have been located in these areas, there is a change in the migration pattern from rural-urban to rural-new township, thus, adding a new dimension to the pattern of urbanisation. These new townships with their large populations are developing into economic zones of industrial and commercial activity.

India has witnessed significant structural changes in its economy in the last decade. Economic liberalisation and opening up of the market have resulted in the growth of new industries. Deregulation has acted

as an impetus to the process of change in the technology and business organisation of firms. This has accelerated the process of what has been termed flexibilisation [Nath 1994; Kulkarni 1994]² and therefore 'informalisation'³ in the new industries. The new industries have come into existence in neither the classical urban nor the rural pockets but in new townships. Growth of 'informalisation' coupled with the phenomenon of increasing rural-new township migration in the post-structural adjustment period have made the conditions of labour highly vulnerable.⁴ It can be observed that there is an inclusion-exclusion complex operating in the labour market. The inclusion-exclusion complex is a conflicting process of development. It is a combination of inclusion in the opportunity and social security structures in the new townships for the different categories of rural unemployed on one hand and their exclusion in different forms on the other.

Flexibilisation is operationalised through casualisation and contractualisation of jobs. The casualisation and contractualisation of jobs has led to informalisation of the labour market. In the context of informalisation of the labour market, the formal institutions of social security such as the state, trade unions and skill have a marginal role to play. It is against this backdrop that this paper tries to study the question of social security of labour in the organised sector in the context of its informalisation. This paper tries to present the precarious living and working environments of labour that set in as a result of informalisation; the evolution of new institutions of social security from within to cope with these precarious environments; and various factors determining both the vulnerability of labour and their access to the new institutions of

social security. It needs to be emphasised here that this paper merely presents the existing and emerging institutions and does not take up the question of how far these could be seen as alternative institutions.

II

Methodology

For the purpose of this study, Kothur, a new industrial town is chosen. Kothur is located in Mahaboobnagar district, 30 kilometres to the south-east of Hyderabad, capital of Andhra Pradesh. The district of Mahaboobnagar is well known for its 'Palamoor' labour, with the dubious distinction of witnessing the highest seasonal migration in the country of over one million annually to different parts of the country. Paradoxically, the industrialised areas of the district witness massive inflow of migrant labour from different parts of the country. This paradox poses a challenge to research. The township has a total population of over 8,000 people, with nearly 5,000 working in the industries. Kothur is the most industrialised township of Mahaboobnagar district. The area has 14 medium and large scale industries with a total investment of Rs 16,876 lakh and an employment of 1,396 permanent and casual labour. The area also has 27 small-scale industries with a total investment of Rs 529 lakh and a total permanent and casual labour of 982. The small-scale and the medium- and large-scale industries employ 3,046 and 4,188 workers respectively on contractual basis.

This paper is based on a sample study of a sample of one large-scale, two medium-scale and four small-scale enterprises (Annexure 2). These industries have different modes of business organisations, use different technologies, recruit labour through different methods and produce different commodities.

As stated above, the area witnesses massive immigration. The migrant labour may be broadly classified into two categories based on the distance of place of origin into long and short distance migrants. One finds that in case of the local labour and some short distance migrants, family can be the unit of analysis. However, most of the short distance and long distance single migrants live in groups. Individuals staying under one roof are taken as a unit. This paper is based on a sample of 20 units of short distance, 10 units of long distance migrant workers and five units of local workers. The sample includes two units of casual labour and the rest is contract labour. Study of five permanent labour has also been carried out.

Data pertaining to the working environment has been collected (through structured questionnaire, unstructured interviews) from the workers, the contractors and the managements (owners/managers) of the firms. Data pertaining to housing has been collected through a survey of 30 houses by way of a structured schedule. Data pertaining to water (Annexure 4) has been collected through scientific tests. Three samples of water from tank, agricultural field and drinking water have been collected from various places in the specified manner in six bottles of one litre each. The samples have been tested for the presence of various chemicals, metals and radioactive substances through laboratory tests. The possible diseases caused by the presence of these parameters have been correlated with the actual diseases in the town. The data pertaining to disease pattern (Annexure 5) has been collected from the Employee's State Insurance Corporation ESIC-Med 6 and ESIC-Med 6A forms from the local ESI dispensary. The data relating to consumption expenditure, which also accounts for nutritional status (Annexure 3) have been collected through an unconventional method. The data has been collected from six 'kirana' (grocery) shops where the labour make monthly credit purchases called 'khathas' (accounts).

The rest of the data is based on the author's one-month stay in the Kothur new township. Most of the analysis therefore flows from participant observation.

III

Insecurities of Labour: In order to conceptualise social security, the insecurities of labour need to be comprehended. The labour in the new industries

suffers from different types of insecurities. Besides the well recognised insecurities like lack of security of job, lack of minimum level of wages, housing, health facilities, old age and retirement benefits, there are several other insecurities that are faced by the casual and contract labour. For a newcomer into the labour market, gaining access to food and shelter is a problem. To gain employment, a newcomer needs information and a certain amount of credibility. These factors make the possibility of staying in the labour market insecure. After gaining employment, because of flexibilisation in the form of casual and contract labour, there is employment insecurity. The insecurity of employment implies irregular incomes. With specific reference to contractual jobs, there is no evidence to suggest that a worker has worked for a contractor. The workers often face the prospect of not being paid their wage even after working. Any contingency which requires money makes the condition of the labour insecure. Health of the worker is extremely important in determining the survival of the worker in the labour market. If a worker takes ill, unless there is a mechanism that sustains him, he cannot survive in the new township. If a contract worker sustains injury at workplace, since there is no formal agreement between the worker and the contractor or the management, there is no mechanism to establish accountability. The fallout is the possibility that the worker may not receive any compensation. Further, since there is a perception that migrant workers monopolise the opportunities in the new industries, there is an antagonistic relationship between the migrants and the local labour. Migrant labour therefore must have sufficient base to survive in a hostile social environment.

Flexibilisation which has led to informalisation in the organised industry has generated precarious working and living environment for the labour. These conditions are suggestive of the enormous insecurity that labour suffers in these informal segments of the organised sector. The different insecurities suffered by labour suggest different degrees of vulnerability. In order to conceptualise the notion of vulnerability, there is a need to

analyse the working and living environment of labour.

Working environment: Available evidence (Annexure 2) suggests that the environment of labour at workplace is influenced by scale, mode of business organisation, technology, distance of place of origin of labour, and gender (Table 1).

The working environment of labour is better in the large-scale industries and worse in medium and small-scale industries. It can also be observed that though a higher wage is paid in 'lala'⁵ type of management, long working hours, no holidays, drudgery of work and work hazards⁶ suggest that working environment here is worse. In case of the firm which is managed by professionals but where the owner of the firm pays frequent visits, wage is low, working hours are long, holidays are given but wage is not paid for the period. Further, work here involves less drudgery and relatively less risk. One could therefore say that working environment in such firms is relatively better than under 'lala' type of management. In case of group managed firms, the labour do peripheral jobs like loading and unloading. They are paid minimum wages, enjoy the benefits of ESI and PF, the work involves less hard labour. One could therefore deduce that as the mode of business organisation becomes less personal, better are the conditions of labour.

In the domain of technology one can observe that in firms that involve low level skills which can be picked up in a week such as pharmaceuticals, there is no scope for upward mobility of the workers. It can also be observed that with medium level technology which takes about six months to learn like in textiles and steel mills, there is a scope to enter 'seth's khata'⁷ or become a casual labourer with a fixed wage. In the case of higher level technology which takes two years to learn, like in fibre glass industry, there is the badli system which is also a type of casual labour but with far better working environment than the casual labour in the medium range technology. It can therefore be concluded that more complex the technology or higher the level of skill required, better is the working environment of labour.

TABLE 1: CLASSIFICATION OF WORKING ENVIRONMENT

Factor	Classification
Scale	Large and medium scale and small scale
Business organisation	'Lala' type of management, frequently visiting owner, group managed
Technology	Low level skill technology, medium level skill technology, high level skill technology
Distance	Long distance migrants, short distance migrants and locals
Gender	Male and female

Source: Based on field study.

If one considers the working environment in relation to the distance of place of origin of the labour one finds that though the long distance migrant labour are better paid, given the fact that they have long and compulsory working hours, no holidays, excessive drudgery of work, and prone to work hazards they are the worst sufferers. The short distance migrant labour though low paid, with reference to drudgery of work, holidays, and work hazards are better off. Some industries that started before 1990s employ local labour and the working environment with reference to wage, working hours, social security benefits and work hazards is far better in comparison to migrant labour.

The working environment of contract labour is worse than that of casual labour. The permanent employees enjoy the best working environment.

Finally, gender factor plays a pre-dominant role. Female contract labour is paid low wages, employed in low skilled jobs, in comparison to male contract labour, though they often work for 12 hours a day. However, work assigned to women does not involve hard labour and is not prone to work hazards. There is a trend of feminisation of work in a few industries such as pharmaceuticals, electronics and ceramics.

Living environment: A brief description of the housing, drinking water, nutrition, social and cultural aspects of the workers' living environment presented here. The houses of migrant labour in the new townships are often small and congested. Usually a house implies a long room (10 x 7 feet) in which four to five adults stay. Most of the houses are semi-pucca constructions with tiled or tin roofs. In some houses a 3-feet wall is raised to provide a kitchen. About 80 per cent of the houses do not have bathroom or latrine facilities. In some houses within the small room a corner is used as a bathroom. In others, small thatched roof with curtains is erected outside the house, which is used as a bathroom. There are no sewage or drainage facilities. In rainy season water stagnates. Often a toilet is available half a kilometre away. Most of the houses have electricity. The approach roads to the houses are motorable mud roads.

Safe drinking water is an important factor in determining the living environment of the workers. During the early 1980s, 'Kothur Cheruvu' (tank) was the major source of drinking water. There was also a well in the midst of the village. However, in the late 1980s and early 1990s, due to lack of rains, the well dried up. With the rise of industrialisation, especially the

textile and chemical industries, tank water was completely polluted. In the recent past, the village has got a common tap, the water to the common tap is supplied by an overhead tank. The water samples of the tank and the drinking water have been tested, the results of which are given in Annexure 4. The results suggest that the polluted Kothur tank water has percolated to reach the ground water thus making the ground water unfit for consumption. Since there is no other source of drinking water, all the residents of the township, of which those dependent on industries constitute 62.5 per cent, consume unsafe drinking water. The consumption of polluted water leads to different diseases. The disease pattern (Annexure 5) suggests that incidence of dysentery, other helminths, parasitic skin infections, diarrhoea and enteritis, disease of the teeth, and diseases of bones is high. It needs to be noted that these are all water-borne diseases.

The data for determining the nutritional status of the labourers has been collected from shops where the migrant labour maintain khatahs or monthly accounts. Based on the samples of nine groups of long distance migrants and four of short distance migrants from four different kirana shops, the results about nutrition (Annexure 3) have been arrived at. The results are interpreted ignoring the fact that there is a difference between the work of short distance and long distance migrants. It is also to be noted that due to lack of access to data, the nutritional status of local workers could not be calculated. According to the nutrition experts of the National Institute of Nutrition, in their classification of work as sedentary, moderate and hard, the work of industrial workers falls under moderate work. The experts have arrived at a figure of 2,875 kilo calories as the energy requirement of industrial worker who do eight hours of work per day. The actual energy levels of the short distance and long distance migrants suggest that both the categories are underfed. The short distance migrants get 2,372 kilo calories and the long distance migrants get 2,494 kilo calories of energy. This undernourishment has to be seen in the light of the fact that industrial workers in Kothur work for 12 hours a day. Undernourishment over a period could lead to loss of weight in the early stages. Experts suggest that such undernourishment might not be reflected in any disease pattern but it does incapacitate the workers from performing efficiently due to weakness. However, the disease pattern suggests the avitaminosis and other deficiency states and anaemia

as largely prevalent. This is a direct consequence of undernourishment.

The social context of the long distance migrant labourers is very different from that of the short distance or local labour. For long distance migrants, the first problem they encounter is language. They find it difficult to interact since they cannot communicate. It can be observed that as a result of this, the vegetable vendors and shop-keepers quote higher prices and discriminate against long distance migrant labourers. It can also be observed that in case of both the long distance and short distance migrants, when they enter into competition with the locals at the common taps or at ration shops they face the locals' resentment. However, it can be observed that the short distance migrants have greater interaction with the locals than the long distance migrant labour. As a result there is a lack of sense of belonging to the place of destination even after long years of stay.

Culturally, one finds that the long distance migrant labourers find themselves more alienated. Their festivals, marriage ceremonies, etc., are different from local customs. Upper caste migrants from UP and Bihar complain that they cannot practise the caste system. Some of the migrant labourers, especially the long distance migrants, are unable to reconcile with the changed relationships. The long distance migrants also face cultural shocks like the fact that women come out of their homes and work along with men.

IV Conceptualising Social Security

The above analysis suggests that the casual and contractual workers earn a living under precarious and vulnerable conditions. It is in view of these conditions that the notion of social security needs to be defined from the point of view of the workers in specific situations. Since, most of the labourers have a rural background, their notion of social security is also more rural which, when placed in a new township context, acquires a new meaning. Notwithstanding the fact that there can be no single rural definition of social security, since there are different social and economic classes, social security for the migrant labour working in the new industries is a source of help when in need. This help is available through different modes such as collective and individual. These modes take different forms such as solidarity, patronage, coercive protection, transactional support, political support, and trust, and is expressed through various institutions. There are different possible

institutions providing social security to the workers.

Institution based on solidarity: Social networking is one of the most significant institutions providing social security. Social networking mainly consists of family, friends and relatives. Various identities such as caste, region, workplace, place of residence, class, etc., determine the extent of social networking. As one worker put it, "if we were to realise that one of us is missing, there must be at least a few individuals willing to join in search for him". Thus at a fundamental level, solidarity is the mode of expression of social networks.

A case study can establish the point. Munna Kumar (25) is an upper caste migrant labourer from Chapra district of Bihar. He had come to Kothur five years ago based on the information of a vacancy in one of the industries provided to him by a friend belonging to the same village. After arriving at Kothur, for the first few days before he was actually employed, it was one of his relatives who gave him shelter and food. Munna Kumar joined as a contract labourer in a textile industry, as a helper under a senior printer in printing division. Munna was paid on daily wage of Rs 55 per day. Being a sincere, sharp and cheerful worker, Munna Kumar became friendly with the senior printer and learnt the technique of printing from him. Three years later Munna Kumar became the senior printer. He now works on a regular basis as a casual labourer. He has a fixed wage of Rs 3,000. Once he started getting a fixed wage, his mother, father, brother and his sister have moved to Kothur. His father works as a watchman and his brother as a contract labourer. Sister goes to school while his mother stays at home. He has secured jobs for about nine other members belonging to his caste from Bihar. All of them stay in the same neighbourhood. Some of the workers have brought only their children to be educated, not their wives. However, since the workers work for 12 hours a day, Munna Kumar's mother looks after the children during the day.

Thus, social networking serves the important purpose of information flow. It helps in gaining contacts and employment. It is through social networking that access to housing and shopkeepers is gained. It also helps in getting money when in need. Where the family is missing, social networks assume this role. Social networking also has the important function of generating social and cultural life.

Institution of trade unions: The trade union movement in the area started in the

large-scale industry and it was started by the local permanent labour. Though detailed case studies of the development of the unions cannot be presented in this paper, it can be observed that trade union movement has had an impact on the working environment of the labour. The trade union movement was quite active in the late 1980s and early 1990s. The movement had been initiated by the local and short distance migrant, skilled labour who had worked on a casual basis and demanded to be made permanent. In the mid-1990s the trade union movement started becoming weak. It is interesting to observe that while industries with predominantly local workers co-opted the unions by introducing production incentives, industries employing short distance migrants have weakened the movement through manipulation by splitting the trade unions and by closures. However, more significantly, it can be observed that in those small-scale industries that started in the early 1990s and where there are long distance migrant workers, there are no trade unions. There was an attempt to start a union by long distance migrants which resulted in physical assault on the workers.

Though the trade unions address only the problems of permanent labour, they do have a say in choosing casual labour who are to be made permanent. The casual labour therefore more specifically seek the support of the trade unions. However, more generally, it can be observed that in firms where the trade union movement is strong, the working environment of the casual and contract labour is better because as is well known, it is this section of labour that keeps the firm working when the permanent labour go on strike. To put it another way it is these labourers that break the strikes.

The unemployed youth association is yet another collective institution based on political support. It is called 'Mandala Nirudyoga Sangrama Parishad' and tries to voice the interests of the local educated unemployed. It was started in September 1997. The local youth put forth a demand that 15 members belonging to Kothur and nearby areas be absorbed in one of the firms. On August 31, the organisation held a demonstration ('dharna') before the firm. The local youth feel that neither of the dominant parties, the Telugu Desam and the Congress, has taken up the issue of the local educated unemployed youth seriously. In fact it is stated that the local Telugu Desam MLA intervened and tried to dissuade the youth from struggling. The local youth have approached 'Madiga

Dandora' a 'dalit' (oppressed caste/class) organisation to voice their cause. On January 22, 1999 local educated unemployed youth under the leadership of 'Madiga Dandora' organised a 'rasta roko' (road blockade) in protest. There are, according to an estimate, a hundred educated unemployed youth in Kothur village and 3,000 educated unemployed in Kothur 'mandal' (an administrative unit comprising number of villages).

Institutions based on patronage: On the basis of loyalty and efficiency the employer promotes the worker from contract to casual labour thus decreasing the uncertainty of employment. The owner also provides loans when the labourer is in urgent need of money. This is however restricted to those casual labourers who have long service.

Apart from the patronage of owners patronage of senior workers also acts as a source of social security. In the medium level and high level skill technology industries, there are no formal training programmes for the newcomers. What a newcomer learns depends on his relation with the senior skilled workers. Due to the practice of flexibilisation, there is multi-tasking implying that the workers have to perform different tasks. As a result of this, there is no stability in the type of work performed. This denies the worker an opportunity to specialise which in the long run can improve the working environment of the labour. It is this stability in the type of work performed which patronage by senior skilled workers ensures.

Panchayati institution: The local government referred to as 'panchayat' is one of the institutions which extends political support to labour in acquiring a better living and working environment. The panchayat and more specifically the 'sarpanch' or the president, who is an elected representative, plays a role in securing employment for labour. The panchayat also has a role in providing amenities such as drinking water, roads, sanitation, electricity, ration cards, etc. Thus, by extending such benefits to labour and by making the conditions of labour less insecure, the panchayat has come to acquire the status of an institution of social security.

Institution based on transactional support: The contractor or the middleman is the most important institution in the operationalisation of the system of contract labour. The contractors are mostly relatives or friends of those working in these firms.⁸ In the late 1980s when the contract labour system began, the contractor was an informal institution. However, owing to

pressures from trade unions, labour inspectors and because of inefficiencies felt by the managements and contractors themselves in managing the labour, the system of contract labour has been formalised. According to the procedure, the contractor has to deposit money with the firm to which he supplies labour and with the labour commissioner in order to acquire a licence from the labour office by agreeing to abide by certain rules. These include: payment of minimum wages to the labour as stipulated by law; provision of employees social insurance (ESI) and provident fund (PF) and abiding by the provisions for labour holidays. The contractor has to maintain a roll book in which information relating to attendance, number of hours worked and payment made are to be recorded. These records are occasionally inspected. It is however to be noted that the system of contract labour depends on the informal agreements between the contractor and the labourer and not on the prescribed rules.

The contractor acts as a nodal point between the firms and the labour market. It is however to be noted that a contractor is not an employee of any of the firms. The contractors operate either individually or on partnership basis. The contractors therefore have two roles to play; one in relation to the managements of the firms and the other in relation to the labour. Since there is stiff competition for labour, what the contractor needs to have to attract labour is goodwill. Prompt wage payments, cash loans, etc, earn goodwill. In cases of minor accidents or sickness, treatment is provided by the contractors. It is to be noted that an ensured loyalty from the labour is critical. The contractor affects the social security of the workers, by deciding whom to retain and whom to retrench during periods of fluctuations in demand, and by recommending the labour to be absorbed as casual labour.

Institution of coercive protection: The origins of the mafia can be traced to the early 1990s in the formation of a cricket club by the local youth. The club began as an apolitical institution, with vocal and aggressive youth. A series of instances where it was approached by the contract and casual labour for redressal of grievances made it a strong institution. The cases for which it was approached include cases of moral hazard where the contractor might not pay the wage after getting work from the labourer. The other cases include cases of accident compensation, reinstatement of retrenched labour etc. The mafia has acquired a political status with its leaders taking the

position of presidents of trade unions from outside. This has led to political factionalism in the area.

The leaders of the mafia are drawn from the middle and peasant castes. They are involved in agriculture, real estate and other businesses. The cadre is drawn from the pool of local unemployed youth. While playing the important role of providing some kind of social security to the labour, they extort money from the industrialists in the name of festival 'chanda' (donations) and other development activities. The industries have of late started funding the mafia since they prevent the labour from organising.

Institution based on trust: Shopkeepers act as an important source of social security. The workers approach the shopkeepers for credit purchases of consumer goods and some shopkeepers also lend money. To begin with, generally, workers approach the shopkeepers through the contractors, mafia, or other workers and trust is built later.

Institution based on state support: The assistant labour commissioner's office is the only formal organisation available for the redressal of grievances of the workers. The assistant labour commissioner, who is stationed in Shadnagar which is 10 kilometres from Kothur, can be approached if the workers are not paid minimum wages. The body also carries out inspections of the factories on its own. The institution however is in its dying phase. In a recent government order the state government has removed inspection of industries and industry related matters from the jurisdiction of the assistant labour commissioner and transferred the powers to the assistant commissioner of labour who is situated in the district headquarters. This makes the institution unapproachable to the workers for two reasons. Firstly, the distance between Kothur and the district headquarters is about 70 kilometres, and secondly, since the assistant commissioner of labour is a higher authority in the hierarchy than the assistant labour commissioner, there are greater bureaucratic hassles.

Dignity as a part of social security: When the contract labourer approaches the contractor or when the casual labourer approaches the owner for an advance pay, or is absent for a day, or if commits a mistake at work, the labourers are abused and sometimes manhandled. It can also be observed that in the new industries, highly qualified workers are made to do menial jobs. At common taps, shops or in any other social interaction, any fault on the part of the labourers or his family members

would invite remarks from the locals especially the socially well-off that they and their lives are worthless.

Frequent instances of sexual harassment have perversely given rise to attribution of loose character to young female labourers working in some industries. When asked if they would like to save money and spend it on their marriage, they are agitated and say that considering reputation that labour working in industries enjoy they might never get married. When getting back from the place of work in the evening, one can observe that female labourers are heckled and harassed by the male residents which goes without protest. The victims are usually short distance migrant female labourers in both the above instances.

Dignity acts as an important measure of the limit of security in both the working and living environments. In the light of these instances one could define lack of dignity as human beings coerced by circumstances into leading lives of low self-esteem. Dignity is to be viewed as the limit of social security, the presumption being that where the labourer is ensured of his/her social security, he/she aims at dignity.

It can be observed that most of the institutions of social security have an intrinsically undignified relationship vis-a-vis the workers. One can observe that while the institutions of solidarity, political support and trust have a propensity to grant dignity, institutions of patronage, coercive support and transactional support have a propensity to perpetuate undignified relationships. While some labourers succeed in gaining access to institutions that also make possible dignity, some are compelled by circumstances to take refuge in the institutions that perpetuate undignified relations. It is also in this sense that one can look at the process in terms of the inclusion-exclusion complex.

V

Determinants of Social Security

It can be observed that there is an overlap of functions being performed by the above-mentioned institutions of social security. Not all workers have equal access to all these institutions. It is a combination of these institutions which actually provides social security to labour to survive in the working and living environments generated by the new industrialisation. For each set of institutions, there are certain specific attributes that determine the probability of gaining access.

Class: Labour mostly belongs to the section of small and marginal farmers who

have migrated because of agricultural problems or failure. There are also those farmers who have migrated because of non-viability of agriculture due to subdivision of holdings. The labour market also consists of displaced artisans. However, it can be observed that those that own land or other assets in the place of origin enjoy greater security because the probability that they are provided with money in the hour of grave need is high as the trustworthiness is high. It can also be observed that labour drawing a fixed wage of more than Rs 3,000 and who have a stable job bring their families along. This increases the social security.

Caste: Though it needs to be probed if there is any pattern in the castes that migrate, it has been observed that some of the upper caste labourers from Bihar and UP have migrated to work in the new industries since the caste factor acts as a barrier and does not allow them to work as labourers in the fields in their own villages. It is found that in the recruitment of labour to the industries, caste is not a significant factor. There is a cross-section of castes found in the labour market. It can however be observed that the lower castes, as they are not compelled to reveal their identity and can work and stay in the same places as the upper castes thus enjoying a better status than they would have in the rural areas. Caste acts as an important factor in social networking. Therefore the presence of a particular caste in greater numbers increases the probability of gaining access to this institution of social security.

Gender: Gender also plays an important role in determining access to the different institutions of social security. As is well known, women are a disadvantaged group in our society. It can be observed that generally the local women are excluded from the labour market. But for those who succeed in entering the labour market, the probability of gaining access to all institutions of social security are very high. There are very few long distance migrant women. Generally, these women do not go to work in the industries. Due to cultural factors, women are restricted to their homes and social networks of which family is the only institution available to them. For the short distance migrant women, who form an active part of the labour market, apart from social networking, they get in contact with the contractors and shopkeepers. It however needs to be mentioned that, unlike the local and long distance migrant women who always have families, the short distance migrant women consist of widows, divorcees, and unmarried women.

These form one of the most vulnerable sections of the labour market.

Worker-dependent ratio: The worker-dependent ratio has a significant role in determining the probability of gaining access to social security institutions. It can be observed that most of the migrants come without families and stay with friends or relatives. However, if there is a large number of workers in a family, the probability of being secured increases especially in the case of contract labour. In case of illness or injury, another worker in the family means continued income and hence security.

Distance: Distance has an important role based on which probabilities of gaining access to different social security institutions can be determined. Local labour, as is clear from the explanation of the gender factor, are excluded from this labour market. The image of the local labour is one characterised by laziness, incompetence, arrogance, dishonesty and tendency to unionise. The long distance migrant labourers on the other hand enjoy the image of being hard working, sincere, docile and unorganised. This image helps in gaining access to relatively stable employment. It is the short distance migrant labourers who suffer uncertainty of employment though they have access to greater number of social security institutions than the long distance migrant labourers. It can also be observed that the trade unions prefer non-locals rather than the locals. The locals have a stake in the local politics because they have immovable assets such as a house and therefore they have greater interest in securing a better living environment which is determined by the local government. If the leadership of the local government is given by a different political faction while the trade union is affiliated to another political faction, the loyalty of the locals wavers. The inverse of this logic applies to the local governments which prefer the locals in extending support as an institution of social security.

Skill: Skill acts as an important factor in determining social networks and patronage of the owner or the trade unions. This is because the skilled labourers are generally promoted from contract to casual labour. The casual labour system has two practices. One is where the casual labourers act as contractors who themselves hire four or five workmen and do some job work assigned to them within a stipulated time. Such practices are found in textile industry. The other type of casual labour is the system of 'badli labour'. The 'badlis' are semi-skilled labourers who are

employed on regular basis and who generally assist the skilled labour. These labourers do the skilled work in the absence of the skilled workers. This system has evolved to tackle absenteeism of the permanent skilled workers in the large scale firms. The specific status of the casual labourer however depends on the experience of the worker.

Method of recruitment: There are as has already been stated, three modes of recruiting labour; while one is the permanent labour, the focus of this paper is on casual and contract labour. Depending on the mode of business organisation and whether or not there are trade unions in the firm, the probability that casual labourers have access to the owner and the trade unions is high. Being recruited through the contractor restricts the probability of gaining access to the social security institutions at workplace.

Time: The longer the stay in the place of destination, greater is the number of institutions that can be accessed. For any labourer, generally, social networks are the institutions through which they enter the labour market. However, with longer stay, depending on the combination of attributes, other institutions can also be approached.

It can be observed that while those possessing certain combination of attributes get access to a combination of social security institutions, it is possible that those with a certain combination of attributes are excluded from access to many institutions of social security. One could analyse the process in terms of inclusion-exclusion complex.

Once all workers with these attributes are placed on the scale of insecurity, the factors making the conditions of workers more vulnerable reveal itself. Simultaneously, the study of attributes in relation to the social security institution or institutions a worker approaches establishes the possibility of inclusion into the social and economic structure of new industrialisation. It is however important to note that every worker is identified by a combination of these variables which determines the actual probability of gaining access to a combination of the institutions of social security. Once vulnerability of labour to different forms of insecurities in the working and living environment are assessed and probability of overcoming it are estimated, policy measures can then be initiated either to strengthen the existing institutions or generate new institutions. Measures can also be initiated to directly aid those that are most vulnerable.

VI Conclusion

It is quite evident from the above analysis that the inclusion-exclusion complex operates at different levels. Firstly, with reference to the origin and destination linkage, while some labourers are included in the 'oscillating labour market' ('flexibilisation' from the point of view of the worker), they are implicitly excluded from access to traditional institutions of social security available in the rural areas and the formal institutions of social security often associated with the organised sector. Secondly, with reference to the advantage and vulnerability linkage, while some attributes gain the labour access other attributes make the conditions of labour vulnerable and deny access to the social security institutions that have evolved in the new townships. Thirdly, with reference to dignity and social security linkage, while some labour acquire social security as defined with dignity others are excluded from such an opportunity and are forced to approach institutions of social security that are internally exploitative.

This research throws up some new questions for further investigation. It can be observed that the living and working environment of labour in the new townships are a reflection of the conditions of labour in their places of origin. This question needs further exploration.

It would be interesting to study the relationship between the institutions of social security that have evolved in the new townships and labour. The economic rationale behind each of these institution of social security in the new towns needs further investigation.

It can also be observed that the deteriorating social security of labour is a fallout of liberalisation and opening up of the market. It is to be noted that while multinational firms are visible and therefore have an obligation to maintain certain labour standards, the method of subcontracting of work has resulted in contractualisation of jobs thus making the social security of labour problematic. This link between the new methods of production being adopted by the multinational companies and its impact on the social security of labour would establish a link between the endogenous and exogenous factors. This aspect needs further probing.

ANNEXURE 1: MODVAT

The transition comes at a phase when modified value added tax (MODVAT) was introduced. MODVAT was presented on the floor of the Indian parliament on

December 19, 1985 and was set in motion in the central budget for 1986-87. The underlying objectives were to simplify the existing multitude of rates and exemptions, relieve taxation of inputs in production and to rationalise several schemes such as those for small scale units and for duty drawback (Government of India, Ministry of Finance, *Long Term Fiscal Policy*, 1985, p 36). In many countries of the world where value added tax is charged, it represents duty on difference in the value which the raw materials acquire during conversion into finished goods. However, in India in the 1986 budget, it has been done on a selective basis. It is therefore a local adaptation confined to certain listed commodities only. Therefore instead of using the general term 'VAT', it is being called modified VAT or MODVAT. VAT is a tax on value of output minus input. To illustrate this, we may assume that a manufacturer purchases raw material at Rs 100 and incurs an incidental cost of Rs 30. He charges a margin of Rs 20. His output now comes to Rs 100+30+20= Rs 150 and input in fact, remains at Rs 100, i.e., Rs 50 is left for taxation. For large firms MODVAT meant advantage in shifting the production of inputs. The taxes were borne by the small-scale firms from their profits which meant inputs could be acquired at cheaper rates and tax could also be shifted by opting for subcontracting. This is how MODVAT led to an increase in subcontracting by large firms. As a result of subcontracting of production activity small-scale industries increased phenomenally.

ANNEXURE 2: CASE STUDIES

Vivek Textiles

Vivek textiles is a small-scale firm with an investment of Rs 100 lakh and total employment of 90 workers. The plant is involved in processing and printing cloth. Grey cloth which is the primary raw material is obtained from manufacturers located in other states of India. The firm's annual turnout is 60 lakh metres of cloth print.

The firm is owned and managed by marwadies through the 'lala' type of management, i.e., a single proprietor-owner managing the whole firm on the basis of traditional knowledge system and underlying the principle is to make more than what has been invested.

Production process: The manufacturing process involves six stages. In first stage the cloth is brightened through rubbing, termed scouring; neutralised by applying some chemicals; and then dyed. The second

stage involves rinsing, drying and width setting. The third stage involves printing and allowing the print to mature which is also referred to as ageing. In the fourth stage, the cloth is washed again to prevent fading out of colour afterwards. In the fifth stage, final search for damages is done and it also involves finishing. The last stage involves packing of the cloth in cardboard containers.

The workers are first recruited through the contract labour system as helpers. It is from these contract labour that casual labour are drawn. This shift is considered upward mobility for workers since the mode of payment changes from daily wage to a fixed amount. This shift depends on the efficiency and skill of the worker. It takes six months to learn a skill like printing.

Employment and emoluments: The workers in the textile mills are long distance migrants, mostly from Bihar, Orissa and UP.

One can identify the number of skilled and unskilled labour involved in the production process. The first stage of manufacturing involves two skilled and three unskilled workers; the second stage four skilled and two unskilled; printing three skilled and seven unskilled; ageing one skilled and three unskilled; washing one skilled and two unskilled; finishing and two skilled four unskilled; and packing four skilled and eight unskilled workers.

The skilled labourers receive a fixed pay of Rs 2,000 a month. This pay increases with experience and skill. Skilled labourers like printers themselves act as contractors and unskilled workers are trained under them. While the skilled printers search for better opportunities, the unskilled trainees known as helpers aspire to become skilled printers. The payment for these skilled labourers is done through 'seth's khatha'. These labourers are employed on casual basis and draw a wage of Rs 3,000-5,000 per month, depending on experience and quality of work.

The unskilled labourer are hired on contract basis and are paid a daily wage

Economic and Political Weekly

of Rs 55 for 10 hours of work. The workers are paid half of the actual wage per hour for overtime, unlike the stipulated rate which is double the actual wage per hour. The skilled casual labourers have greater job security than unskilled labourers recruited through a contractor. The skilled labourers have the freedom to be absent for a day or two in a month unlike contract labourers for whom 12 hours of work is compulsory without any holiday including Sundays. None of the workers is provided with ESI or PF benefits. All the workers are exposed to chemicals and dyes which leads to infections.

Sangfroid Pharmaceuticals

Sangfroid is a small-scale industry with 90 workers and an investment of Rs 28 lakh. Sangfroid is owned by a Velama. In this case the owner keeps close control of the firm through a few managers. The management therefore involves frequent visits of the owner to the firm.

The factory mostly does job work and has four divisions: (1) Ponds powder; (2) Johnson and Johnson baby oil; (3) Ravelon makeup powder; and (4) tablets Callal. The basic inputs for the factory are supplied by the sub-contracting firm. The factory uses cheap labour and the raw materials, and carries out the process (according to a given formula) in the appropriate manner by the use of the equipment. We will look at the production process and employment for Callal tablet.

Production process: The first stage is mixing the raw materials in an appropriate ratio; second, it is punched into tablets; third, automated blister packing; four, weeding out the defective strips of tablets. The last job is done exclusively by female contract labourers. The number of contract labourers varies with variation in production.

Employment and remuneration: While the skilled labourers are drawn from coastal areas, contract labourers are short distance migrant female labourers. These workers come from areas like Srikakulam, Vijayanagaram, Rangareddy and border areas of Karnataka.

The process of mixing of raw materials involves seven operators drawing a salary of Rs 2,500 each. The two workers involved in the punching process which includes a punching operator and a helper draw a wage of Rs 2,500 and Rs 1,200 respectively. Blister packing stage involves operator and two helpers, who are paid Rs 2,500 and Rs 1,200 each respectively. The contract female labour employed in the final stage get a wage of Rs 30 for eight hours of work and overtime pay which is

half the actual wage. While the activity of mixing the compounds is the only skilled activity, other works that involve contract labour can be learned in a week. Skilled labourers enjoy job security by way of their skill whereas contract labourers are hired on day-to-day basis. While the skilled labourers are covered under the ESI and PF, the contract female labour have no such benefits. The work involves packing and pasting stickers in the standing position for 8-12 hours which is quite exhausting. Continuous exposure to chemicals leads to skin infections.

FGP Ltd

FGP Ltd, earlier known as Ceat Ltd is a large-scale plant producing fibre glass with a total investment of Rs 4,897.92 lakh. The units has a capacity is 5,000 tonnes per annum.

Production Process: The production process involves eight stages. First mixing calcite, flour spar, boric acid, batch mix, soda ash, iron oxide, E-glass, quartz, and high aluminium, put in the furnace and is melted at high temperature. As the mixture cools down fibre forming takes place. This fibre or thin threads of glass is coated with a binder. The fibre glass is wound and bundles are sent into the cake drying oven and heated. What emerges is a finished product as well as an input for chopped strands and chopped strand mats.

Employment and wage structure: When the company started operations in 1949, five skilled workers were brought from West Bengal. Labour from adjacent villages of Kothur were given employment and training. The workers were taken on contract basis as trainees. After a period of six months they were given appointment letters. After a six months period they were given a confirmation letter and after another six months they were made permanent. Now the company employs about 570 workers of which 150 are permanent staff skilled and semi-skilled; 60 are employed on casual basis, semi-skilled or badlis who can replace the skilled workers, and 70 are managerial staff. Rest of the labour, numbering 300, are employed on contract basis. The permanent workers draw a salary of Rs 8,000-10,000. The badlis who are casuals but are given employment regularly receive a pay of Rs 3,000-4,000. The contract labourers receive a pay of Rs 55 for eight hours of work, they have ESI and PF benefits. Most of the contract labourers are also drawn from the nearby villages. The contract labourers are not used for skilled activity unlike in the small-scale firms.

ANNEXURE 3: NUTRITIONAL STATUS

Commodity Consumed	Quantity Consumed Per Day/Per Adult (Grams)	Energy (Kilo Calories)
<i>Long distance migrant labour</i>		
Rice	500	1,725
Wheat flour	40	139
Mirch	2	5
Turneric	2	7
Jeera	1	3
Salt	20	-
Sugar	50	200
Masala	1	-
Mustered oil	10	90
Potato	50	48
Onion	20	10
Tomato	30	6
Brinjal	50	12
Cauliflower	25	12
Carrot	15	7
Kheera	20	3
Palak	2	1
Banana	100	116
Apple	1 medium size	65
Orange	1 medium size	40
Total		2,494

<i>Short distance migrant labour</i>		
Rice	330	1,138
Wheat flour	160	556
Groundnut oil	30	270
Red gram (kandi pappu)	16	54
Green gram (pesar pappu)	16	56
Bengal gram (cheniga pappu)	8	30
Tamarind	8	6
Chili powder (mirchi)	4	10
Turmeric	8	6

Notes

[This paper was presented at the international seminar on 'Social Security in India' organised by the Institute of Human Development and Indian Society of Labour Economics at India International Centre on April 15-17, 1999. The author is grateful to his supervisors Jan Breman, Henk Thomas and D Narasimha Reddy who in their wisdom sent the author to the field at the right time. The author is also thankful to R Radha Krishna, K Balagopal, Haraopal, M Vanamala, Galab, G Ajay and

Sangha Mitra for their valuable comments. The author is deeply indebted to the people of Kothur without whose co-operation this paper would not have been possible.]

1 New industrialisation refers to industrialisation in the changed structure of the economy, especially industrialisation that is least regulated. New industrialisation also implies industries being situated in new townships, adapting new technologies and new modes of organising production especially in the sense that there are new methods

of organising work and workers.

2 GB Nath (1994): 'Flexibility of Labour Market: Theoretical Approaches and Empirical Evidence from India', *The Indian Journal of Labour Economics*, Vol 37, No 4

Suchita Kulkarni (1994): 'Labour Market Flexibility: A State of Impasse in Industrial Relations', *Indian Journal of Labour Economics*, Vol 37, No 4, John Atkinson defined flexibility at the firm level in terms of core and periphery labour force. With reference to the periphery of the internal labour market, three types of flexibility have been visualised: numerical, functional and financial. The easiest way of achieving numerical and financial flexibility requires the practice of flexible specialisation.

3 Formal refers to recurring transactions, informal refers to discursive transactions. More specifically in the Indian context, segregated or fragmented markets leads to varying patterns of informalisation.

4 Vulnerability is being prone to or susceptible to damage or injury. Vulnerability here means the characteristics of a person or a group in terms of their capacity to anticipate, cope with, resist, and recover from the impact of structural changes. Normally vulnerability is closely correlated with socio-economic position.

5 Lala type of management refers to the proprietor-manager who runs the business based on traditional knowledge. This system is predominant in firms owned by the marwadies.

6 The disease pattern in Annexure 5 suggests that injury of eye, asthma, bronchitis, other respiratory disorders, skin infections, other diseases of the skin, wounds and burn and scalds represent the work hazards.

7 Seth's khata means the account of the owner. It implies that such labour is directly recruited by the owner and the owner is accountable for his payment and other benefits unlike in the case of contract labour where the contractor and not the owner is accountable.

8 It is necessary that those who recommend a certain person as a contractor be not less than managerial cadre.

Organising the Unorganised

Case of Hamal Panchayat

Rajeshwari Deshpande

Social groups working in the informal sector as labourers are among the most neglected groups under the present pattern of capitalist development. The state does not acknowledge their presence, nor does civil society accord them respectable status. Trade unions too have mirrored this attitude and have, by and large, failed to make efforts at organising them. The Hamal Panchayat is a successful attempt at mobilising these workers and has been attempting to create a broad-based political alliance of unorganised workers and the urban poor forcing both the state and civil society to recognise their specific identities and acknowledge their contribution to the economy and society.

THE accepted pattern of capitalist development in India has not only retained conditions of abject poverty; but has also preserved and intensified social and economic inequalities [Bardhan 1997; Kurien 1992]. A complex combination of factors like the state which has sponsored capitalism and yet facing compulsions of democracy and welfare at the formal level; presence of both public and the private sector in economy and their contribution to the capitalist development; disproportionate dependence on the agricultural sector; social inequalities inherent in the caste society in India and the colonial interventions in Indian economy and society has contributed to the lopsided pattern of development in India. The emergence of the informal sector in India and the growing membership of this sector can be situated in the context of capitalist development.

The concept and the extent of informal sector in Indian economy has been studied extensively [Papola 1980; Joshi and Joshi 1976; Davala 1994; Breman 1996; Chandra 1997]. It is estimated that only 9.4 per cent of the total Indian workforce belongs to the organised sector [Datt 1997:5]. Among these the proportion of rural workers, mainly landless agricultural labourers still remains high. However, especially during the last two decades changing economic policies and stagnation in agriculture have led to increased pace of urbanisation and migration of people from rural and semi-urban areas to urban centres [Bhattacharya 1998]. This has resulted in subsequent growth of the urban informal sector. In 1991 20.7 per cent of the total workers were in urban areas. During the last 20 years the lopsided capitalist development also resulted in the disproportionate growth of the service sector in Indian economy [Kurien

1992:341]. At present only 28.7 per cent of Indian workers are in the manufacturing sector. Over 21.3 per cent workers are engaged in trade and commerce and 29.3 per cent are engaged in other (sundry) services [Datt 1997:4]. Most workers within the service sector are unorganised. It is estimated that among construction workers 78 per cent are unorganised while among those engaged in trade and commerce activities 97.9 per cent fall under this category. Among the workers engaged in other services, in both rural and urban areas almost 59 per cent are unprotected. Besides these figures studies have affirmed that there is an evident process of informalisation of the workforce even within the manufacturing sector [Maniben Kara Institute 1994].

Social groups working as informal sector labourers are completely neglected under the present pattern of capitalist development. Informal sector hardly enjoys state support in terms of protection under state laws. Nor does civil society support or sympathise with these social sections, although their number is constantly increasing. The retarded capitalist development in India has failed to execute a sophisticated bourgeois cultural project in India due to a number of reasons [Palshikar 1999]. The plight of the socially and economically marginalised groups gets intensified in the absence of such a project. It is in this sense that unorganised workers prove to be one of the most neglected groups in Indian society.

Trade union activity in India on the other hand has largely focused on workers belonging to the organised sector. It is very difficult to organise unorganised workers because of the absence of clear employer-employee relations, the scattered nature of workplaces, poor resource base

of workers and neglect by the state [Datt 1997:10]. However, the growing proportion of these workers has prompted trade union attempts at nationalising them. Left wing trade unions in India seem to have lost their political support base among the organised workers [Tulpule 1996]. The revolutionary role attributed to the industrial working class seem to be withering away. The trade union movement has thus to look for its support base among the unorganised workers.

HAMAL PANCHAYAT: A CASE STUDY

The Hamal Panchayat, a Pune based organisation of the load carriers/coolies is a glaring example of efforts at political mobilisation within the informal sector. The panchayat started its work in 1955. During the last 40 years it has helped the 'hamals' in Pune and many other parts of the state to lead a financially better and socially secure life.

Hamals or load carriers form a significant group of the urban unorganised workers engaged in service sector. It is estimated that there are more than 200 urban markets in Maharashtra. In all there are more than 200 agricultural produce market committees, around 3,000 public and private godowns more than a 100 railway stations and around 400 ST stands in the state. More than 10,000 trucks are used for transportation of commodities. It is believed that more than 5 lakh load carriers and head loaders (mathadis) work at all these places. Among these around 10,000 are women workers.

Pune is a large scale industrial and trade centre in Maharashtra next only to Mumbai. Naturally, the services of hamals are required at various levels. There are no official figures available with regard to the exact number of hamals working in Pune.

However, the panchayat estimates that there are around 30,000 hamals working in various trade centres in the city. More than 1/3 of these are members of the panchayat. Most of the hamals in Pune belong to the early migrant groups. In a survey of panchayat members conducted in 1985-86¹ it was noted that more than half of the hamals had migrated to the city from the surrounding rural areas of western Maharashtra. A large number of them were from the drought prone districts of the Marathwada region. These families had migrated to Pune during the 1970s.

More than half of the surveyed hamals were marathas. Along with the marathas, Muslims and dalits had also entered this occupation. However there was and is a significant absence of the OBCs among hamals. This can be related to their traditional occupational pattern. Marathas were traditionally engaged in agriculture and were used to intense physical labour. The OBC castes mainly worked as artisans and thus were not used to physical labour. Poorer marathas migrating to urban centres in order to add to their meagre earnings from agriculture; became load carriers. As a result of this the labour market of the load carriers seems to be largely dominated by poor marathas. It is evident not only in Pune but many other urban trade centres including Mumbai.² Marathas in Maharashtra are one of the dominant social groups in the state. Though the hamals hail from economically poor families among the marathas they enjoy a high social status within the caste hierarchy. Their social status and traditional occupational pattern has helped them retain their ties with the villages unlike most of the other migrant social groups. In the survey mentioned above more than 75 per cent of the hamals reported owning agricultural land in their native villages [Deshpande 1989:35]. Thirdly, the hamals in Pune were among the first migrant families coming to the city soon after independence. Therefore they had comparatively easier access to the labour market. These features of the social composition of hamals have significant implications for their unionisation and political role.

Hamals work on a contractual basis. Before the organisation was established the contract between traders and hamals was on a daily basis. Hamals usually worked in gangs and the traders dealt with the leader of the gang. Gangs were formed on the basis of communal ties. There was

absolutely no guarantee of work for hamals, as employer-employee relations were feudal in character till the panchayat started asserting itself around 1960. Besides the work of loading and unloading of goods hamals had to do all sorts of work including sweeping and cleaning shops and godowns, looking after the cattle and even domestic work at the trader's house. These tasks were not accounted for in the wages. Carrying heavy loads was in itself a tedious and dangerous task. The International Labour Organisation has sanctioned a maximum of 50 kg weight to be carried on the back. However, in Indian markets goods are usually packed in 100 kg gunny bags. Not surprisingly, hamals suffer from various back problems which are delittaking over time. Hamals are not able to continue their work for more than 15 to 20 years. Besides, they have to work in poor work environments in godowns, railway wagons and shops.

But more importantly the job of a hamal includes a variety of tasks like sorting goods, mixing different varieties of grain, weighing bags, transporting goods in a bullock-cart, etc, besides carrying loads from one place to another. Rates of payment were never fixed for these tasks. In short, lack of clearcut employer-employee relations; scattered nature of work places; bad conditions of work and complete absence of security were the main features of this labour market.

Under these circumstances it was a difficult task for the Hamal Panchayat to mobilise hamals. The work of the panchayat started with informal meetings of hamals, under the leadership of Baba Adhav, a veteran socialist leader from Maharashtra.³ It took almost 10 years for the panchayat to establish itself as a trade union. In 1959 the panchayat organised its first successful agitation regarding the rates of transportation of goods. Till 1970 the panchayat had spread its work to almost all major market places in and around Pune.

The most popular slogan that the panchayat gave in its initial years was 'I own my back'. Members clearly preferred self-employment and contractual work rather than being wage-employees of the trader. The panchayat felt that contractual relations were more beneficial for hamals as they free them from extra-economic bindings. Also it offered opportunities for more explicit political participation. With these preferences the panchayat basically worked for fixing rates of payment for
